First prize (£100).—Exhibit No. 42 and 43; architect, Q. Mangnall Bluhm, St. Annes-on-the-Sea; builders, Lancaster & Atkinson, Fleetwood.

Second prize (£50).—Exhibit No. 25 and 26: architect, T. Faulkner Shepheard, Birkenhead; builders, Leach & Sons, Cleveleys.

Third prize (£25).—Exhibit No. 11 and 12: architect, Alfred T. Martindale, Bridlington; builder, T. V. Martindale, Bridlington.

Honourable mention.—Exhibit No. 28 and 29: architect, John H. Mawson, Cleveleys; builder, Thomas Riley, Fleetwood.

A. A. MEETINGS NEXT SESSION.

The following is the syllabus of the ordinary general meetings of the Architectural Association for the session 1906-7:—

1906.
Oct. 5—Annual General Meeting. President's Address and Distribution of Prizes. R. S. Balfour.
,, 19—The Architecture of the Roman Empire. Alan Potter.
Nov. 2—Axiality in Architeotural Composition. H. Stannus.
,, 30—The Difficulties which beset an Architect in London, with special regard to existing legislation. William Woodward.
Dec. 14—The Architecture of Sicily. W. Howard Seth-Smith.

1907.
Jan. 11—(Subject to be announced.) Temple Moore.
,, 25—(To be announced.)
Feb. 8—Regent Street. Mervyn E. Macartney.
,, 22—Training and Workmanship. Gerald C. Horsley.
March 8—Spanish Architecture. A. N. Prentice.
,, 22—Sanatoria. Edwin T. Hall.
April 12—Westminster Cathedral. J. A. Marshall.
,, 24—Theatres. Frank T. Verity.

It has been decided that these papers shall be printed *verbatim*, and illustrated, in the Journal of the Architectural Association.

NEW ART GALLERY, MUSEUM AND LIBRARY FOR MANCHESTER.

A special committee appointed by the Manchester Corporation to report upon the future use of the old Infirmary site in Piccadilly recommends the allocation of the ground to the Public Free Libraries Committee and the Art Gallery Committee for the erection of an Art Gallery, Museum and Library. The site contains 19,954 square yards, exclusive of the area already devoted to street widening, and it was purchased by the Corporation for £400,000 under the terms of the Act of 1903. Vacant possession is expected in two or three years. The Reference Library is at present housed in the old Town Hall, in King Street, but that building has been sold, and possession must be given not later than 1913. The Art Gallery in Mosley Street has long been inadequate, and no satisfactory addition to the buildings is feasible. The Piccadilly site will allow of the erection of a building which shall be worthy of the city, and the recommendation of the committee is almost certain to be adopted, except, perhaps, so far as regards the Museum portion of the scheme. In the Owens College Museum Manchester possesses one of the finest institutions of the kind out of London.

This plan will make it necessary for the proprietors of the Royal Exchange to turn to an addition of the present building for an escape from the congestion and overcrowding of which so much complaint is made.

The suggestion for a new Exchange upon the Piccadilly site never secured much support because of the great dislocation of business arrangements which the change would have involved.

BLACKFRIARS BRIDGE.

A Note on the Old and New Structures.

Blackfriars Bridge has come into public notice recently by reason of the project to widen it in connection with the over-bridge tramway service. The *City Press* therefore takes the occasion to give an account of its erection. The present structure, which was opened in 1869, was designed by Joseph Cubitt, who was successful in the open competition instituted by the City Corporation when it was decided to rebuild. The bridge comprises five spans, and cost, approximately, £270,000. The piers and abutments are of granite, while in the decorative work Portland stone and bronze are employed. Outstanding features are the red polished granite columns below a parapet of Gothic design. One detail about the bridge not generally known is that on the sea side are figures of sea birds carved in stone, while the river side is similarly adorned with land-loving bipeds.

A 1759 Competition.

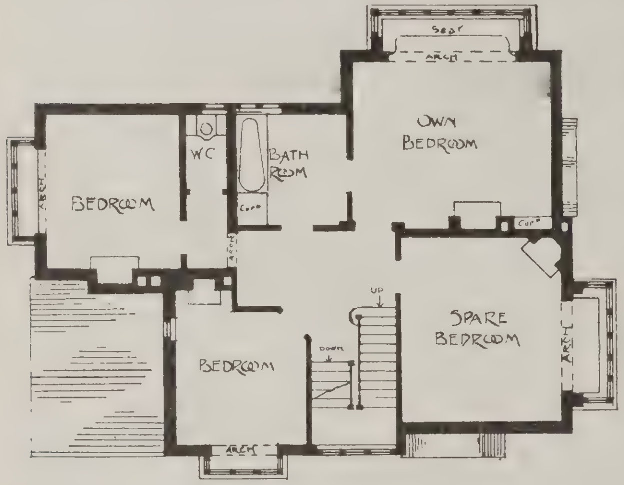
The old bridge, which the present bridge replaced, was the subject of a controversy in which Dr. Johnson was a noted participant. In 1759 the Corporation decided upon the erection of a bridge at Blackfriars, and, according to custom, invited designs. About twenty architects competed, and amongst the number were Robert Mylne, Smeaton, and Dr. Johnson's friend, Gwynn, the last-named being highly esteemed as the author of various improvements in the City. The Common Council, however, accepted the design of Mylne, who was unknown in London, although he had studied in Italy, and gained the first prize at the Academy of St. Luke. The feature of the design was the use of the elliptical arch, a feature which gave rise to much adverse comment, fears being expressed as to its practicability and safety.

The Heavy Flounderer.

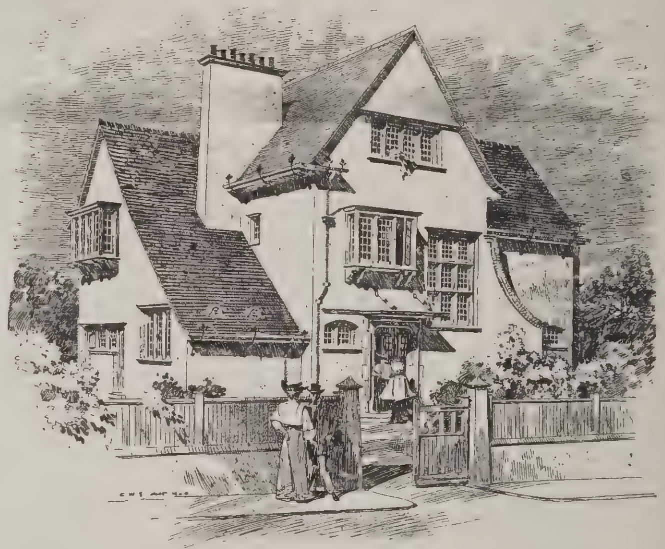
Dr. Johnson was foremost in the fray, floundering amid the technicalities of architecture in defence of his friend, who had used the semi-circular arch in his design. By all accounts, the Doctor showed his palpable ignorance regarding matters architectural, endeavouring to show that the pointed arch was inherently weak and inefficient. In the process he turned the thunder of his wrath against Mylne, disparaging him and his work, and stopping at nothing to bring about the reversal of the decision of the Corporation. He went so far as to assert that Mylne only succeeded in becoming the prizeman at Rome because his compeers were boys, and that architecture had sunk to a frightfully low ebb at Rome.

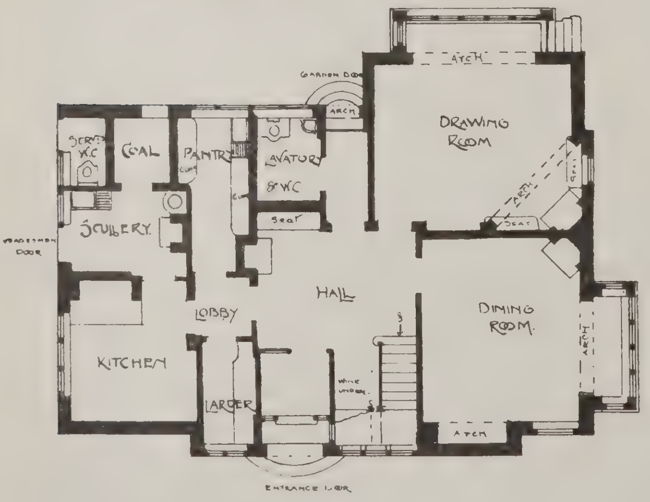
The last of a series of letters on the subject from the pen of the famous Doctor is worth an excerpt: "I again venture to declare, in defiance of this contemptuous superiority, that a straight line will bear no weight. Not even the science of Vasari will make that form strong which the laws of Nature have condemned to weakness." So the worthy Doctor pitted himself against the architect, holding his belief to the last, and predicting failure and disaster. Controversy once aroused was difficult to quell, and almost everything in connection with the project was disapproved. In spite of all, however, Mylne went steadily on, and finished his work in 1769, when the bridge was acknowledged to be a success.

The Baldachino at Westminster Cathedral is now nearing completion. It is supported by eight columns 14ft. in height, which rest on pedestals rising 6ft. 6ins. The columns are of yellow Verona marble. Five steps of white statuary lead up to the altar, which is formed by a solid block of grey Cornish granite; behind it runs a low wall of Greek cipolin.

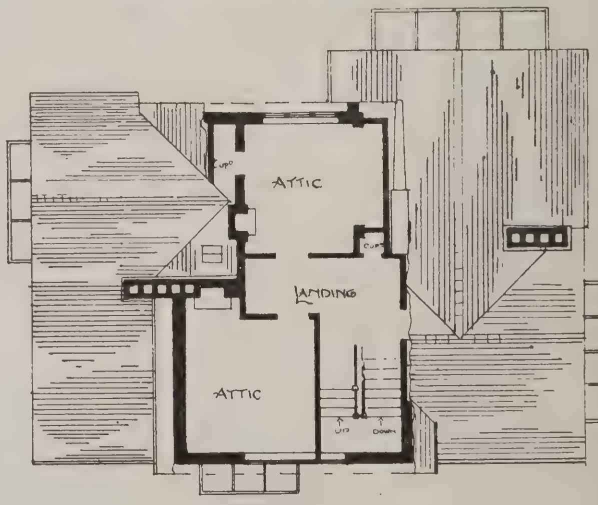


FIRST FLOOR PLAN





GROUND FLOOR PLAN.



ATTIC AND ROOF PLAN

HOUSE ON THE CHART, REIGATE. C. E. SALMON, ARCHITECT.

This house has been erected on the Chart, one of the highest parts of Reigate, and commands extensive views of the North and South Downs. The exterior is rough-cast a cream colour (gained by using a particular kind of sand). All exterior woodwork is painted dark green. The porch is built in Box Ground Bath stone with an oak hood. The roof is tiled with Collier's hand-made sand-faced tiles, which tone to a dark colour. The gutter brackets and other ironwork were wrought by a local smith. In the hall and dining-room plain square panelling and oak flooring are employed, and an ingle-nook is obtained in the drawing-room without the usual external excrescence. The fencing and gates are of oak, the fencing being built on a rough-cast wall with a brick coping. The builder was Mr. J. Waycott, of Reigate, and the architect Mr. C. E. Salmon, of Bell Street, Reigate.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Municipal Architectural Work.

Writing in reference to the enquiry under this heading on page 91 of our issue for August 22nd, A. S. says: "There is only *one* examination held by the Incorporated Association of Municipal and County Engineers, not two, and when you have passed you are entitled to become a graduate (provided you are proposed and seconded); but to become an Associate you must hold an appointment in a municipal office, and to become a member you must hold a *chief* appointment in a municipal office."

Destroyed Indentures.

YOUNG ARCHITECT writes: "My indentures have been accidentally burned, together with other documents. What should I do to get same replaced? The principal with whom I served is in America, and the witness to the signatures is dead. In the event of my having new indentures, would it be legally correct to date the signing of them back to the original date of signing the destroyed one?"

If your indentures are still running, it is quite easy to have another set drawn up and executed at the present date—the loss of the original document being recited in the new deed. If the indentures have been duly served and are now expired, the only course I can suggest is that your late principal should give you a certificate to the effect that you did serve with him from such and such a date to such and such a date, and he might, if desired, add the necessary words to state that he understands the original document has been burned, and to express his satisfaction with your conduct during the period named.

F. S. I.

Adjoining Owners and Use of Chimneys.

S. H. S. writes: "A certain corporation leased seven sites to A, who built thereon seven houses. It was A's intention to take the adjoining sites; therefore in building his gable the chimneys for the eighth house were carried up as well as those of the seventh house. But B came along and the corporation leased to him the eighth and other sites. B put up his houses and used the chimneys that A had erected. (1) Is B legally liable to pay for the adopted chimneys? (2) What action can be taken in the absence of an official valuation? (3) The town clerk refuses to act as 'collector' in the matter. Is he right in this? I myself am very doubtful about it."

I am of opinion that:—(1) A's remedy is against B only, and that B is legally liable. (2) That A should claim the sum that he is advised is reasonable from B, and if not paid he should take action to recover it in the County Court, producing his lease as documentary evidence, and summoning the borough surveyor as a witness as to value. (3) The town clerk is quite right in refusing to act as "collector." You should endeavour to keep the issue as simple as possible—do not "cloud" your evidence by introducing any more of the negotiations and correspondence than is unavoidable.

F. S. I.

Ridding a House of Black Beetles.

DEVON writes: "Can you suggest any ready means of getting rid of black beetles in a detached two-storey house in the country? It is comparatively new, and has just been repapered and painted."

There is no "royal road" to cleanse a house of black beetles, but almost any of the much-advertised preparations will prove efficacious in keeping them down. All crevices should be stopped in which they can penetrate, and all cupboards, &c., should be kept scrupulously clean.

F. S. I.

Fees for Valuing and Surveying Building Estate.

LONDON.—CONSTANT READER writes: "What are the recognised charges for—(1) valuing a building estate prior to purchase or development, and (2) negotiating the purchase? (3) Would the fees be payable in the event of the purchase not being completed? (4) Negotiations with adjoining owners; (5) special negotiations with local authorities; (6) surveying estate; (7) taking levels and preparing drawings of schemes of development and plans of roads and sewers and obtaining approval of local authorities; (8) preparing contract drawings, specification, and obtaining tenders and superintending the work, &c.; (9) taking out and providing bills of quantities."

The Royal Institute of British Architects has sanctioned a scale of professional fees, and it would be well for you to procure a copy (address, the Secretary of the Institute, 9, Conduit Street, Hanover Square, London, W.), or an extract from the scale may be found in "Laxton's Price Book." To answer your queries seriatim:—(1) 1% to £1,000 and $\frac{1}{2}$% above that to £10,000; by special arrangement for small or very large sums. (2) Charge according to circumstances and labour involved. (3) Not unless you are specially retained. (4, 5, 6 and 7) As No. 2. (8) 5% on total cost, besides travelling and incidental expenses—2$\frac{1}{2}$% of this fee is considered to be for drawings and specification, &c., and a further $\frac{1}{2}$% for obtaining tenders. (9) Quantities are usually charged for at the rate of 2$\frac{1}{2}$% for works up to, say, £2,000; 1$\frac{1}{2}$% up to £10,000, and 1% for larger works. There is, of course, no law making any of the above charges compulsory.

F. S. I.

Our Plates

Hillbrook Place, Iver Heath, Bucks.

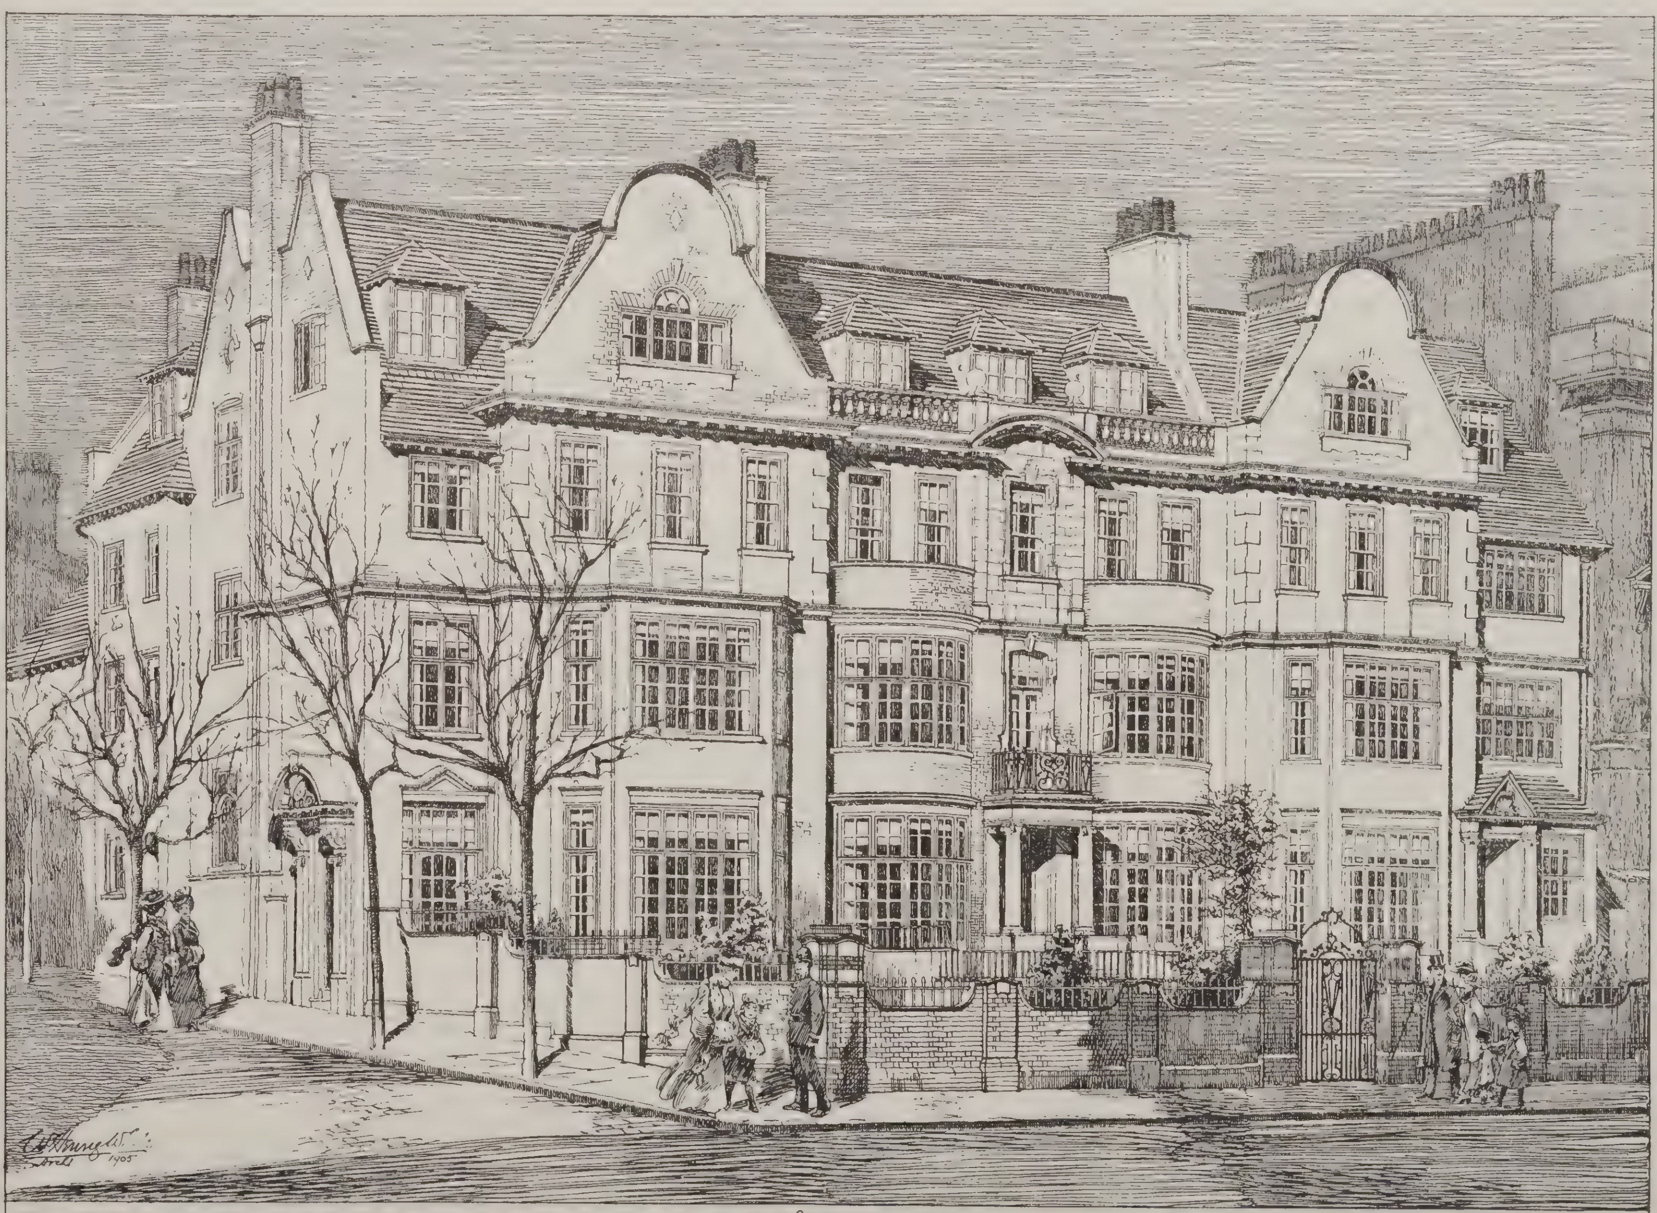
This house has been designed for a fine site in Buckinghamshire. The scheme may be said to have been dominated by the desire that the house should be plain and unpretentious in every way, with large rooms and uninterrupted floor spaces. Ample bedroom and service accommodation were required, and, in addition, a broad corridor on ground and first floors was considered an essential factor in the scheme. The plan has therefore been evolved upon these lines, and through such practical considerations. For the materials, local hand-made facing bricks were proposed for the walls, making use of varying colour and fired headers to obtain some play in surface and tone. Hand-made tiles with a rough surface and uneven tone were intended for the roofs. Internally there would be little ornamentation other than simple plasterwork, reliance being placed upon the proportions of the rooms and generally plain character of the design. The architects are Messrs. Forsyth and Maule, FF.R.I.B.A., of London, W.

A PLEA FOR FORMAL GARDENING.

It is an interesting fact that William Morris, writing so far back as the end of the seventies, attacked landscape gardening, not for its artificiality, but for its lack of order and design. He knew that no work of art should put on the airs of Nature; that, as houses ought not to be built to look like caves, so gardens ought not be designed to look like flowery meadows or stretches of woodland. Landscape gardening, which came into fashion when we were building the ugliest houses, was an attempt to ignore the existence of the house. Shrubberies were grown to hide it as best they could, and paths twisted about in a helpless reluctance to approach it. But, when men built beautiful houses, they had no desire for landscape or for any kind of wild gardening. They were proud of their handiwork and did not look to Nature or any pretence of Nature to conceal it from them. So the house and the garden were all part of one design, of which the house was the centre, giving a purpose and meaning to the whole; and this idea that the house shall dominate and explain the garden is the principle upon which all formal gardening is based, whereas all wild gardening is based upon a despair of the house and a desire to ignore it.

Now that we are beginning to build beautiful houses again, we are beginning also to design formal gardens to suit them. But, if we make up our minds for a formal garden, we must understand clearly what are the proper limits of its formality; and, in the first place, we must know that a formal garden does not mean formal flowers. The best gardeners now delight in growing plants in conditions that will show off their beauty to the best advantage. It is the business of formal gardening to do this; to use its material so that its characteristic beauty may be displayed to the best advantage.

It is a main principle of formal gardening that a gardener may do anything he chooses with his materials to increase their use or beauty, but that he must not play tricks upon them merely to show how far he can pervert them from the course of Nature. Thus, where a tree or shrub is grown for its own sake, to clip it is to spoil its natural beauty for no reason. But, when trees or shrubs are used to make a hedge, clipping increases their beauty as it increases their use. A hedge, properly used, is only a kind of living wall, and you can see at a glance that it is grown not for its own sake, but to serve as a wall. So, whatever treatment makes a better wall of it is justified; and the formal gardener will not try to conceal his living walls, but will make them play a part in the beauty of his design. Everyone must feel the charm of well-kept yew hedges in an old garden: they are a sign that order and peace and a delight in beautiful things have been long established there. This is the secret of the charm of formal gardens, and it is a charm that we cannot find in any flowery wilderness, still less in the most cunning imitation of one.—Extracts from an article in the *Times* for Saturday last.

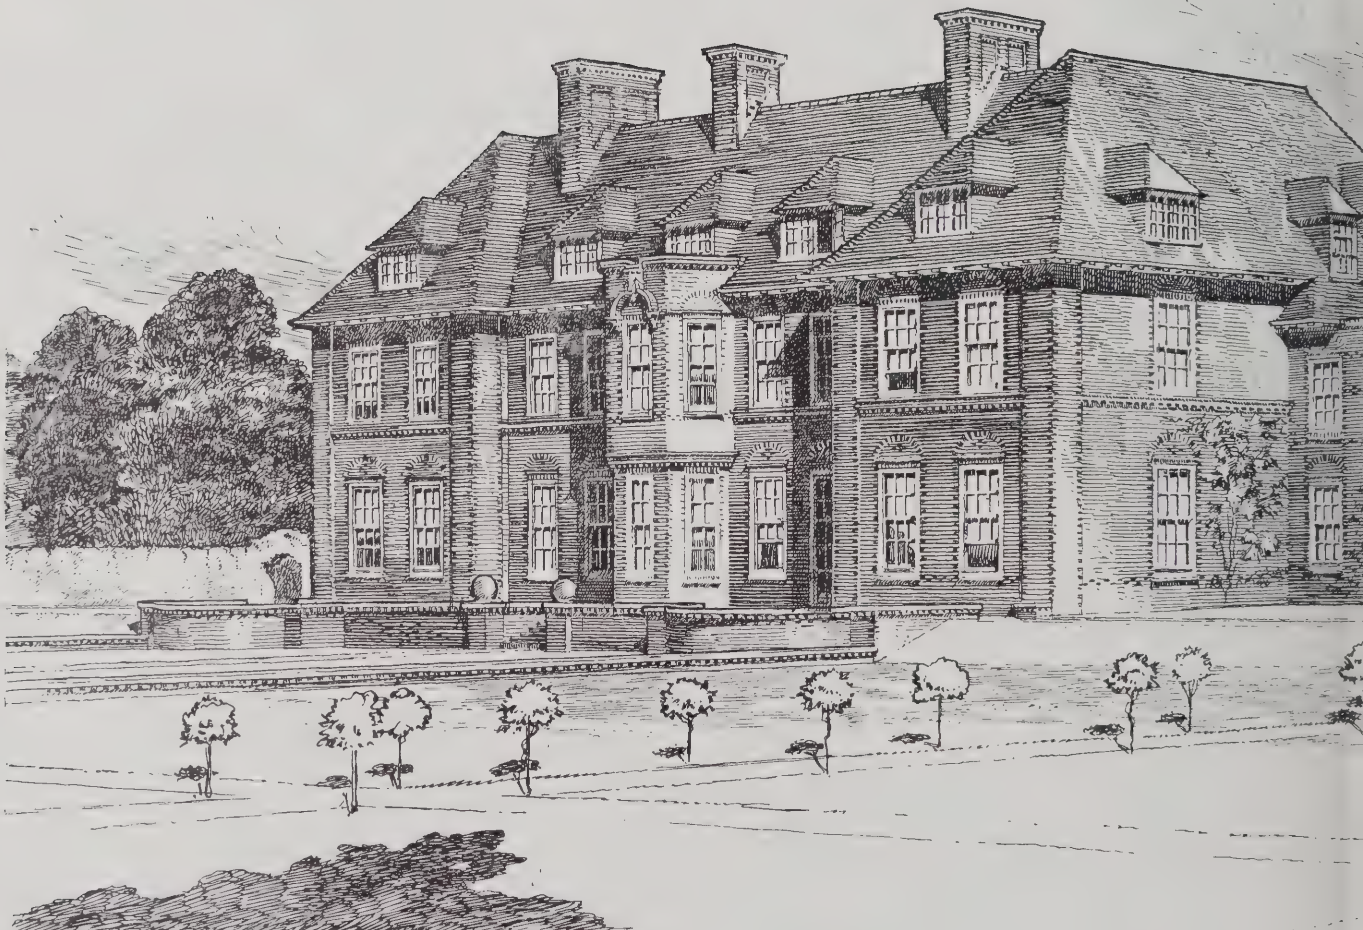


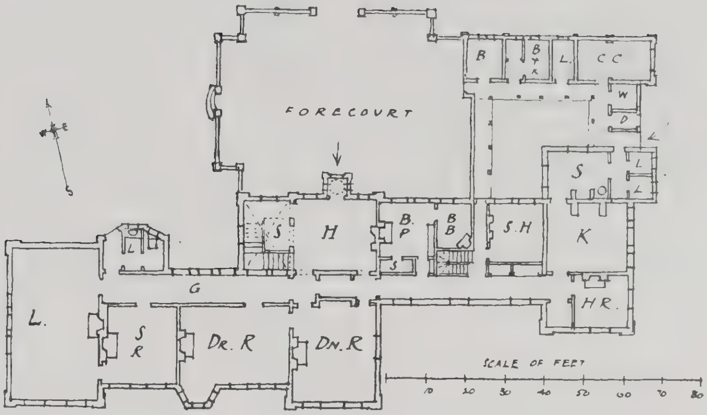
THREE HOVSES, NORTH GATE, REGENT'S PARK: N.W.

W. HENRY WHITE F.R.I.B.A. ARCHITECT
14 CAVENDISH PLACE CAVENDISH SQUARE. W.

Supplement to
The Builders' Journal and Architectural Engineer,
Wednesday, September 5th, 1906.

HILLBROOK PLACE
IVER-HEATH, BUCKS.





GROUND PLAN.

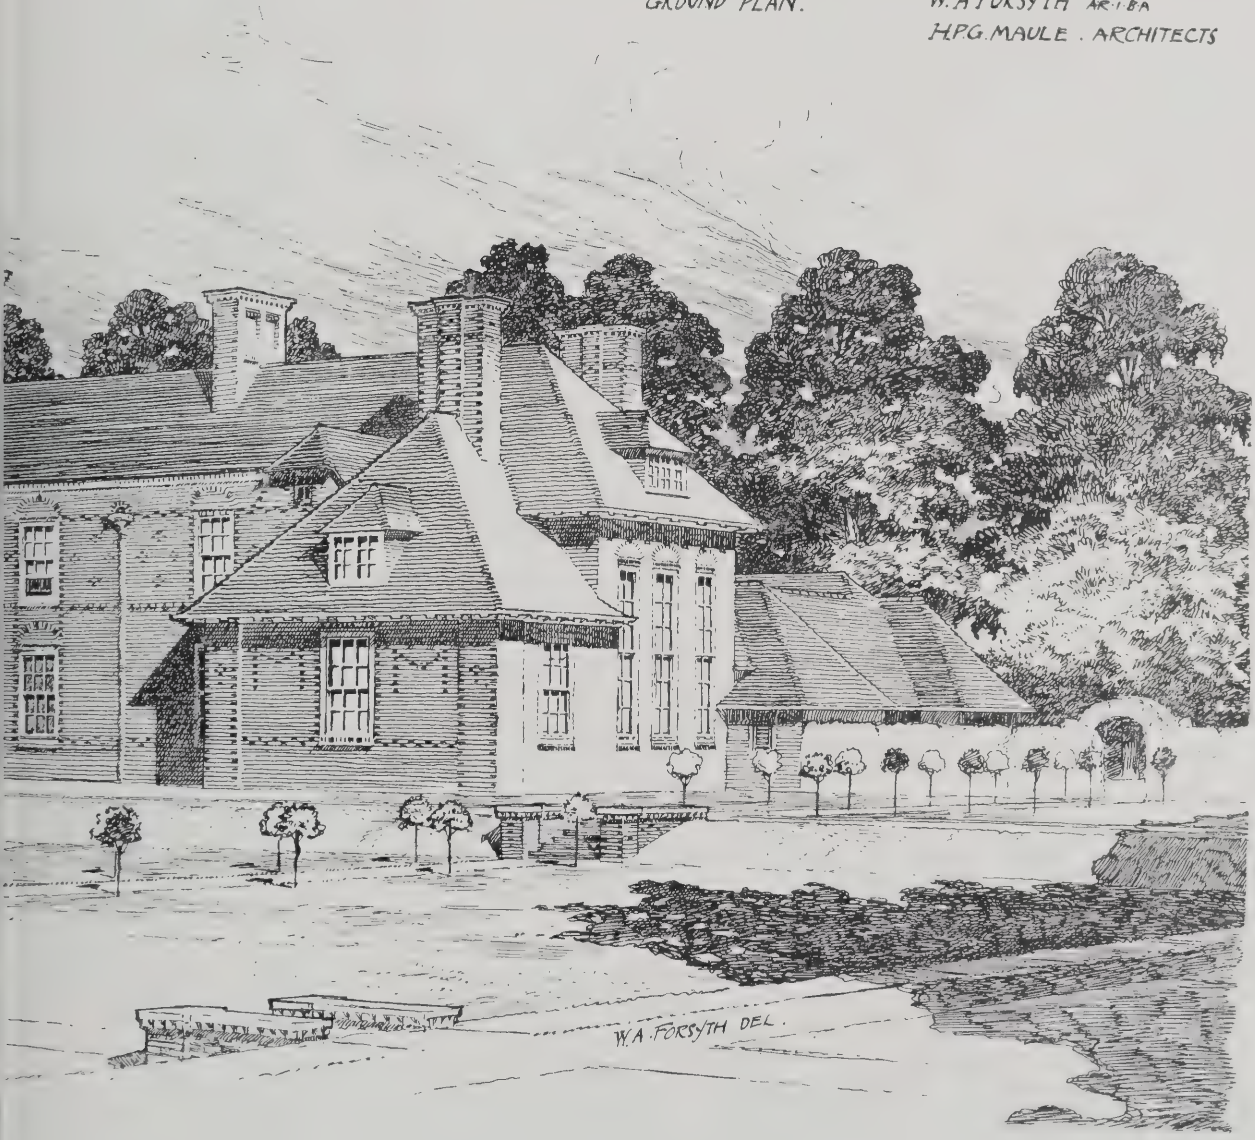
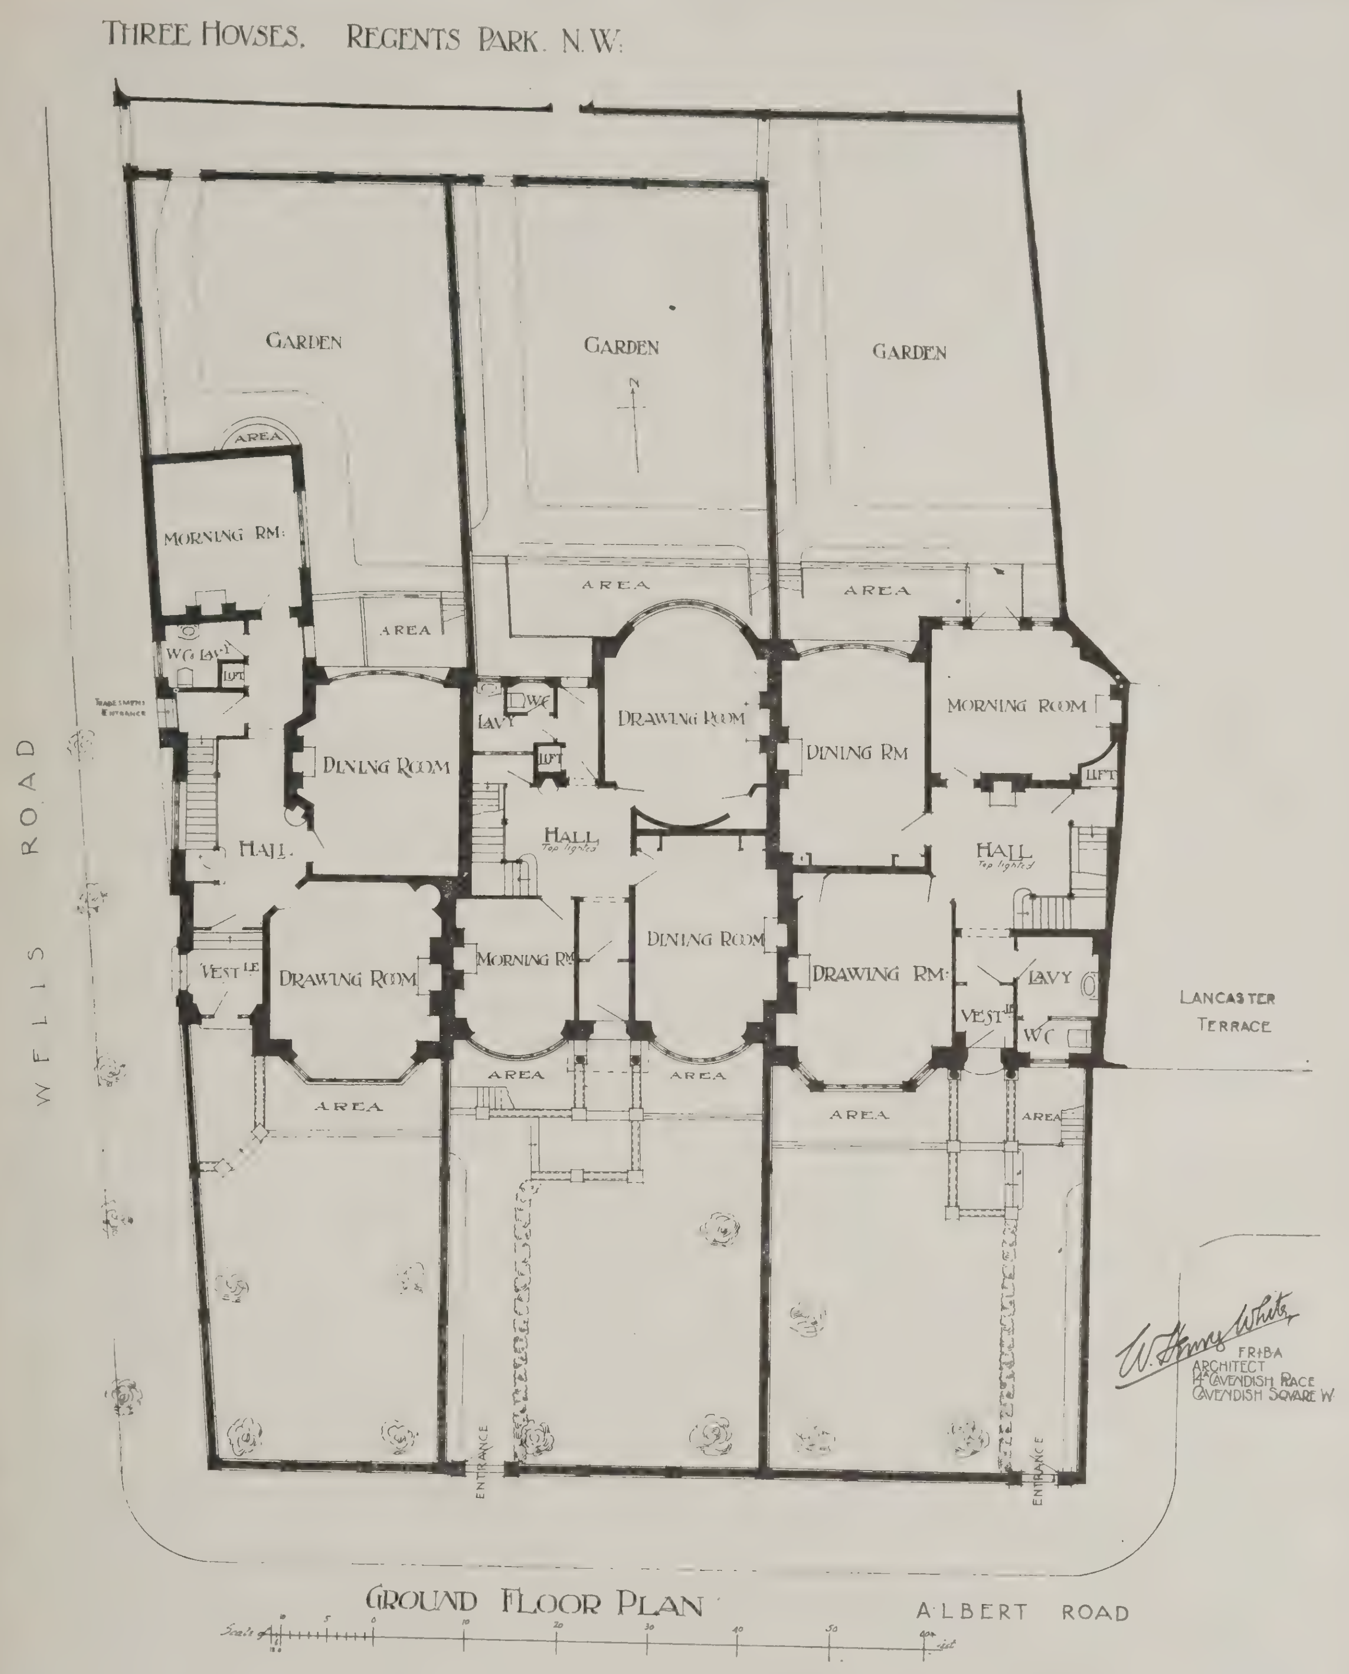
H.P.G. MAULE. ARCHITECTS



W.A. FORSYTH DEL.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS



The property on the north side of Regent's Park is undergoing great changes, and efforts are being made to improve the character of the neighbourhood by removing the old commonplace houses and terraces, which were ill-planned and of no architectural character, and substituting in place of them good-class town houses of the rental value of £300 to £400 per annum. The three houses here shown face south and overlook Regent's Park. They were built by Messrs. Holloway Brothers, of Belvedere Road, S.E., from the designs of Mr. W. Henry White, F.R.I.B.A., of No. 14A, Cavendish Place, W. The houses are faced with Lawrence's bright red bricks, with Portland stone dressings and tiled roofs; the interiors have been carefully arranged and are excellently finished. The ground floors are well above the garden, so that the basements are only half "underground." By sloping the paths and dividing up the steps, objectionable flights to the front doors have been avoided. It will be noticed that the plan of each house is distinct, thus avoiding monotony, and by recessing the centre house the grouping has been relieved from the flatness of the ordinary terrace effect. The perspective view was hung in this year's Royal Academy.

Notes and News

Two new Branch Libraries at Liverpool are to be built, the cost of one of which (at Walton) will be borne by Mr. Carnegie.

In Yattendon Parish Church recently Sir Arthur Rücker unveiled a marble tablet to the memory of the late Mr. Alfred Waterhouse.

The Savoy Hotel Restaurant has just been redecorated. Formerly the prevailing tone was dark mahogany, but this has now given place to a soft white, which is most effective.

New Municipal Buildings at Battersea.—On Saturday last the first portion of the new baths, museum and branch library in Plough Road was opened to the public. The total cost has been between £10,000 and £11,000, and the work has been carried out by direct labour.

Messrs. Carter & Co., the well-known makers of floor and wall tiles, &c., have moved their London office from 43, Essex Street, Strand, to 29, Albert Embankment, S.E., where they have more commodious premises, both for stock and for displaying their glazed fireplaces, dadoes, &c., in the showrooms.

New Libraries in Islington.—Islington will shortly have a new central public library and four branches. One of these, the north branch, in Manor Gardens, Holloway Road, is now all but finished; it will be formally opened on September 20th. This library is interesting as being on the open access system.

A £20,000 Housing Scheme.—The Sunderland Rural Council propose to obtain land at Ryhope Colliery and Tunstall, two pit villages, where they will erect 96 dwellings, in 12 blocks of eight, thus affording accommodation for 528 persons. The scheme will involve £20,000, which sum is to be raised by loan.

Ulster Society of Architects.—At a special general meeting on August 24th a resolution was unanimously passed re-affirming the resolution of July 9th last, that the Society's affiliation with the Royal Institute of the Architects of Ireland should be terminated, and instructions were given to the council to apply for direct affiliation with the Royal Institute of British Architects. (See p. 102 of last week's issue.)

Restoration of Carnarvon Castle.—One of the architects of the Board of Works has been commissioned to pay a visit of inspection to Carnarvon Castle this week for the purpose of preparing a report with a view to the continuance of the scheme of restoration which has been in progress for many years. It is generally expected that the Government may see its way to make a substantial grant at an early date to carry on the work.

York Architectural Society: Visit to Hull.—The York Architectural Society recently paid a visit to Hull in order to inspect several important buildings recently erected there. The first building visited was the new art school, for which Messrs. Lanchester and Rickards were the architects. It cost about £16,000. The new central public library was next visited. This has been built from designs by Mr. J. S. Gibson, F.R.I.B.A., at a cost of £21,000, the principal frontage being in Albion Street. Finally, the visitors inspected the new baths in Beverley Road, built from the designs of the City Engineer, Mr. A. E. White, A.M.I.C.E.; the men's swimming bath is 100ft. by 35ft.

Stonework Decay in Sea Air.—The stonework of Holy Trinity Church, Hastings, which has suffered through exposure to the sea air, has been renovated by Messrs. R. Francis & Son, of Eastbourne, who renewed the decayed Caen stone at the west doorway and rose window, and reinstated it with Monk's Park stone, the whole being treated with "Fluate," to harden and preserve the new work. The renovation has been carried out under the supervision of Mr. Henry Ward, A.R.I.B.A., of Hastings.

The Restoration of York Minster.—The Dean of York has issued another "Occasional Paper"—the ninth—on the progress made with the restoration of York Minster during the past twelve months. Chief attention has been given to the restoration of the great west window (which measures 54 ft. 4 ins. in height, and 25 ft. 4 ins. in width, containing 958 superficial feet of glass), and the completion of two of the flying buttresses. As regards the west window, large plates of "Hartley's rough patent glass" had been inserted in order to protect the mediæval painted glass, but these plates had been fastened into their position with iron bars, which had contracted and expanded, breaking the rough plates and splitting the stone mullions. These latter have now been thoroughly repaired, and the rough glass removed and replaced by clear "crown glass," in diamond quarries. Mr. G. F. Bodley, R.A., is the architect in charge.

Leeds Institute, Department of Building.—The results of the May examinations in building construction, just issued by the Board of Education, show that out of 101 students examined in this department, no fewer than 87 have passed; 36 of these obtaining first-class certificates and 51 second-class, there being only 14 failures. Successes have been gained in all four stages of the subject. This is the finest result yet obtained at the Leeds Institute in this subject, the average for the last two years being about 80 per cent., while this year's results are well over 86 per cent. There were 807 class students in this department last session. Next session's opening lectures are to be given on September 10th and 12th respectively, at 7.30 p.m., by the head of the department (Mr. James Neill), the subjects being: 1, "The Training of the Modern Architect"; 2, "The Education of the Builder." Admission to the lectures is free.

An Open-Air School.—A guide to Garden City (Letchworth) has been issued from the offices of the First Garden City Co., Ltd., 326a, High Holborn, W.C., price 2d. (post free 3½d.). It gives detailed particulars of the estate and is very fully illustrated with photographs and drawings of houses built there. Among the illustrations are an elevation and plan of the open-air school now being erected at a cost of £25,000; it will not be completed until this time next year. The plan shows a semi-circular corridor, covered in on top but open on one side, and this we take to be equivalent to the "classroom." The corridor runs round a "cloister garden" and has recesses forming "comfortable dining-places, while the hall and west alcove (though not entirely shut in) give ample scope for the joys of the fireside. Books and other necessaries, when not in use, can be placed in watertight cupboards." In addition, an oval swimming bath, with dressing-rooms, and a kitchen block are comprised in the scheme.

THE CATARACT DAM.

A Great Work.

For the water-supply of Sydney the Cataract Dam, the biggest in Australia, is now in course of construction. It is a huge wall of Cyclopean masonry and concrete, rising 154ft. sheer from the river-bed, and extending 40ft. below it into the solid sandstone: almost vertical on the up-stream face and sweeping away with a great bold curve on the down-stream, till the wall has increased from a thickness of 16ft. at the top to 160ft. at the river-bed level. It will impound 21,411,000,000 gallons, or nearly 1,000 days' supply for Sydney, and the cost of constructing it will be £325,500.

Its Construction.

The up-stream face is constructed of moulded blocks of concrete 5ft. by 2ft. 6ins. by 2ft., and the down-stream of a layer of bluestone concrete 6ft. thick; while the body of the dam consists of rubble, blocks of roughly-hewn sandstone weighing from three to five tons, set in cement mortar, and packed in with bluestone concrete—142,300 cubic yards of solid masonry and concrete, containing 105,000 casks of cement. One feature breaks the monotony of the huge expanse of wall—the outlet works tower on the up-stream side, on which are placed at varying heights the sluices, which admit the water into two great wells, and thence into the 48-in. diameter outlet pipes.

The mass of material forming the dam has been handled entirely by electric-driven machinery—electric-driven mixers for the concrete and mortar, overhead cableways to run out the stone and concrete, electric cranes to place it.

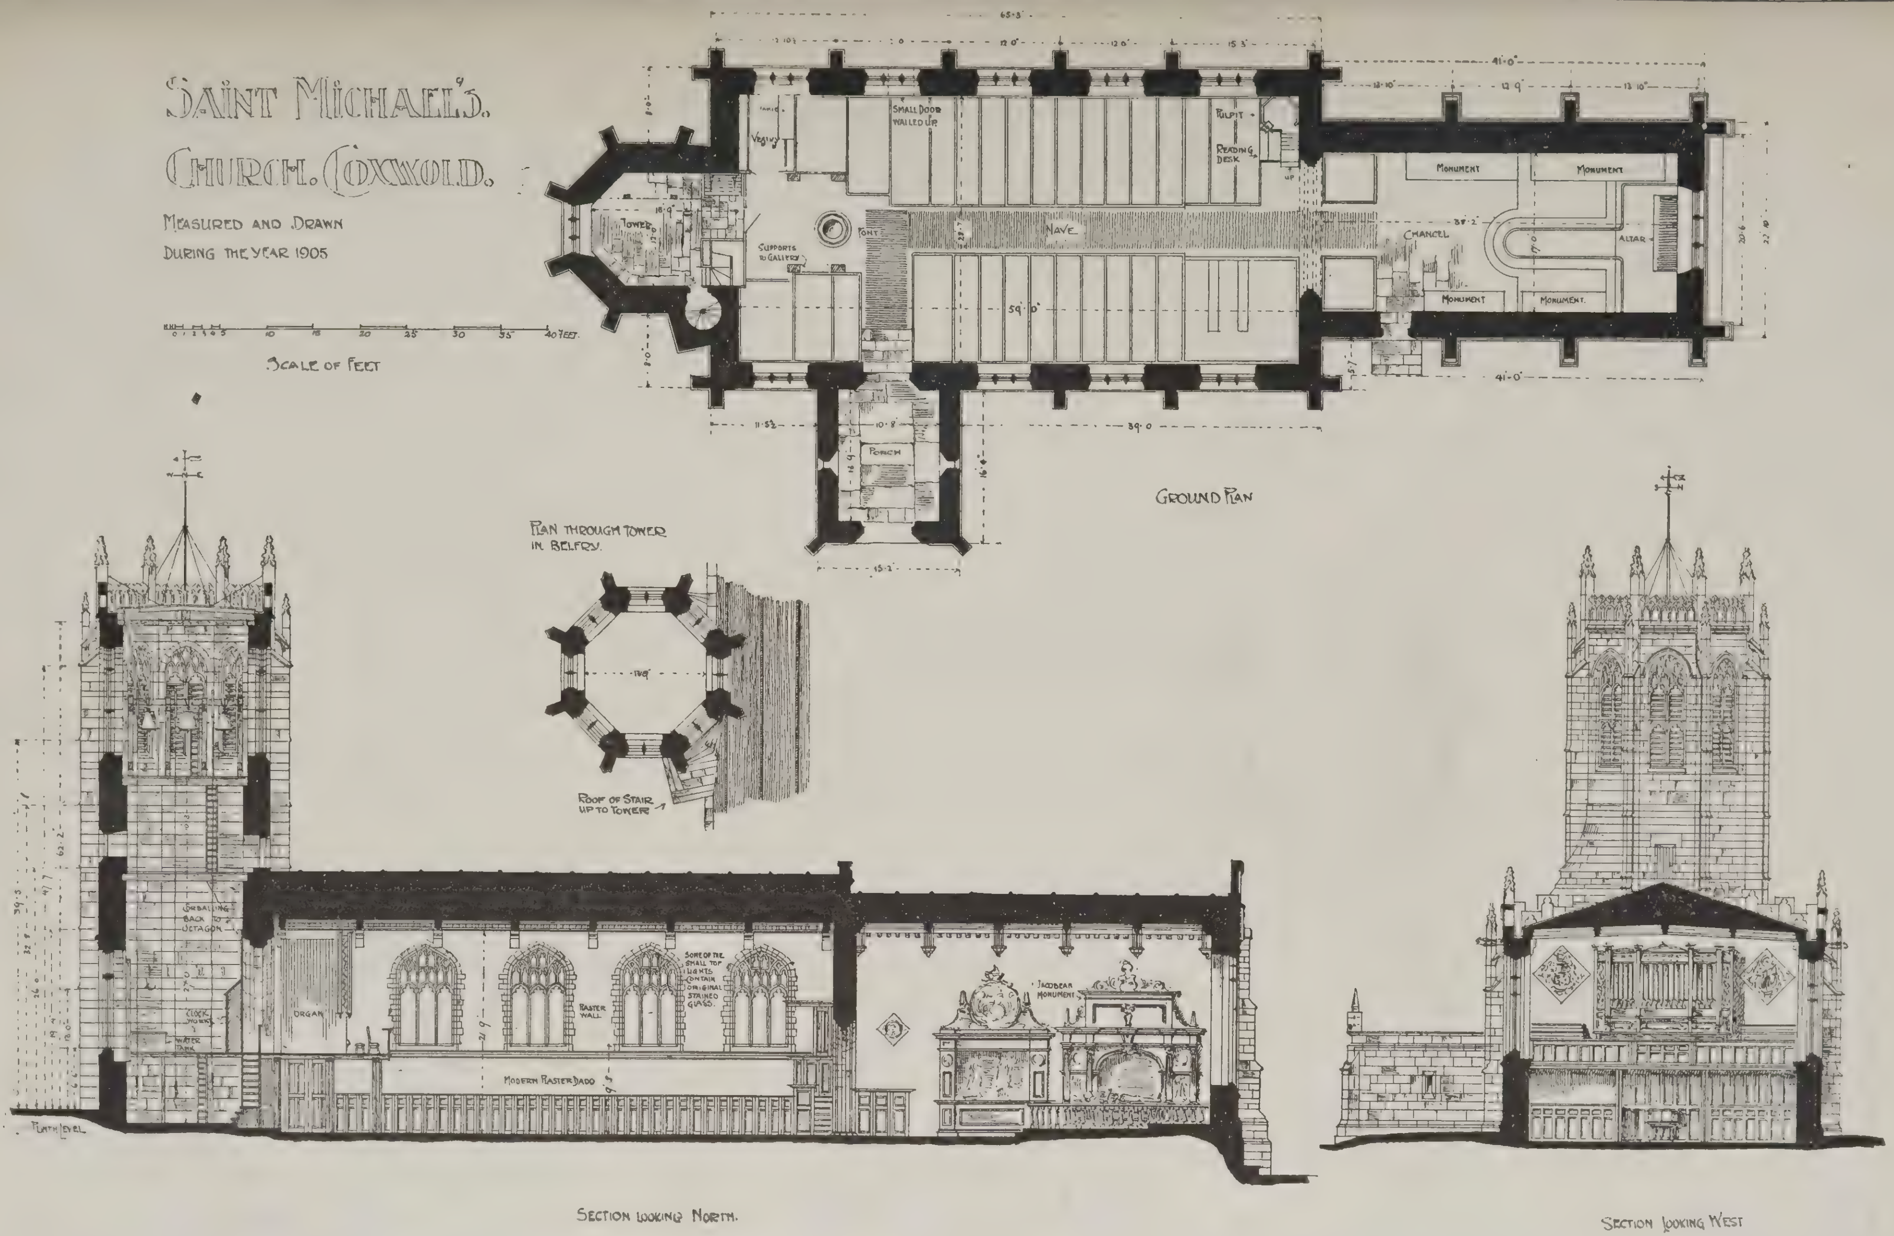
Living Down Criticism.

The opening-up of the site, the excavation for foundations, and the construction of a considerable bulk of the dam were carried out by the Public Works engineers, until June last year, when a contract was let to Messrs. Lane and Peters for the completion of the work—the Department supplying the cement, which is manufactured by the Commonwealth Co. The work has progressed steadily day and night since, and will be finished in May, 1907. A great controversy arose in connection with this work, and charges of all sorts were levelled at the engineers constructing it. (Mr. L. A. B. Wade, M.I.C.E., is the chief engineer.) Two Royal Commissions enquired into it, and the name of the Cataract Dam was a byword in the city at one time. The man in the street spoke of it with derision, but the work went on just the same, and there it is, one of the great dams of the world, and also one of the most scientifically and economically-constructed dams ever built.

The following are some comparative figures of great dams in different parts of the world:—

	Height	Reservoir Area	Storage capacity
	ft.	Acres	Millions of gallons
Sydney, Cataract... ...	154	2,145	21,411
Birmingham, Elan Valley (6 dams)	128	1,499	18,000
Liverpool, Lake Vyrnwy	85	1,115	12,000
Manchester, Thirlmere...	52	793	8,130
Bombay, Tausa	118	3,520	16,074
Coolgardie. W.A., Mundaring	100	800	4,600
Croton, New York ...	163	3,360	30,000

The height of dams given above is from the bed of river, not from foundation, which is in many cases a considerable depth below river bed.



The church is in the Perpendicular style and stands on an eminence at the top of a sloping village street. It comprises a chancel, nave, south porch and a fine octagonal west tower. This tower is quite unique amongst the small village churches of Yorkshire and is a very pleasing feature. The chancel was rebuilt in 1777 and the east window was inserted in 1889. All the windows in the nave appear to have been inserted at a later date than the original building, but they contain a large amount of ancient stained glass. The sides of the chancel are occupied by monuments of the Belasyse family, and Barons, Viscounts and Earls of Fauconberg. The most ancient is the Jacobean altar tomb of Sir William Belasyse (dated 1603), constructed of stone, wood and lead. There are two others in white marble which date back to 1652 and 1700. Laurence Sterne, the famous author of "Trirtam Shandy," &c., was vicar of this church from 1760 until his death in 1768. The measured drawings here reproduced are by Mr. William Whitehead, of Leeds.

TWO SOUTH AFRICAN BUILDINGS.

In the issue of the "South African Master-Builders' Federation Journal" for August, which has just reached us from the Cape, reports are given of two important South African buildings now in course of erection. These are the new University buildings at Cape Town, and the new Town Hall at Durban, both of which, it will be remembered, were the subjects of open competition. The architects of the

Cape University Buildings

are Messrs. W. Hawke, F.R.I.B.A., and W. M. M'Kinlay, whose selected design was given in our issue for May 27th, 1903. It appears that the scheme is not at present to be carried out in its entirety, which is to be regretted. The contractors are Messrs. F. B. Smith & Sons, whose tender was selected out of 23 sent in. Latterly the building has not made much progress, but it is expected that the portion first to be completed will be ready about the end of this year. The building occupies a valuable site fronting Queen Victoria Street, and when completed will have as its central feature a great hall (half a circle on plan) with an internal diameter of 105ft. and a height of 56ft. After extensive enquiry, it was decided that South African stone should be used for the exterior. The base, therefore, is of Paarl granite and the superstructure of Flatpan stone from the Orange River Colony. The roofs are to be covered with Spanish tiles and the dome with copper.

The New Town Hall at Durban

is not far above ground level yet. The building is to have a steel frame and the steelwork will be carried out by a local firm, Messrs. Charles Wade & Sons. For the past month the stonework has been at a standstill, owing to insufficient supply, but by this time it will have been begun again. There is, too, a shortage of labour, which delays the construction.

Obituary.

Lieut.-Col. J. Gale, F.R.I.B.A., died recently. He was one of the oldest members of the Institute, and designed some of the first of the London Board Schools; also St. Luke's Church and Schools, Bermondsey, and many warehouses, factories, &c. At one time he was in partnership with Mr. J. Alfred Gotch and Mr. A. J. Leighton.

Mr. James K. Bolton, architect, of Gravelly Hill, died recently as the result of injuries received at New Street Station, Birmingham. He was alighting from a moving train when he slipped and fell between the platform and the footboard. He was terribly injured, and died on the way to the hospital.

A new Village Library has just been completed at Llantwit-Vardre, Pontypridd, from designs by Mr. Arthur L. Thomas, architect, of Pontypridd. The builders were Messrs. Price Brothers, of Cardiff. The cost of the library was £1,700.

A new Harbour at Southwold is to be constructed. The total cost will be £45,000, towards which the Treasury has made a grant of £15,000. The existing piers, which practically form the harbour, are to be extended 340ft., and there is to be a uniform depth of water of 40ft. on the north side of the harbour. There will be a concrete quay 1,000ft. long, and behind this the pickling plots.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Sept. 6. Treforest.—*Additions to Castle Square English Congregational Church, Treforest,* for the Trustees. Plans and specification may be seen at the office of LL. Thomas, A.M.I.M.E., architect and engineer, Church Street Chambers, Pontypridd, to whom tenders are to be sent on or before Sept. 6.

Sept. 7. Buckingham.—*Repair of a Foot-Bridge* between Addington and Verney Junction, for R.D.C. Tender forms, with copy specification, can be obtained on application to Thomas R. Hearn, clerk, 26 West Street, Buckingham, to whom tenders must be sent not later than Friday, Sept. 7.

Sept. 7. Stockport.—*Erection of stables and coach-house, &c.,* at the Stepping Hill Hospital, Hazel Grove, near Stockport, in accordance with plans and specification, &c., prepared by W. H. Ward, architect, Paradise Street, Birmingham. Plans and specification may be seen of C. F. Johnson, clerk to the Guardians, Union Offices, Stockport, or upon application to Mr. Ward during the usual office hours. Forms of tender, with copies of bills of quantities, will be sent to contractors upon application to C. F. Johnson, enclosing cheque for £2 2s. Sealed tenders are to be sent to C. F. Johnson not later than 10 a.m. on Sept. 7. Fair wages clause

Sept. 8. Gressenhall.—*Seven new windows and work in connection therewith* at Gressenhall Workhouse, for the Mitford and Launditch Union, in accordance with specifications, which may be inspected at any reasonable time at the Workhouse. Tenders, marked "Windows," should be sent to W. M. Barton, clerk to the Guardians, the Guildhall, East Dereham, on or before Sept. 8.

Sept. 8. Reigate.—*Erection of cart sheds and a store at the Corporation depôts in Brighton Road, Redhill, London Road, and Blackborough Road, Reigate,* all in the Borough of Reigate, in accordance with plans, sections, general conditions, and specification prepared by F. T. Clayton, C.F., the borough surveyor, which may be seen, and full particulars obtained, at his office at the Municipal Buildings, Reigate. The contractor whose tender may be accepted will be required to enter into a contract in writing, the form whereof may be seen of the Town Clerk, and himself and his surety or sureties will be required to enter into a bond for the due fulfilment of the contract. Sealed tenders, on forms which will be provided on application, giving the names and addresses of two sureties, are to be delivered to A. Smith, Town Clerk's office, Municipal Buildings, Reigate, endorsed "Tender for Cart Sheds," not later than noon of Sept. 8.

Sept. 8. Kea.—*Erection of a stable at Calenick Farm,* in the parish of Kea, in the occupation of the executors of T. Thomas. Plans, conditions, and specifications can be seen at the farm house at Calenick. Tenders should be sent on or before Sept. 8 to G. Gow, Tregothnan Office, Truro.

Sept. 8. Derby.—*Erection of a new school* on a site between Clarence and Porter Roads. Plans, specfications, and conditions of contract may be seen and schedules of quantities may be obtained, on application to Hunter and Woodhouse, All Saints' Chambers, Iron Gate, Derby. The sum of £1 1s. will be charged for the schedule of quantities. Tenders on the form supplied, together with the priced schedule of quantities, must be delivered at the Education Office, Becket Street, Derby, before 12 o'clock at noon on Sept 8, endorsed "Tender for New School on Clarence Road." Fair wages clauses. Tenders will be accepted from Derby firms only.

Sept. 8. Glamorgan.—*1. New Police Station at Glyn-Neath. 2. Alterations and additions at the Bridgend Police Court buildings* for the Standing Joint Committee of the Glamorgan Quarter Sessions and C.C. Plans and specifications of the respective works may be seen and copies of the bills of quantities obtained at the following places:—Work No. 1, at the county police station, Neath; work No. 2, at the county police station, Bridgend; and for each of the works at at these offices. Fair wages clause. Sealed tenders are to be delivered to T. M. Franklen, clerk of the County Council, Glamorgan C.C. offices, Westgate Street, Cardiff, together with the full names and addresses of two substantial sureties, not later than Sept. 8, marked outside "Tender for Glyn-Neath Police Station," or "Tender for Alterations to Bridgend Police Court Buildings," as the case may be.

Sept. 10. Seldown, Poole.—*Erection of a secondary school* at Seldown, Poole. Plans and specifications may be seen at the office of W. Andrew, architect, Parkstone. Tenders are to be delivered at the office of C. Lisby, secretary, Fish Street, Poole, not later than noon, Sept. 10.

Sept. 10. Alnwick.—*Erection of branch premises at Alnwick* for the Amble Co-operative Society, Ltd. Quantities can be obtained upon application to E. G. Ekins, architect, Co-operative Wholesale Society, West Blandford Street, Newcastle-on-Tyne. Tenders, endorsed "Alnwick New Building," will be received at the society office, Queen Street, Amble, up to 12 o'clock noon, Sept. 10.

Sept. 10. Dublin.—*Workmen's dwellings in Townsend Street,* in accordance with the plans, specification, and conditions of contract prepared by the City Architect, which may be inspected daily (except on Saturdays) at the Municipal Building, Cork Hill, Dublin, between the hours of 11 a.m. and 4 p.m. No tender will be entertained which is not on the prescribed form. Copies of bills of quantities and forms of tender may be obtained from the City Treasurer, Municipal Buildings, Cork Hill, Dublin, on payment of £2. Tenders must be accompanied by the priced bills of quantities (priced in ink), and must also contain the names of two solvent sureties willing to be bound severally with the contractor for the due performance of the contract in a sum of one-fifth of the amount of the contract price. Tenders under seal addressed to the "Chairman, Improvements Committee," and endorsed "Tenders for the erection of Dwellings in Townsend Street," to be lodged at the Improvement Committee Office, City Hall, Dublin, not later than 4 o'clock on Sept. 10. Contractors will be required to agree to the condition that no tender shall be amended or withdrawn before the expiration of a period of two months from the date of delivery to the Corporation. The work to be executed under this contract shall be done entirely by local labour, and where this is considered impracticable the contractor is to apply to the Municipal Council for permission to have the work done by other than local labour, and the Council having considered the statements submitted by the contractor shall by resolution determine whether the work is to be done by local labour or otherwise. The contractor shall be bound by such resolution. Fair wages clause.

Sept. 10. Bury St. Edmund's.—*Alterations and additions to the County School,* Northgate Street, Bury St. Edmund's, for the West Suffolk Education Committee. Plans and specifications can be seen at the Education Offices, 5, Crown Street, Bury St. Edmund's, or at the offices of the County Architect, A. Ainsworth Hunt, Sudbury and Bury St. Edmund's. Tenders, sealed and endorsed, to be delivered to F. R. Hughes, secretary to the Education Committee, 5, Crown Street, Bury St. Edmund's, on or before Sept. 10.

Sept. 10. Salford.—*Extensions to car depot and workshops* for the Tramways Committee. Contract 145, constructional steelwork; contract 146, builders' work, in their erection and completion of extensions to the Central Car Depot, Frederick Road, Pendleton. Forms of tender and bills of quantities for either contract may be obtained on application to the General Manager, Tramways Department, 32, Blackfriars Street, Salford, upon depositing a cheque for £2 2s. Plans can be inspected and further particulars obtained at the above-mentioned offices. Tenders endorsed "Steelwork" (or "Buiders' Work" as the case may be) "Car Depot Extensions," and addressed to the Chairman, Tramways Committee, Town Hall, Salford, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 3 p.m. on Sept. 10.

Sept. 11. Manchester.—*Execution of alterations at the Benton Technical Institute* for the Lancs. Education Committee. The plans may be seen and bills of quantities obtained at the offices of J. W. Beaumont & Son, 10, St. James's Square, Manchester. Tenders must be delivered before 12 o'clock noon on Sept. 11, sealed and endorsed, to W. F. Knott. Parish Offices, Ashton-under-Lyne.

Sept. 11. Audenshaw.—*Erection of a new public elementary school* at Audenshaw. The plans may be seen and bills of quantities obtained at the office of Henry Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on Sept. 11, sealed and endorsed, to W. F. Knott, Parish Offices, Ashton-under-Lyne.

Sept. 11. Crewe.—*Making of the back passages leading from Walthall Street to Westminster Street, and behind Lewis Street,* within the borough, in accordance with plans, sections and specifications, which may be seen and all other necessary information obtained upon application to G. E. Shore, borough surveyor, Earle Street, Crewe. The contractor must provide the whole of the materials required in the making of the above passages. A deposit of £1 will be required. Sealed tenders and schedule of prices, upon printed forms to be obtained from the Borough Surveyor, must be delivered to F. Cooke, town clerk, Municipal Offices, Crewe, not later than nine o'clock in the forenoon of September 11, endorsed "Tender for Back Passage Making." No tender will be accepted unless made out on the printed form above named, with all the items in the schedule of prices fully priced.

Sept. 11. Gravesend.—*Erection of a registrar's room* at Gravesend Hospital. Plan and specification may be seen on application to the secretary at the hospital. Tenders must be sent in not later than 4 p.m. on Tuesday, Sept. 11.

Sept. 11. London, N.—*1, General exterior repairs, cleaning, painting, &c.; 2* (a), *Repairs to roof of laundry building, and, alternately* (b) *construction of new roof altogether,* for the Guardians of the Poor of the Strand Union at their workhouse at Upper Edmonton, near Silver Street Station (G.E.R.). Plans and specifications may be inspected at the offices of the Architect to the Guardians, A. A. Kekwick, 18 and 19, The Outer Temple, Strand, between the hours of 11 and 4 o'clock (Saturday excepted), or at the workhouse at Edmonton. Separate tenders, sealed and endorsed, "General Repairs, Edmonton," "Repairs to Laundry Roof," or "New Roof to Laundry," as the case may be, are to be delivered at 15, Henrietta Street, Covent Garden, W.C., by 4 p.m. on Sept. 11.

Sept. 12. York.—*Erection of a new club house,* for the York Golf Club. Drawings and specifications may be inspected at the offices of Mr. J. Edmund Jones, solicitor, 1, Market Street, York, between the hours of 10 a.m. and 5 p.m. Tenders (on the form supplied) are to be addressed and delivered to the Chairman, York Golf Club Committee, 1, Market Street, York, on or before Wednesday, Sept. 12, sealed and endorsed "Tender for New Golf Club House."

Sept. 12. Merthyr Tydfil.—*Additions and improvements* to Bethesda Congregational Chapel, Merthyr Tydfil. The plans and specifications can be seen with Mr. Rees Jones, grocer, Bethesda Street. The tenders to be sent, sealed and endorsed, to J. Thomas, 90, Brecon Road, Merthyr Tydfil, not later than Sept. 12.

Sept. 13. Chartham Hatch.—*Alteration and enlargement, to accommodate 40 additional children of the Council School at Chartham Hatch,* near Canterbury, Kent. Drawings and specifications may be inspected at the office of W. J. Jennings, architect, 4, St. Margaret's Street, Canterbury. Any person desiring to tender and to receive copy of bills of quantities must send his name to the architect, together with a deposit of £1, not later than noon on September 4. Tenders on the form supplied to be delivered to F. S. Cloke, Sandwich, Kent, not later than noon on September 13.

Sept. 13. Hatton.—*Supply of building materials* for the ensuing twelve months, from Oct. 1, 1906, to Sept. 30, 1907, at the Warwick County Lunatic Asylum, at Hatton, near Warwick, where forms of tender may be obtained, and samples of materials seen, after Sept. 6. Tenders to be sent in by Sept. 13.

Sept. 14. Cambridge.—*Alterations and Additions* to "The Green Man" Inn, Six Mile Bottom, near Cambridge, for General Municipal Charities Trustees of the City of Coventry. Particulars and quantities may be obtained on application to Herbert W. Chattaway, Surveyor to the Trustees, Trinity Churchyard, Coventry, to whom tenders must be delivered not later than 10 o'clock Friday, Sept. 14.

Sept 14. Low Bradfield.—*Additions, &c., to Low Bradfield Provided School, near Sheffield,* for the West Riding Education Committee. Plans may be seen and quantities obtained on application to J. Vickers-Edwards, county architect, County Hall, Wakefield. Sealed tenders, properly endorsed, to be sent to him not later than 10.30 on the morning of Sept. 14.

Sept. 14. Harthill-with-Woodall, West Riding.—*Erection of a new cloakroom at Harthill-with-Woodall* Provided School for the West Riding County Council. Plans may be seen and quantities obtained on application to J. Vickers Edwards, county architect, County Hall, Wakefield. A deposit of £1 is required, which will be returned on receipt of a *bona fide* tender. Cheques to be sent to the West Riding Treasurer, County Hall, Wakefield. Sealed tenders, properly endorsed, to be sent to the County Architect, not later than 10.30 on the morning of Sept. 14.

Sept. 14. Wakefield, West Riding.—*Different works in connection with the following schools:*—Thornton-in-Craven new School, Elslack new School, Cudworth new School, Kirkhamgate new School, Bolton-on-Dearne (Goldthorpe, Infants), Provided School (enlargement), Mytholmroyd (Scout Road Provided School, sanitary alterations), Mytholmroyd (Burnley Road Provided School, sanitary alterations), Mytholmroyd (Cragg Vale Provided School, sanitary alterations—builder and plumber), Harthill-with-Woodhall Provided School (alterations and new cloakroom—builder, &c.), Adwick-on-Dearne Provided School (alterations and repairs—builder and asphalter), for the West Riding C.C. Education Committee. Plans may be seen and quantities obtained on application to J. Vickers Edwards, county architect, County Hall, Wakefield. Sept. 17. London, W.—*Re-drainage and sanitary work at the Nurses' Home, St. Marylebone Infirmary*, Rackham Street, Notting Hill, W. Persons desiring to tender may inspect the specification and drawing, and obtain bills of quantities and form of tender, between the hours of 10 a.m. and 4 p.m. (Saturday 10 a.m. to 1 p.m.), upon application to the Guardians' architect, A. Saxon Snell, F.R.I.B.A., of 22, Southampton Buildings, Chancery Lane, W.C., and depositing with him a £10 Bank of England note. Tenders to be signed, sealed, and endorsed "Tender for Re-drainage and Sanitary Work at the Nurses' Home," and addressed and delivered to H. T. Dudman, clerk to the Guardians, Guardians' Offices, Northumberland Street, Marylebone Road, W., at or before 10.30 a.m. on Sept. 17.

TOO LATE FOR CLASSIFICATION.

Sept. 7. Scarborough.—*Painting* at the cemetery. Specification may be seen at the board-room, Cemetery Lodge, between the hours of 10 a.m. and 4 p.m. (Saturday excepted). Tenders should be sent in to the superintendent, endorsed "Painting," not later than Friday, Sept. 7.

Sept. 8. Shipley.—*Alterations and additions* to the Salt Schools, Shipley. Names to be sent to Sam Bradley, architect, Yorkshire Bank Chambers, Shipley, not later than Sept. 8.

Sept. 10. Rhymney.—*Alterations and building additions* to "Tymawr," Rhymney. Plans and specification can be seen at "Tymawr," or at the office of T. Roderick, architect, Ashbrook House, Aberdare, where bills of quantities can be obtained on application. Endorsed tenders to be sent in to T. Edwards, Esq., "Tymawr," Rhymney, not later than Sept. 10.

Sept. 11. Llantrisant. — *Erection of four bungalows* at Coed-Ely, near Llantrisant, for the Welsh Navigation Steam Coal Co. Plans and specifications may be seen at the office of P. J. Jones, architect, Cilfynydd, Pontypridd, to whom tenders are to be sent on or before Sept. 11.

Sept. 13. Choppington.—*Flagging* the bottom and slopes of a setting pond at Choppington Colliery (area of concrete flagging about 1,070 sq. yds.), for the Cowpen U.D.C. Plans and specification may be seen and forms of tender obtained at the offices of Robert Grieves, surveyor to the Council, Seaforth Street, Blyth, to whom sealed tenders, endorsed "Tender for Flagging," must be delivered not later than 4 p.m. on Thursday, Sept. 13.

Sept. 13. Tylorstown.—*Erection of Pastors' villa.* Plans and specifications can be seen with Mr, J. E. Jones, Hendrefadog Shop, Tylorstown. Tenders to be sent, sealed and endorsed, to Mr. Thomas Hill, 13, Church Terrace, Tylorstown, not later than Sept. 13.

Sept. 15. Bargoed.—*Erection of a vestry* for the Welsh Baptist denomination. Tenders to be sent in to Mr. Mark Old, 20, Henry Street, Bargoed, on or before Sept. 15. Plans and specifications may be seen with the above or with P. Vivian Jones, P.A.S.I., architect and surveyor, Hengoed.

Sept. 18. Spennymoor.—*Supplying and laying new concrete flags and kerbing* for a portion of High Street, Spennymoor, for the U.D.C. Plans and specifications may be seen, and forms of tender obtained, on application to Mr. C. R. Spencer, surveyor to the Council, Silver Street. Spennymoor. Tenders, marked "High Street Footpath," to be sent to F. Badcock, clerk, Council Offices, Spennymoor, not later than Tuesday, Sept. 18.

No date. Keighley.—*Erection of a spinning mill*, shed, engine and boiler houses, chimney, &c., South Street, Keighley. Drawings may be seen and quantities obtained with J. B. Bailey & Son, architects, 3 Scott Street, Keighley, on Sept. 7.

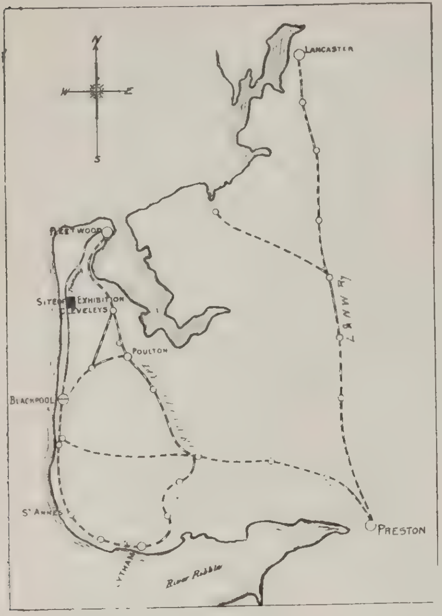
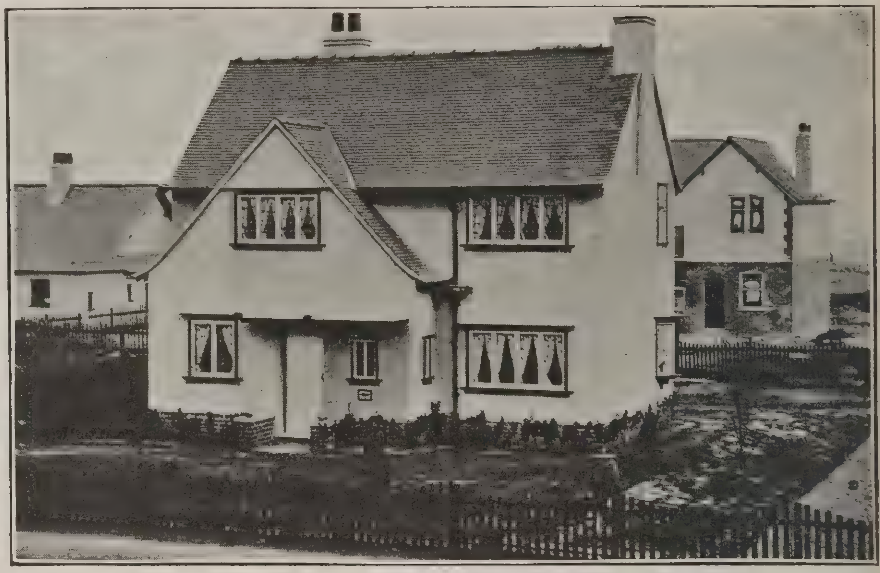
Bad Acoustics. ARCHITECTS have been constantly assailed about the bad acoustics of certain buildings, such as law courts and council chambers, and it appears that some dissatisfaction is being expressed with reference to Croydon's new county court, and also with the council chamber of the new City Hall at Belfast. The former appears to have a distressing echo, while, as regards the latter, it is not plain whether there is an echo or only reverberation. Exact knowledge of architectural acoustics is quite recent. A few years ago it would have been impossible to guarantee that a building should be satisfactory so far as its hearing capacity was concerned, unless it were copied in every dimension, detail and material from an existing hall which had been found satisfactory. The authors of existing books on the subject have been all at sea in the matter, and it was not until Professor Sabine, of America, made his researches (which we have several times referred to in our columns) that information was available which would assure success. It is not so much a question of the shape or proportions of a hall, although an echo will be much worse with some shapes than others, and, of course, a building may be too large for the voice to be heard perfectly from all parts of it. The acoustic properties depend more upon the cubical contents and the absorptive power of the materials which form the surfaces of the compartment. It is now possible to calculate the exact amount of sound which it is necessary to absorb and the amount of materials which will do this. It is a point of difficulty, however, with buildings belonging to the class above referred to that the number of persons occupying them varies so considerably. It may have been noticed that a very marked echo often can be obtained in a hall which is empty or nearly so, whereas none exists when the hall is full of persons.

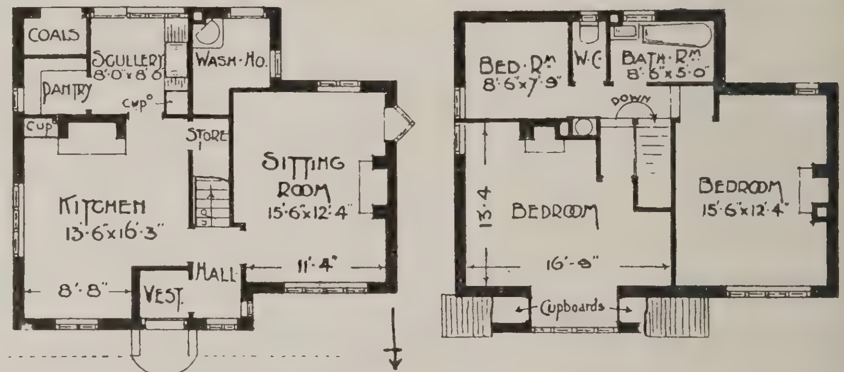
The Design of Capitals. IT is rather a peculiar fact that so little freshness should be imbued into the design of capitals. The classic examples seem to be regarded as the only possible and proper models to follow. While it is true that in Grecian work especially these are most exquisite—the Ionic being particularly refined—there is plenty of scope for architects of to-day to design capitals which would strike a new note. Efforts of the kind have of course been made, but they are not very numerous, and when made by designers who are crankish in all their works it is hardly likely that the results would be pleasing. Nevertheless, we feel there is scope for refined modern design in capitals. Architects might very well devote more attention to the matter. Nash had a fancy for it, and the capitals he produced were most interesting.

A Circulating Technical Library. IN the *Electrical Review* we notice a suggestion which, though put forward in the specific interests of the electrical industry, is equally applicable to architecture and the building trades. The suggestion is that there should be a circulating library of technical books. A "Resident Engineer" urges that such a library would be a great boon to students—more especially students in the provinces—who would thus be enabled to obtain many new and important works otherwise beyond their reach. The ideal arrangement would seem to be a sort of miniature Mudie. "I feel sure," says the correspondent, "that many of the supply companies and corporations as well as the larger firms of manufacturers and contractors, would act as local agents. They would receive boxes of books, say, once a month, and those of their employees who wished to avail themselves of the volumes would pay a share of the annual subscription." Commenting on the suggestion, our contemporary says that a similar idea was put forward about a year ago in Manchester, and some attempt was made to carry it into practice, but the fact that nothing has been heard of the project of late suggests that it was found to be impracticable, or that adequate support was not forthcoming. The suggestion is nevertheless an interesting one. It would be quite outside the scope of any disinterested individual to attempt to establish such a library, say, for the architectural profession and the building world, but it might perhaps be done by a society. At present, of course, publishers send copies of new works to the societies, or at least the societies get them as free gifts from members. While in London, however, the societies' libraries may be up-to-date, we do not suppose that this is the case throughout the country. But there is one point in connection with architectural works which should be pointed out, namely, the size of some of the books. These are often very large and unwieldly, and it would be awkward to send them about the country continually: but a great many new books not now easily accessible to students and others could very well be forwarded from place to place, and it is in respect of these especially that some sort of circulating library would be a service. While referring to this matter it is opportune to note that Sir William H. Bailey in his inaugural address to the Library Association at Bradford last week spoke of the Forney libraries of industrial art which are established in the working-class districts of Paris. They are under municipal control, and when all are erected there will be one in each of the 100 wards of the city. The special object is to provide books of interest to the particular trade of every district. Sir William Bailey instanced a library of cabinet-making which he visited. "I there saw," he says, "models and drawings of thousands of articles of utility and beauty made of wood, and the librarian assured me that anything that could be found in the pages of books on woodwork might be found on the shelves." Plasterers, house decorators, designers of iron and bronze gates, builders and other workers in the constructive and decorative arts are similarly catered for.





CLASS I. FIRST PRIZE: ALBERT E. DONE, ARCHITECT. (Cost £290.)



CLEVELEYS COTTAGE EXHIBITION.

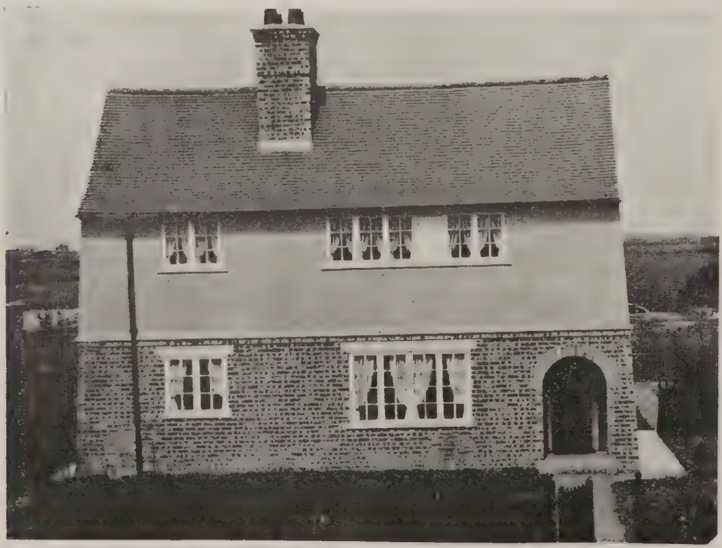
In our issue for last week we were able to publish the judges' report and awards in the Cottage Competitions held in connection with the exhibition of small houses at Cleveleys. We are now able to give some illustrations of the prize cottages, together with some particulars of the exhibition.

Cleveleys, it may first be stated, is situated on the Lancashire coast, four miles from Blackpool; its position is clearly shown by the small map above. It is easily accessible by tramway both from Blackpool and Fleetwood. The soil is a light marl, well drained; a good water-supply has been laid on, an efficient drainage scheme completed (sewers being connected to all houses), while, for lighting, there will shortly be gas—and probably electric light—available.

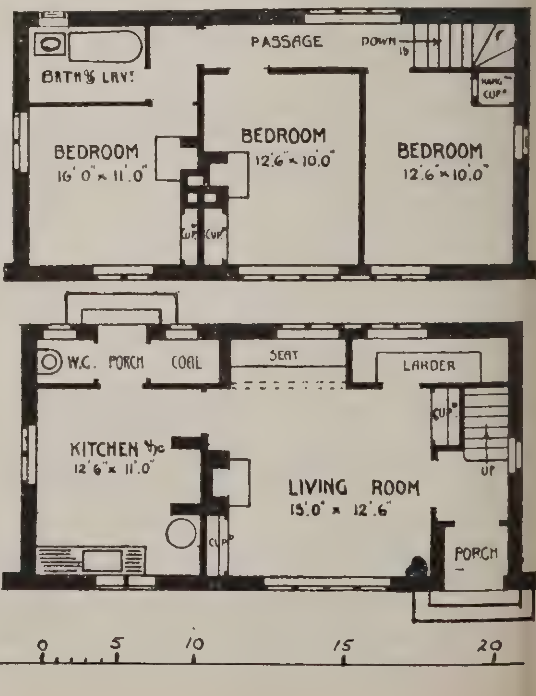
The exhibition was opened towards the end of July and closes on September 29th. It has been directed by the Fleetwood Estate, Ltd., the owners of the site, and may be considered as complementary and supplemental to the exhibition at Letchworth (Garden City); for, at Cleveleys, the main object has been to show how cheaply, yet substantially, a good cottage or small house may be erected under existing by-laws of average severity (those of the Thornton Urban District Council), no precise cost being stipulated, but the prizes awarded for "the best value for money"; whereas, at Letchworth, the £150 cottage dominated the scheme, and the exhibition was specially intended to show what might be built if only the vexatious rural by-laws were relaxed.

The cottage exhibits at Cleveleys are of four classes, and the awards have been made on the basis of external appearance, economy of planning, convenience, cost per ft. cube, and least expenditure for maintenance and repairs; exhibitors being required, prior to the opening of the exhibition, to declare the price (including builder's profit) at which, under similar conditions, they would be prepared to duplicate their exhibits.

The judges, as stated in our issue for last week, were Mr. John H. Woodhouse, F.R.I.B.A., president of the Manchester Society of Architects; Mr. Charles H. Barnsley, Birmingham, past-president of the Institute of Builders; and Mr. Henry R. Aldridge, secretary of the National Housing Reform Council; these three having been appointed respectively by the Royal Institute of British Architects, the Institute of Builders, and the National Housing Reform Council.



CLASS I. SECOND PRIZE: BERTRAM DRUMMOND, A.R.I.B.A., ARCHITECT. (Cost £275.)



The four classes of cottage exhibits were:—

Class I. Detached Cottage, with not fewer than three bedrooms.

Class II. Pair of cottages, with not fewer than three bedrooms in each.

Class III. Design and specification for detached cottage to cost not more than £180.

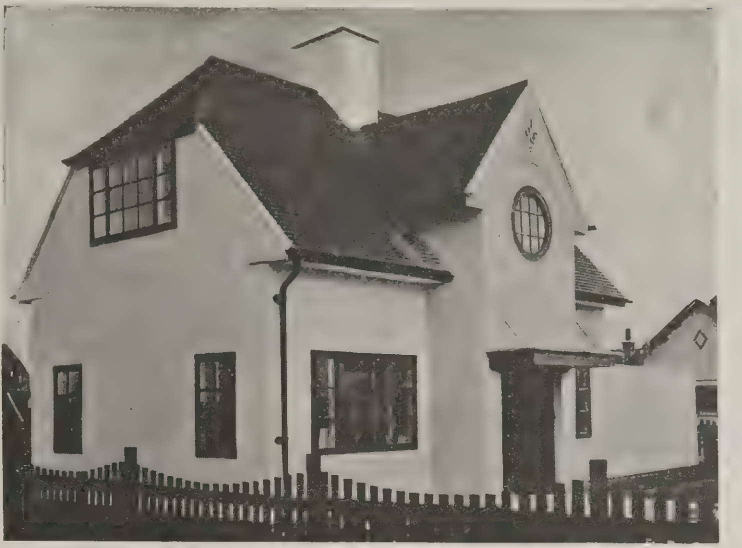
Class IV. Design and specification for pair of cottages to cost not more than £350.

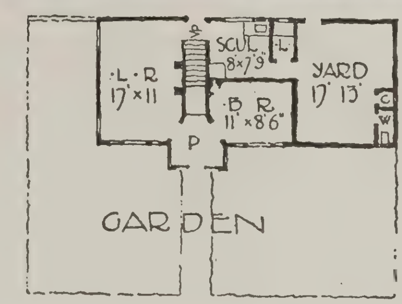
In addition, there was Class V. for the best laid-out garden, those competitors in Classes I. and II. who did not wish to compete in this class being required to allow their plots to be laid out as gardens.

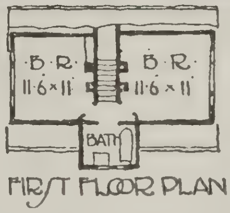
Diplomas were also awarded for the best exhibits in connection with the building and furnishing of cottages in Classes I. and II.

Two large pavilions have been erected on the estate in which the designs for cottages, and the trade exhibits of materials, furniture, &c. are shown.

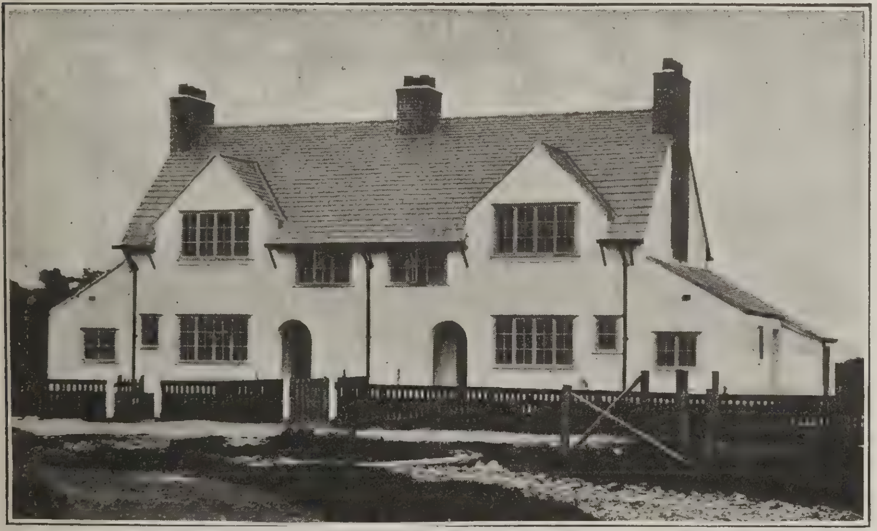
In Class I. the first prize (£100) has been awarded to cottage No. 27. The successful architect is Mr. Albert E. Done, of 2, Oxford Road, Blackpool. There is no need to describe the accommodation, as this is shown by the plans here reproduced. The house cubes 16,725ft. which at 4½d. gives a total cost of £290 (this including the cost of the house as built, with sewers, fencing, copper back boiler and cylinder, and £10 for grates, but not for forming garden and paths, nor wall decorations). The cost of the house if duplicated is put at £285 (including builder's profit and architect's fees, but exclusive of site, fencing, sewers, paths, and ornamental rainwater head). There is concrete under all walls and over the site. Walls are of brick 11ins. thick, with a cavity, and rough cast on the exterior with Portland cement, dashed with amber spar—not to be colour washed; roofs are of hand-made red tiles (supplied by the Silverdale Tiles Co., Staffs.).

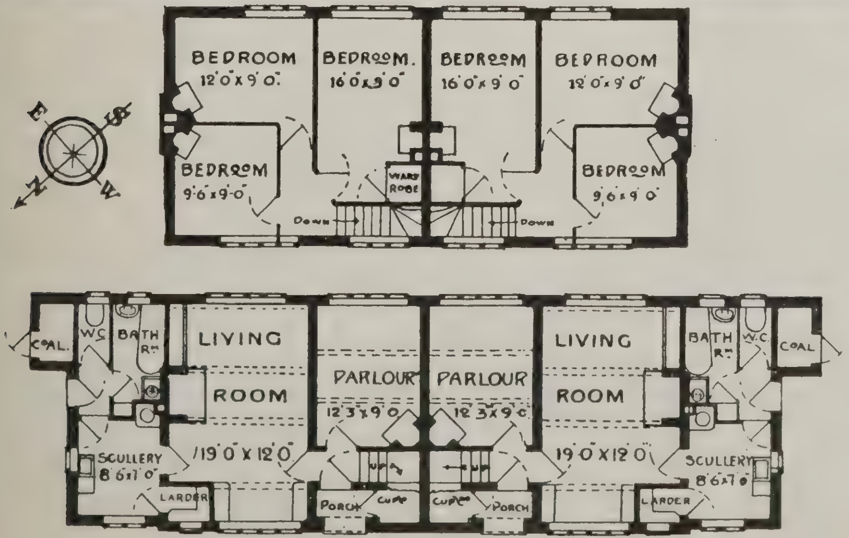






CLASS I. THIRD PRIZE: PATRICK ABERCROMBIE, ARCHITECT. (Cost £228.)

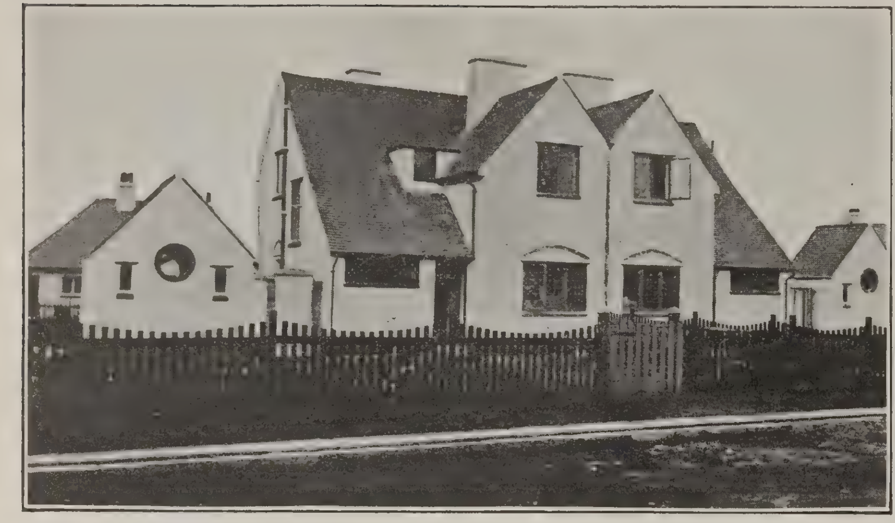


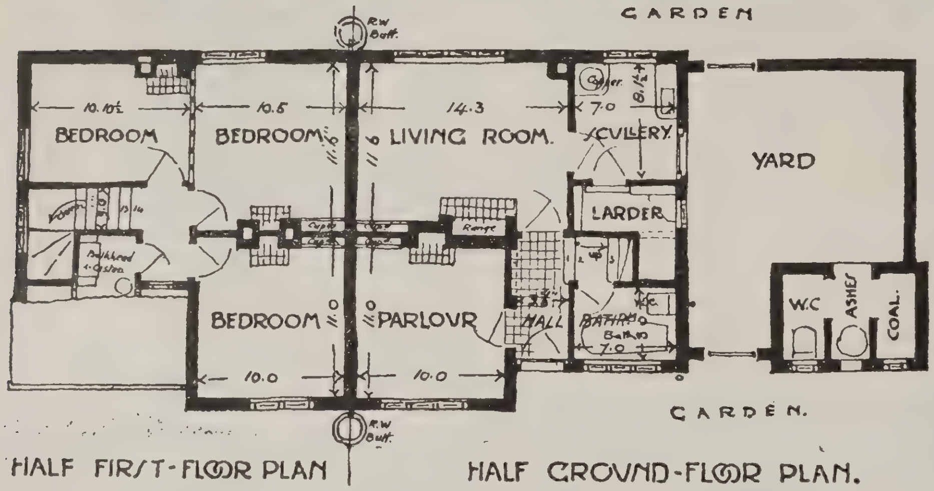


CLASS II. FIRST PRIZE: Q. MANGNALL BLUHM, ARCHITECT. (Cost £430 the pair.)

The second prize (£50) in Class I. is awarded to cottage No. 14, the architect of which is Mr. Bertram Drummond, A.R.I.B.A., of 6, Birley Street, Blackpool, and 16, Clifford's Inn, London, E.C. The builders were Messrs. J. Preston & Sons, of Adelaide Street, Fleetwood. The cost of this cottage is given as £275 (cubing 13,904ft. at 4¾d). If duplicated, the cost is put at £325 (including builder's profit and architect's fees, but exclusive of site, fencing, sewers and street making); it is stated that "this price could be considerably reduced on a modified specification." In the kitchen scullery there is a fireclay enamelled sink with a wooden drainer, and a cupboard under; also a portable copper. The cottage has a concrete foundation, with a layer of asphalt under all walls, these latter (external) being 11ins. thick, with a cavity, built of good common bricks, and the upper part rough-cast; roofs tiled. Special care has been taken with the construction, all external wood lintels being covered with sheet lead, and the chimney surrounded with 9-in. brickwork. There are no outbuildings, everything being under one roof.

The third prize (£25) in Class I. has been awarded to cottage No. 22. The architect is Mr. Patrick Abercrombie, of Chester, and the builder Mr. Edward Saville, of South Shore, Blackpool. The cost of the cottage as built is given as





CLASS II. SECOND PRIZE: T. FAULKNER SHEPHEARD, ARCHITECT. (Cost £222 each Cottage).

£228 (11,547 cub. ft. at 4¾d. per cub. ft.), and the cost, if duplicated, £229 (exclusive of fencing, drainage and garden). Coals and W.C. are provided in a corner of the yard. Walls are of brick, 11ins. thick, with cavity, and rough-cast: roofs of hand-made Staffordshire tiles. The architect states: "A special feature of the plan is the placing of one bedroom downstairs, so that when only two or three people are staying in the house it may be used as a small parlour. The yard has been placed at the side, and entirely walled off, so that there is no 'back' to the house."

Of cottages honourably mentioned in Class I. there are three:—No. 32, by Messrs. Lancaster & Atkinson, builders, of Fleetwood (cost £314, at 4⅛ per cub. ft.); No. 24 (cost £320, at 4·68d. per cub. ft., exclusive of site), for which Mr. Gilbert Fraser, A.R.I.B.A,, of Liverpool, was the architect—a cottage built with concrete blocks, identical with the one erected from Mr. Fraser's designs at Letchworth; and No. 8, a brick-built bungalow, by Messrs. Dickinson & Kirkham, of Mawdsley Chambers, Bolton, costing £251, at 3½d. per cub. ft.

Pairs of Cottages.

In Class II., for pairs of cottages, the first prize (£100) is awarded to Nos. 42 and 43, the architect for which was Mr. Q. Mangnall Bluhm, of Wood Street Chambers, St. Anne's-on-the-Sea, and 408, Temple Chambers, Brazennose Street, Manchester; the builders being Messrs. Lancaster & Atkinson, of Fleetwood. The cost of this pair of cottages is given as £430 (4$\frac{4}{10}$d. per cub. ft.). If duplicated, £500 (including builder's profit and architect's fees, but exclusive of site, fencing and sewers). There is a cupboard for cloaks, &c., in the porch; the coal-house is covered over; a wardrobe is provided in the first bedroom, and a cupboard in the living-room: hot and cold water are laid on to bath, lavatory and sink. The foundation is of cement concrete, 8ins. thick under main walls and 4ins. thick over whole site. External walls are of brick 11ins. thick, with a 2in. cavity, rough-cast and limewashed; roofs of Borrowdale thick green slates, from the Buttermere Green Slate Co., of Keswick: slab partitions by Fireproof Plate Wall Co., of Manchester; hearths, &c., formed with Van Straaten's hand-made Dutch tiles.

The second prize (£50) in Class II. is for the pair of cottages, Nos. 25 and 26. The architect of these is Mr. T. Faulkner Shepheard, of 13, South Bank, Birkenhead, and the builders Messrs. Leach & Sons, of Cleveleys. At 4¾d. per cub. ft., the cost is given as £222 for each cottage; if duplicated, £270 (including builder's profit and architect's fees, but exclusive of site, fencing, and sewers). On the upper floor a small cistern-room is provided, containing cistern, hot-water cylinder, and shelves for linen. The w.c., ashpit, and coalplace are in the yard. Foundations are of concrete, walls of brick 11ins. thick, built with a cavity, and rough-cast on face; roofs of hand-made Silverdale tiles. The architect's note on the cottages is as follows: "The houses have been placed on the site with the yard at the side, so as to leave the garden as uninterrupted as possible, with the windows of both rooms looking on to it. The bath-room, while conveniently reached from bedrooms, and well screened from the hall, can, at the same time, be used as a downstairs lavatory. The sinking of the larder will tend to make it cooler and better for storage of food, at the same time giving greater shelving space. By placing the cylinder next the cistern, the plumber's work is kept compactly together, whilst the cold water will be guarded against frost in the winter. Shelves are also provided round the cylinder for the storage of linen."

The cottages awarded the third prize (£25) in Class II. are Nos. 11 and 12. Mr. Alfred T. Martindale, of 66, Wellington Road, Bridlington, is the architect, and Mr. T. V. Martindale, also of Bridlington, the builder. £195 each cottage is the cost given, at 4½d. per cub. ft., and the same price if duplicated, plus 5% for removal of plant (including builder's profit and architect's fee, but exclusive of site, fencing and sewers). Foundations are of concrete

SMALL HOUSES AT ROSSALL BEACH, NEAR CLEVELEYS.

6ins. thick, with brick footings; external walls of brick 11ins. thick, hollow; roofs tiled; and stonework, Martindale's artificial stone.

Honourable mention in Class II. was given to the pair of cottages Nos. 28 and 29, of which Mr. John H. Mawson is the architect, and Mr. T. Riley the builder; cost £502 the pair, at 4½d. per cub. ft.

Prize Designs.

In the Classes III. and IV., for designs and specifications of cottages, the judges have made the following awards:—

Class III. (detached cottages).—First prize (£10), Messrs. J. Allen Spier & Thomas A. Beavan, Cardiff. Second prize (£5), Mr. E. A. Ould, F.R.I.B.A., Liverpool. Highly commended, Mr. W. G. Lewton, Reading; Messrs. Spier & Beavan, Cardiff; and Mr. W. R. Mosley, Slough.

Class IV. (pairs of cottages).—First prize (£10), Mr. David Peacock, Marple. Second prize (£5), Mr. E. A. Ould, F.R.I.B.A., Liverpool. Highly commended, Mr. W. G. Lewton, Reading; Mr. Harold Slater, Preston; and Mr. A. Brocklehurst, Manchester.

Our Plates

Cottage Flats and Laundry at Putney.

These cottage flats, which are in course of erection at Putney, have been designed with the intention of providing comfortable little homes for a superior class of people with refined tastes but small incomes. The work is designed as simply as possible without any pretention of architectural ornament, but depending upon the quiet beauty obtained by the craftsmanlike treatment of its honest material for effect, not only for the sake of inexpensiveness of production, but with the hope in view of in some way fostering the traditions displayed in the earlier homesteads of our countryside. The building has been treated as an architectural whole and contains four cottages of two flats, thus making eight complete homes, the accommodation to each comprising a parlour, three bedrooms, kitchen, scullery, bath, larder, w.c. and coal store, together with a small garden, access to which from the upper flats is obtained by a small internal staircase. The frontage to the road is being faced with thin Dutch bricks, five courses to the foot, while the back portions are to be built with cheaper bricks to match in tone. The roof is to be covered with hand-made thick red and brown tiles, laid in the old methods by Mr. R. Y. Ames, of Martin's Lane, Cannon Street. E.C.; the window frames and wood casements to be of deal, painted white; doors to have diamond lead glazing and to be painted green: and gutters and pipes to be of cast-iron with rain-water heads, and to be supported on wrought-iron brackets. A small laundry is to be built at the rear with ample drying ground, and a little pergola of oak, to be covered with creepers, is to be made to connect the offices to the laundry. Being placed opposite the cartway through the cottages it will afford a most pleasing view from the road. The builder is Mr. S. J. Bardall, of Balham and Hackney, and the architects Mr. William Hunt and Mr. Edmund Hunt, of Donnington House, Norfolk Street, Strand, W.C.

Notes and News

Fall of a Church Tower.—At Burlingham St. Peter, Norfolk, last Wednesday, the tower of the parish church collapsed. It was about 500 years old. The church was restored thirty years ago.

The City Bridges.—The accounts just published state that the cost of lighting, cleansing and repairing the City bridges during the past year was as follows:—London Bridge, £1,325; Southwark Bridge, £2,035; Blackfriars Bridge, £2,328.

The Columbian Fireproofing Co., Ltd., of 37, King William Street, London, E.C., have been successful in securing the contracts for the "Morning Post" building in the Strand, London; the new building adjoining the Bond Street Tube Station, London; and Washington Street Bonded Warehouse, Glasgow.

The Nantymoel Workmen's Hall, at Princetown, Glamorgan, has been enlarged at a cost of £2,500. A new stage has been provided, together with a billiard-room, committee and lecture rooms, and a lesser hall. Mr. J. Morris Williams, of Blackmill, was the architect for the work, and Mr. D. W. Davies the contractor.

Mr. Thomas Hardy, the novelist, who began life as an architect, has started a scheme for adding a tower to Holy Trinity Church, Dorchester, and has sent to the rector a sketch of his proposal "made in an idle moment." He hopes it may stimulate some wealthy lover of architecture to carry out the idea.

The New Stock Exchange at Manchester, fronting Norfolk Street and Pall Mall, is now approaching completion. The lower part of the building is treated with rock-faced light grey granite, whilst the upper storeys are faced with Portland stone. The architects of the building are Messrs. Bradshaw and Gass, of Bolton and London.

Large new Malting Premises are being erected at Sleaford for Messrs. Bass & Co. The work was commenced in 1901, and is estimated to cost half a million sterling. The buildings are not yet entirely completed. They comprise eight immense malthouses, central barley-drying kiln, engine and boiler houses, water tower, cottages for the leading hands, stables and waggon sheds.

Edict as to Wood-Block and other Floors.—The Concreters' and Ashphalters' Association at Manchester has altered its rules so as to include as members workmen who lay wood-block floors; such workmen, as a class, have been outside the pale of any organisation for years. It was also decided to make a section for concrete and asphalt labourers (who in the Manchester district number about 500), and another section for bricklayers' labourers. One month's notice is to be given to architects, surveyors, builders and others concerned, that in future members of the Concretors' and Asphalters' Association will refuse to prepare any ground for patent flooring, terrazzo, &c., for which cheap foreign imported labour is employed, displacing local British labour; and that all such work in future shall be done by members only of the Association and under proper conditions. It is alleged that at present a low rate of wages is paid to Italians and Germans who are brought into this country to do such work.

The New Transporter Bridge at Newport, Mon., is to be formally opened on September 12th.

New Council Offices at Swadlincote are being erected at a cost of £1,771 from designs by Mr. C. F. Underhill, of Swadlincote, the contractor being Mr. R. Kershaw, of Burton-on-Trent.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have recently secured orders for glazing on their "Eclipse" patent imperishable system the roofs of works extensions for Messrs. Cammell, Laird & Co., at Sheffield; Messrs. Markham & Co., at Chesterfield; and Messrs. Ruston, Proctor & Co., at Lincoln. Also electric car sheds at Sheffield, weaving shed for Messrs. Lupton & Sons, Leeds, and the Gibson Street swimming baths, Newcastle-on-Tyne.

The South Kensington Museum Extensions, which will cost more than £1,000,000, are making good progress. For more than three and a half years an army of workmen has been engaged on the building, and the shell is now practically complete, with the exception of the tower, which is to be 220ft. high. Messrs. Holliday and Greenwood are the contractors and Sir Aston Webb and Mr. E. Ingress Bell are the architects. The floor space of the new museum will be about 13 acres, the frontages to Cromwell Road and Exhibition Road being more than a quarter of a mile, taken together. The work will not be completed for another two years.

The Victoria Baths, Manchester, were opened by the Lord Mayor on Friday last. They occupy the site of the old Victoria Park Lawn Tennis Club in High Street, and comprise three swimming baths, Turkish baths and Russian baths. The work has been carried out by Messrs. C. H. Normanton & Sons, to the designs of the City Architect, Mr. Henry Price. The engineering work has been designed and carried out under the direction of Mr. L. H. Lewis, hydraulics engineer to the Waterworks Committee, while the machinery and equipment of the laundry has been the special care of Mr. J. Derbyshire, the manager of the Manchester Corporation Baths.

Collapse of a Framework Tower.—On Tuesday last week a man named Sharpe was killed through the collapse of a large iron tower at the service reservoir which is being constructed for the Metropolitan Water Board at Marmora Road, Honor Oak. To facilitate the transference of material, two iron framework towers, 65ft. high and 700ft. apart, with a wire cable slung between, had been erected for the contractors by Messrs. Henderson & Co., of Aberdeen. The towers were finished on the Tuesday, and Sharpe mounted one of them to watch the first load of 1½tons of concrete carried across. It had only travelled a short way when the foundations of the tower gave way and the erection fell. Sharpe made a jump for a large iron pipe below, but missed it, and struck the ground, being instantly killed.

Obituary.

Mr. F. W. Ledger, A.R.I.B.A., of Epsom, died on September 2nd, aged 50.

The late Mr. William Blyth, brick and tile manufacturer, of Barton-upon-Humber, who died on June 30th last, aged 79 years, left estate which has been proved at £14,306 gross.

Notes on Competitions

Cottage Models and Designs.

Mr. C. E. Bateman, of Birmingham, the assessor appointed in the competition for models and designs of cottages exhibited at the agricultural show at Bredon's Norton recently, has made the following awards:—*Models:* first prize (£15), Mr. Henry T. Weaver, of Gloucester; second prize (£10), Messrs. Hugo Bird and Robert Browne, of Brentwood. *Designs:* first prize (£10), Mr. A. Dennis Thacker, of Birmingham; second prize (£7), Messrs. S. Cooke and Norman Twist, of Birmingham. The designs by "Red Lion" and by Messrs. Crouch, Butler and Savage were referred to in commendatory terms.

Carnegie Library, Plymouth.

At the last meeting of the Plymouth Free Library Committee it was decided that the competition for a new Carnegie Library to be erected in the borough should be restricted to local architects, not open. The president of the R.I.B.A. is to be asked to nominate an assessor, but nothing has yet been settled about premiums.

Transvaal University College.

In the recent competition among South African architects for new buildings of the Transvaal University College to be erected at Johannesburg, Mr. T. E. Collcutt, F.R.I.B.A., the assessor, has awarded the first premium to the design of Mr. R. Howden, the second to that of Messrs. Dickson & McCowat, the third to that of Messrs. Stucke & Bannister, the fourth to that of Messrs. Till & Till, the fifth to that of Messrs. McIntosh & Moffat, and the sixth to that of Messrs. Leck & Emley—all of Johannesburg. Twenty-eight architects competed. For the present the eastern wing of the new college is only to be proceeded with, the estimated cost of this work being £80,000.

Dartmouth Town Hall and Market.

At last week's meeting of the Dartmouth Town Council the Special Committee reported that, acting upon the request of his solicitors, Mr. Montague Luke, architect, of Plymouth, whose designs for the new town hall and market received the first premium in the recent competition, had sent the plans and specifications in order to obtain tenders. Mr. Roberts said he should strongly object to the plans being accepted for the purpose mentioned unless they were in accordance with the original design as sent in for competition. He understood that the plans had been cut down, altered, and amended. Alderman Ellis thought this was a matter for the Council to decide when they had the plans before them. Until they had seen them they could not arrive at any conclusion. Mr. Row proposed that the matter be referred to the Special Committee, and if they approved of the plans, to report to the General Purposes Committee accordingly. Mr. Grant seconded, and the proposition was carried.

Carnegie Libraries, Dundee.

The memorial addressed by architects in Dundee to the Town Council urging that the design of the Carnegie branch libraries should be made subject to open competition, and not placed in the hands of the City Architect (see p. 113 of our issue for last week) has not been successful, as the latter course has been adhered to, it being estimated that a saving of £1,000 will thus be effected.

List of Competitions Open.

DATE OF DELIVERY	COMPETITION.
Sept. 20	SCHOOL AT SUNDERLAND. Limited to local architects. Premiums of £5o, £20 and £10. Particulars from John W. Moncur, Borough Engineer, Town Hall, Sunderland.
Sept. 21	CONVALESCENT & NURSES' HOME AT GLOSSOP. Premiums of £20 & £10. Particulars from Mr. T. W. Ellison, Town Clerk, Norfolk Chambers, Glossop.
Sept. 22	SEWERAGE SCHEME FOR NEWCASTLE, Co. DOWN. Terms, references, experience, by this date, to Daniel Curran, Town Clerk.
Sept. 28	COTTAGE HOMES AT CLEADON and receiving house at workhouse, for Guardians of South Shields Union. Particulars from J. W. Coulson, Union Offices, South Shields.
Sept. 28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, clerk to Urban District Council, Ellesmere.
Sept. 29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50 and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Sept. (last week	PREMISES AT LEVEN, for Reform Co-operative Society, Ltd. Particulars from D. C. Wilson, secretary.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
Oct. 20	SEWERAGE SCHEME FOR HIGHBRIDGE, Somerset. Premium £20. Particulars from W. C. Shier, Surveyor to the U.D.C., Highbridge.
Oct. 22	SCHOOL AT GAYWOOD, King's Lynn. Particulars from Secretary, County Education Office, 57, London Street, Norwich.
Oct. 31	BOURSE AT CAIRO.—Premiums of £E250 and £E100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Dec. 14	FOUNDLING HOSPITAL, MONTEVIDEO.—Four selected designs in preliminary competition to be awarded £212 each; first premium of £742 in final competition. Particulars from Consulate-General for Uruguay, 5 & 6, Clement's Inn, London, W.C.
No date	LIBRARY AT FRIBOURG, Switzerland. (International competition.) Particulars from "La Direction des Travaux Publics," Fribourg.

LANGHO COLONY FOR EPILEPTICS.

The colony for sane pauper epileptics just completed at Langho, near Blackburn, by the Joint Committee of the Manchester and Chorlton Boards of Guardians, is noteworthy as the first State institution of its kind in this country. There are in England at present at least 60,000 victims of epilepsy. Every year about 3,000 people die from the disease, the great bulk being of the poorer class.

At Langho, Manchester has founded a system which it is fully anticipated will be followed by Poor-law authorities of other great centres. The estate which has been acquired comprises 166 acres, and the buildings at present erected number 16, giving accommodation for 272 patients and the staffs. Six homes have been provided, 3 for men and 3 for women, and they will accommodate 40 inmates each. These buildings are alike in plan, but a certain amount of variety has been introduced on the exterior. On the ground floor is a central hall, approached through a vestibule from an entrance verandah. This central hall gives access to the principal rooms on the floor, comprising a well-lighted dayroom, 34ft. by 20ft., a small room for patients seized with a fit or requiring temporary seclusion, a boot and cloak room, a dining-room 25ft. by 20ft., crockery store, larder and other conveniences. From the central hall a staircase leads to the first floor, on which are provided two dormitories, each 49ft. by 20ft. and containing eighteen beds, three single bedrooms, a lavatory and bath-room, and sanitary accommodation in a separated annexe.

The "homes" have, as far as possible, a cheerful, domestic and homelike character. There are workshops for brushmakers, upholsterers, carpenters, tailors, shoemakers, and plumbers.

Water supply is taken from the Blackburn mains, drainage and sewage purification on the septic tank system have received most careful attention, and electricity generated on the premises is the light for the whole of the buildings.

Apart from the cost of the land, which amounted to £13,267, an expenditure of £75,500 has been authorised on the buildings, but the administrative block has been erected on a scale sufficient for the needs of a much larger colony than that at present existing.

The architects for the colony are Messrs. Giles, Gough and Trollope, of London, and the contractors Messrs. Robert Neill and Sons, of Manchester.

SALARIES OF OFFICIAL ARCHITECTS.

Although the aggregate of salaries paid by the United States Government is enormous, it is a fact that the individual responsible official is notoriously underpaid, and of the underpaid officials probably the "best bargain" for the Government is the present supervising architect, who must smile rather grimly when he compares his $4,500 salary (£900) with the real worth of his service, as measured by the standard of private practice. "But," says the "American Architect," "if a salary commensurate with his work and responsibility were assigned to him, his office would at once become one of the largest political 'plums' which the Administration has to give away, and, consequently, the objective of political adventurers of the most undesirable type. The office under the present scale of compensation has attractions, first, for the 'cheap' and incapable man, to whom the salary seems even large, the very man who should not have it, that is; second, for the young and untried man, who may at bottom be qualified to do good work eventually, but who should not, simply because he is young and untried, have this important trust; third, for the tried and capable man who can, with difficulty, be persuaded to sacrifice a good deal for the sake of name and fame; and, lastly, for the architect of independent means, good artist or poor one, who is willing to do the work because of his love of art or pride of country. The salary could with propriety be trebled: in common justice and decency it should at least be doubled. The present situation is particularly unfair because, while a large part of the clerical and draughting force in the office has been brought under the Civil Service rules, the Supervising Architect himself has not this protection."

In comparison with the foregoing it is interesting to note that the salary of Mr. W. E. Riley, Superintending Architect to the London County Council, is £2,000 a year; Mr. T. J. Bailey, London County Council (Education) Architect, £1,200; Sir Henry Tanner, Principal Architect to H.M. Office of Works, £1,200; and Mr. W. T. Oldrieve, H.M. Office of Works (Edinburgh), £1,000.

We are so accustomed to hear of the great salaries which are paid to high officials in the United States that these figures are particularly suggestive.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
Correspondents are particularly requested to be as brief as possible.

Porcelain Lined Bath.

LONDON—T. T. writes: "What can be done to renew the polish of a porcelain lined bath, which has all gone after 12 months' use? The enamel seems sound."

We can only suggest burnishing it.

R.I.B.A. Intermediate Examination: Second-hand Architectural Bookseller.

RHYL. — PROBATIONER writes: "(1) Please give list of books required for R.I.B.A. Intermediate Examination. The list given in the R.I.B.A. Kalendar is, I presume, larger than is absolutely necessary. I want to know the minimum that would suffice. (2) Kindly give address of a dealer in second-hand architectural, &c., works."

(1). The R.I.B.A. examination is intended to prove the qualifications of a practical architect intending to practise, and the books recommended in the Kalendar for study contain far less than the minimum of knowledge that should be possessed. Many of the works, it is true, need not be purchased for permanent possession, and a student need not do more than borrow them from a library, but he should certainly read all, and more. The student should purchase the following general works:—Gwilt's Encyclopedia, Hurst's and Molesworth's Pocket Books, Laxton's Price Book, Spier's "Orders," Fletcher's History, Rivington's Building Construction, "Specification," Leaning's "Quantity Surveying" (2). Mr. B. T. Batsford, 94, High Holborn, W.C.

Carving by Machinery.

MANCHESTER writes: "Can you give name and address of firms who do wood carving by machinery?"

The Automatic Sculpture Syndicate, Ltd., 62 and 64, Sumner Street, London, S.E.

Boot Factories.

DUDLEY.—READER writes: "Where can I obtain information on the very latest style of planning and fitting up of boot factories?"

No information appears to have been published upon this subject.

Concreted Market Square.

LONDON.—R. H. W. writes: "A market square in a certain town has been concreted and finished with cement floating, the gauging for concrete being 1 part Portland cement, 3 parts sea shingle, 2 parts sand, and the floating composed of 1 part cement to 1 of sand. Some of the floating is now flaking up, although it was laid before the concrete was set. The cement passed the surveyor's test and the gauging of the above was strictly adhered to. The square is also used as a right of way for all traffic—even traction engines could go across. Would it not have been better to have laid it in one bulk and worked up to a smooth surface?"

If the work was done properly, as stated by you, it should have been satisfactory. It is of vital importance that the top floating coat should be put upon the under-surface of the concrete while the latter is green, and the fact that in this case the top coat has flaked up makes us think that, notwithstanding what you say, the surface of the concrete was allowed to become dry; hence there was no adhesion between the two. The main part of the concrete, however, was poor for such traffic as exists in the market place, and if the floating coat were very thin it would be easily disintegrated. The coating should have been at least about 2ins. thick, and we should have been inclined to have made it 4ins. thick, composed of 1 part Portland cement and 2 parts granite chippings. To have laid the work in bulk in the poor proportions you state would not have been satisfactory, but undoubtedly it would be best to put on the finishing coat before the foundation was quite set.

Laundry Machinery.

MANCHESTER.—C. writes: "Have you ever published plans and description of a modern machine laundry? Also, is there a good book on the subject?"

We have published the working drawings of the laundry at the Camberwell Infirmary in the current issue of "Specification" (price 2s. 6d. nett or 3s. 3d. post free from our offices). The only book we are aware of on the subject is "The Steam Laundry," by J. Taylor (price 7s. 6d. post free from our offices).

Illustrations of Old and New Buildings.

HORSHAM.—CIVIS writes: "Can you tell me where drawings, views, &c., of the following have been published?—Kennel Park Church (Nesfield), Lyndhurst Church, Hampshire, Church at Exeter (Caröe), Church at Wonersh (Harrison Townsend), Westminster Hall, Guildhall, Crosby Hall, Middle Temple Hall, and other Elizabethan Halls in London, Queen's Hall, Leysian Hall (City Road), Colston Hall (Bristol), Battersea Town Hall."

Plates showing drawings of the interior of Middle Temple Hall will be found in Vol. 2 of "Weale's Quarterly Papers on Architecture." Information upon the Elizabethan Halls in London will be found in the following works:—"A Collection of Ancient Timber Edifices of England," J. Clayton; "Architecture of the Renaissance in England," J. A. Gotch; "Mansions of England of Olden Time," J. Nash; "Observations on the Architecture of England during the Reigns of Queen Elizabeth and James I.," and "Architectural Remains of the Reigns of Elizabeth and James I.," Richardson. Illustrations of most of the other buildings you mention have been published in one or other of the building papers. Consult back numbers.

H. Y. M.

Books for Municipal and County Engineers' Examination.

WINCHESTER.—WINTON writes: "I intend reading for the examination of the Incorporated Association of Municipal and County Engineers and should be glad to know what books to get. I specially want a good book on water-works engineering and one on tramway construction. I already have the following:—'Mechanics Applied to Engineering' (Goodman), 'Principles of Planning' (P. L. Marks), 'How to Estimate' (Rea), 'Surveying' (J. Whitelaw, junr.), 'Building Construction' (Henry Adams), 'Building Construction' (Chas. F. Mitchell), 'Specification No. 8,' 'Municipal Engineer's Specification No. 1.'"

We suggest the following:—"The Sewage Problem," by Arthur J. Martin, 7s. 6d.; "Sanitary Engineering," by Colonel Moore, 32s.; "Practical Sanitary Engineering," by Francis Wood, 8s. 6d.; "Municipal and Sanitary Engineers' Handbook," by Boulnois, 15s.; "Destructors and Disposal of House Refuse," by W. H. Maxwell, 17s. 6d.; "New Streets—Laying Out and Making Up," by J. Taylor Allen, 3s. 6d.; "Road-making and Maintenance," by Thos. Aitken, 21s.; "Roads: Their Construction and Maintenance," by Greenwell & Elsden, 5s.; "Sanitary Law and Practice," by Robertson & Porter, 21s.; "Water and its Purification," by S. Rideal, 9s.; "Water-works Distribution," by B. J. M. McPherson, 6s.; "Water Supply Engineering," by A. P. Folwell, 17s. These books can be obtained post free from our offices at the prices given.

Building Trade in Canada.

LONDON.—W.T. writes: "Will you kindly inform me what prospects there are for architects and builders in Canada?"

In recent issues we have replied to numerous enquiries on this subject, and we have no more of our own knowledge to add. We notice, however, a letter from a correspondent in Toronto which appears in our contemporary the *Ironmonger*, setting forth some particulars likely to be of service to the querists who have addressed themselves to us in these columns. The correspondent in question says: "In Toronto this year the building trade is very brisk. In the fortnight ending June 30th last, official permits were granted for the erection of 186 dwellings and other buildings in this city alone at an estimated cost of $636,000 (£127,500). Canadian plumbing is carried out upon the American style, drawn steel and copper down-pipes (nickel-plated) being used in place of lead. Smart one-piece enamelled cast-iron rolled-edge baths are general, and are used without casing. Every decent six-roomed house has its bath-room and water-closet on the first floor, with hot and cold water service, and most of them are also fitted with electric light and gas, and heated with warm air or hot water. The kitchen stove is always the tenant's movable property, but some of the better-class houses have sitting-room fireplaces and log-hearths in addition to their furnace."

INSTITUTE OF SANITARY ENGINEERS.

The following is the syllabus of twenty-five lectures in practical sanitary science and engineering to be delivered at the Institute of Sanitary Engineers, 19, Bloomsbury Square, W.C., during the forthcoming session:—

Oct. 2—Mechanical Physics. N. W. Hoskins.
,, 9 and 16—Building Construction so far as it relates to Sanitation. Geo. W. Chilvers.
,, 23 and 30—Details of Plumbers' Work and Sanitary Appliances. Richard Horton.
Nov. 6—Hydraulics and Hydrostatics. N. W. Hoskins.
,, 13—Sewerage and Drainage. A. J. Martin.
,, 20 and 27—Scavenging and Disposal of Refuse. W. H. Maxwell.
Dec. 4—Water and Water Supply. H. W. G. Macleod.
,, 11—Sewage Disposal. W. J. Dibdin.
,, 18—The Atmosphere and Meteorology. N. W. Hoskins.
1907.
Jan. 8 and 15—Heating and Hot Water Supply to Buildings. A. E. Abbott.
,, 22—Lighting. W. J. Dibdin.
,, 29—Ventilation of Dwellings and Public Buildings. W. H. Maxwell.
Feb. 5—Disinfection and Disinfectants. J. T. Griffin.

CHELSEA'S NEW BATHS.

How the Artesian Well Was Made.

In connection with the new public baths which are being erected in Manor Street, Chelsea, under the direction of Mr. Alex. McDonald (engineer to the Baths Committee), an artesian well has been bored. It is interesting to give a few particulars of this work. The boring was done by a hand drill, four men being at work, and the lifting of the bored material was effected by a steam winch. The steel bore tube is 13½ins. in diameter and its upper end is encased in a protecting tube 15½ins. in diameter. The work of boring was commenced on September 14th, 1905, and ceased on February 24th, 1906, at a depth of 463ft. 8ins. below the roadway in Manor Street. The average rate of sinking for the whole bore was about 3ft. 5ins. per day, but in the chalk the average rate was 4ft. 3ins. per day. The contract price for the boring was for the first 100ft. 17s. per ft., increasing 1s. per ft. for every 100ft. sunk. The contractors were Messrs. E. C. Potter & Co., Lant Street, Borough, S.E. The water now stands in the boring at a depth of 120ft. from the surface. The total cost of the well with plant complete (not including boilers) will be £1,153. The pump will be supplied by the Rand Drill Co., of New York. It will have a lifting capacity of 12,000 gallons per hour. The total capacity of the storage tanks will be about 120,000 gallons. Work on the erection of the new baths was commenced about June last year and is expected to be completed about next January. The builder is Mr. A. N. Cole, of Plymouth and London, and the engineers are Mesers. Crittall & Co., of London.

WYATT.

St. Peter's Church, Manchester, is being pulled down. A notice of the building appeared recently in the *Manchester Guardian*, in which the architect of the church was spoken of as "Mr. James Wyatt, the Manchester architect." Mr. Charles H. Wyatt, of Chelford, writes pointing out, however, that the architect of St. Peter's must surely have been James Wyatt, R.A., who became almost, if not quite, president of the Royal Academy. "Even his enemies admitted that he was president-elect. He built the mansion at Heaton Park in 1772 for Sir Thomas Egerton (afterwards the first Earl of Wilton), but can hardly be described as a Manchester architect. A *protégé* of Lord Bagot, Ambassador to the Pope, he was taken to Rome to study architecture, where Wyatt made good use of his four years' stay, subsequently spending two years in Venice. Four years later he was elected an Associate of the Royal Academy, and afterwards duly became an Academician. He successfully adapted the old Pantheon in Oxford Street, London, for dramatic performances, and hence rapidly rose in popularity. In 1795 he erected Fonthill Abbey for Mr. Beckford. The great revival of interest in Gothic architecture was largely due to James Wyatt. He was concerned in the restoration of Hereford, Lincoln, Salisbury and Lichfield Cathedrals. It has been well said 'there is scarcely a county or large town in the country in which Wyatt did not erect some public or private building.' He was killed by a carriage accident near Marlborough in his 68th year, and was buried in Westminster Abbey on the 28th of September, 1813."

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Ashburton.—For the erection of villa residences on the Druid Estate, together with entrances and approach roads, for the Ashburton Building Co. Mr. R. Montague Luke, architect, 15, Princess Square, Plymouth:—

White, Chatton & Co., Torquay	£1,989	15	7
J. Coneybeare, Ashburton	1,795	12	1
Yeo & Sons, Torquay	1,732	9	3
Wakeham Bros., Plymouth	1,685	0	0
Drew, Paignton	1,587	0	0
Badcock,* Ashburton	1,525	11	0
Narracott, Stoke Gabriel	1,474	11	6

* Accepted subject to revision.

Barry.—For the erection of public offices, in Holton Road, for the Barry U.D.C.:—

A. Richards	£8,610	0	9
Jones Bros.	8,600	0	0
Lloyd & Tape	8,540	15	10
W. Britton	8,270	0	0
H. S. Rendell	8,050	0	0

IMPORTANT TESTS OF OPEN DOMESTIC GRATES

carried out officially by The Smoke Abatement Society in conjunction with H.M. Office of Works, at the New Government Buildings in Parliament Street, London.

See Report in "Lancet," May 19th, 1906—

> "As a final result of the whole of the tests, the examiners find that of the Grates submitted those of Messrs. Candy & Co., and two other firms, are the best, showing practically equal results. The amount of coal consumed by these grates was found to be moderate in comparative proportion with temperature obtained; the fires were bright and clear."

N.B.—Thirty-seven grates were tested, including nearly all the best known modern types.

THE STANDARD TEXT-BOOKS ON BUILDING CONSTRUCTION.

Adopted in all the Principal Technical Schools.

READY SEPT. 17. 7th EDITION, REVISED, RE-ARRANGED AND GREATLY ENLARGED.

470 pages with **1,100** Illustrations (fully dimensioned). Crown 8vo, cloth, price **3/-**

BUILDING CONSTRUCTION.

ELEMENTARY COURSE.

A Text-Book on the Principles and Details of Modern Construction.

By **CHARLES F. MITCHELL.**

Lecturer on Architecture and Construction at the Polytechnic Institute, Regent Street, London.

Assisted by **GEORGE A. MITCHELL.**

The Builders' Journal says:—"It is undoubtedly the best work a student can obtain on elementary construction. The illustrations now number more than a thousand, and are most clearly drawn. The price is wonderfully low."

The Builder says: "The book is a model of clearness and compression—well written and admirably illustrated—and ought to be in the hands of every student of building construction."

READY SEPT. 17. 5th EDITION, REVISED, RE-ARRANGED AND GREATLY ENLARGED.

800 pages with **750** Illustrations (fully dimensioned). Crown 8vo, cloth, price **5/6.**

BUILDING CONSTRUCTION.

ADVANCED AND HONOURS COURSES.

A Text-Book on the Principles and Details of Modern Construction.

By **CHARLES F. MITCHELL.**

Assisted by **GEORGE A. MITCHELL.**

The BUILDER says:—"Mr. Mitchell's two books form unquestionably the best guide which any student can obtain at the present moment. In fact, so far as it is possible for anyone to compile a satisfactory treatise on building construction. Mr. Mitchell has performed the task as well as it can be performed. . . . The two parts together should be in the hands of every architect's pupil, and will be found excellent value for their small price.

Electrical Notes.

Standard Specification for Conduits.

In former issues we have drawn attention to the excellent work being done by the Engineering Standards Committee towards establishing British standard specifications for various kinds of work. They have now issued a standard specification for steel conduits for electrical wiring. The desirability of standardising these conduits was brought to the notice of the sub committee on Electrical Plant Accessories in February last, and the manufacturers of steel conduits accepted the invitation of the committee to give evidence on the subject. A sectional committee on screw threads and limit gauges was also consulted with regard to the question of threads, the clauses in the specification dealing with gauging being based on the recommendations of that committee. The chairman of the sub-committee was Mr. C. H. Wordingham, and besides representatives of the Admiralty, War Office, Board of Trade, &c., there were two representatives nominated by the National Electrical Manufacturers' Association, and a number of other specialists whose names are well known in the electrical world. The committee, therefore, was a thoroughly representative and influential one. The specification states that steel conduits for electrical wiring shall be either close-joint, brazed, welded or solid drawn, and stove enamelled or galvanized inside and out. There are to be two classes—namely, plain and screwed, both made in straight lengths of 10, 12, or 14ft. and of specified thicknesses, the average thickness to be determined by weighing not less than 100ft. Three classes of screwed gauges are recognised—namely, standard screwed gauges, reference screwed gauges, and shop screwed gauges. The specification can be obtained from Messrs. Crosby Lockwood & Son, 7, Stationers' Hall Court, Ludgate Hill, E.C., price 2s. 6d. nett.

Electric Radiators.

A very effective-looking electric radiator has been put on the market by the Carron Co., the well-known fire-grate makers of Carron, Stirlingshire. It comprises an ornamental cast-iron front and top with four heating lamps connected in circuits of two lamps and controlled by separate switches. The maximum consumption per hour is 1·06 B.T. units, and the minimum ·53 units, while the lamps will burn 1,000 hours without renewal. The price of the radiator is just over £5.

Precautions while Painting Electrical Work.

A workman while engaged recently in painting the standards for the electric trams at Newport, Mon., received a severe shock, and had to be removed to the hospital, where it was found that his arm was somewhat burnt. The mishap was said to be due to a leakage from the trolley wire. The occurrence, says the *Decorator*, suggests the advisability of painters who are engaged on electrical works taking measures to prevent injury in cases of this kind. Usually there is no danger to be apprehended by painters if they take care not to touch the trolley wires, but when working close to them, it is advisable to use rubber gloves, especially on the hand used for steadying—namely, the left, and this, of course, leaves the right hand free to hold the brush. Mr. S. B. Cotterell, engineer and manager of the Liverpool overhead railway, has issued a paper on this matter. He says: "If ordinary caution is observed in handling electric cables, wires, or apparatus, no danger need be apprehended. Regard any apparatus with which you may have to deal as capable of affording a shock, and adopt precautions accordingly. When it is necessary to touch part of such apparatus when the current is active, the individual should be careful that his entire person is insulated from the earth, and from anything, other than an insulating medium, which connects with the earth. This may be best achieved by standing on an india-rubber mat. On no account should he touch parts of the machinery, cables, or apparatus with both hands at the same time, unless his hands are protected by sound india-rubber gloves. Shoes with india-rubber soles may be worn as an extra precaution, but the wearer must never rely upon them for insulation."

A Public Laboratory Museum.

Next month a Laboratory Museum of Electricity will be opened to the public at Brussels. Its object is the development and extension of the use and application of electricity in Belgium by practical experimental instruction. The institution will contain all kinds of electrical models and appliances, which may be freely handled for study and experiment. Models and apparatus will be conveniently placed at the disposal of the public upon separate tables, and may be connected with the electric supply at will. There will also be free telegraph, wireless telegraph and telephone offices.

NOTE.—There are things one cannot forget. One is that "ROYAL EDISWAN" LAMPS are BEST and CHEAPEST in the END.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Sept. 13. Fetteresso.—*Erection of house* for overseer, and steading of offices at Home Farm, Fetteresso. Plans and specifications may be seen with Alexander Forbes, Fetteresso Estate Offices, 12, Ann Street, Stonehaven, who will receive tenders for the works up to Sept. 13.

Sept. 13. Ruislip.—*Construction of a brick wall about 333 yards in length* to Ruislip Churchyard. Plans and specifications may be seen and examined at the Manor Farm, Ruislip. Sealed tenders, endorsed "Tender for Wall," to be delivered to H. J. Ewer, The Manor Farm, Ruislip, not later than midday, Sept. 13.

Sept. 13. Abersychan.—*Alterations and improvements at Abersychan Council School and at the Park Street Boys' School, Blaenavon.* Plans and specification can be seen at the offices of Mr. H. J. Griggs, architect, Newport, Mon. Tenders endorsed "Abersychan School" and "Park Street School" respectively, to be sent to Henry Bythway, clerk to the managers, Pontypool, by noon Sept. 13.

Sept. 15. Bargoed.—*Erection of a vestry* for the Welsh Baptist denomination. Tenders to be sent in to Mr. Mark Old, 20, Henry Street, Bargoed, on or before Sept. 15. Plans and specifications may be seen with the above or with P. Vivian Jones, P.A.S.I., architect and surveyor, Hengoed.

Sept. 15. Dowlais.—*Erection of 38 workmen's houses* at Penywern. Plans may be inspected and specifications obtained at the office of the Borough Surveyor, Merthyr Tydfil, on payment of £1 1s., which will be returned upon receipt of a bona fide tender. Tenders marked "Penywern Houses" must be delivered to T. Aneuryn Rees, town clerk, Town Hall, Merthyr Tydfil, on or before Sept. 15.

Sept. 15. Hounslow.—*Erection of a new infants' school at Spring Grove*, to accommodate 350 children, for the Heston and Isleworth U.D. Education Committee. The plans may be inspected at the office of A. Lang, architect, Council House, Hounslow, where also bills of quantities may be obtained, together with specification and form of tender, on payment of a deposit of £2 2s. Tenders on the forms supplied, to be delivered to H. J. Baker, clerk to the committee, Council House, Hounslow, not later than 12 noon on Sept. 15, endorsed "Tender for Spring Grove Infants School."

Sept. 17. Gwauncacgurwen.—*Erection of a new C.M. chapel.* Plans and specifications may be seen and bills of quantities obtained at Anchor House, Cwmgorse, upon the receipt of £2 2s., which will be refunded upon receipt of a bona fide tender. Tenders to be delivered to the Secretary, David Jones, Anchor House, Cwmgorse, not later than Sept. 17.

Sept. 17. West Bromwich.—*Repairs, painting, and other work*, at the district schools, Wigmore, West Bromwich. Specification and conditions of contract may be seen and forms of tender obtained at the office of Mr. John W. Allen, architect, High Street, West Bromwich. Tenders, under seal, marked "Repairs, Painting, &c.," must be sent to H. Ward, clerk, Church Street, West Bromwich, on or before Sept 17.

Sept. 17. Portsmouth.—*Pulling down a chimney shaft* about 75ft. high in the Asylum Grounds at Milton. The contractor will be required to erect scaffolding and supply plant, to carefully take down chimney, and clean and stack the old material (which is to remain the property of the Committee of Visitors) upon a site about 107yds. distant from the chimney, and cart away the old mortar and other débris. Fair wages clause. Tenders endorsed "Tender for Pulling Down Chimney Shaft," to be delivered at the Town Hall, Portsmouth, not later than 10 a.m. on Sept. 17.

Sept. 17. Gainsborough.—*Pulling down and rebuilding premises in Bridge Street*, Gainsborough, belonging to the Gainsborough Industrial Co-operative Society, Ltd. Bills of quantities and form of tender may be had on application to Scorn and Gamble, architects, Bank Street Chambers, Lincoln, on or before Sept. 5 and on payment of £2 2s. The drawings and conditions of contract may be inspected at the offices of the architects. Tenders must be delivered to the manager at the office of the Society, 11, Bridge Street, Gainsborough, and in the envelope provided for the purpose, before 10 a.m. on Sept. 17.

Sept. 17. Maesteg, &c.—(1) *Alterations and additions* at the Blaenllynfi Council School, Caerau, near Maesteg. (2) New temporary cookery and infants' school at the Troedrhiwfuwch Council School. (3) New classrooms to the mixed department at Ely Council School. (4) Minor alterations and additions at Pontyrhyl Council School. Forms of tenders and further particulars may be obtained of F. E. Boaz, surveyor, Council Offices, Hale, Cheshire, between the hours of 9 a.m. and 5 p.m., to whom all enquiries should be addressed. Tenders to be forwarded not later than Sept. 15 to J. G. Whyatt, clerk to the Council

Sept. 17. Westhampnett.—*Cartage* of flints and gravel from the roadside depots. Quantities, situation of depots, conditions, and dates of cartage, &c., may be obtained of the Council's surveyors, Mr, J. J. Budden, of 4, St. Pancras, Chichester, and Mr J. H. Hobgen, of 43, Lyndhurst Road, Chichester. Forms of tender, endorsed "Tender for Cartage," must be delivered to William Duke Rasell, acting-clerk to the R.D.C., 5, South Street, Chichester, on or before Sept. 17.

Sept.18. Spennymoor.—*Supplying and laying new concrete flags and kerbing* for a portion of High Street, Spennymoor, for the U.D.C. Plans and specifications may be seen, and forms of tender obtained, on application to Mr. C. R. Spencer, surveyor to the Council, Silver Street. Spennymoor. Tenders, marked "High Street Footpath," to be sent to F. Badcock, clerk, Council Offices, Spennymoor, not later than Tuesday, Sept. 18.

Sept. 24. Witham.—*Use of Steam Roller and Scarifier*, to include driver, flagman and coal, at such times and places as the surveyor, Mr. W. P. Perkins, Witham, may direct. Tenders, endorsed "Tender for Steam Roller," to be sent by Monday, Sept. 24, to Wm. Bindon Blood, clerk to the U.D.C., Witham, Essex.

Sept. 24. Otley.—*Sewering, paving and making good of Back Garnett Street* for the U.D.C. Drawings and specification may be seen at the offices of J. E. Sharpe, engineer and surveyor, Council Offices, Otley, where quantities may also be obtained on depositing cheque for £1 1s. Sealed and endorsed tenders must be delivered at the office of J. E. Sharpe not later than 2 p.m. Sept. 24.

No date. Blandford.—*Steam rolling* for one year. For specifications and forms of tender apply to Edward Phelps, district surveyor, Blandford, Dorset. Tenders, endorsed "Tender for Steam Rolling," to be sent to Sinclair Triall, clerk to the Council, Blandford, Dorset.

SANITARY.

Sept. 13. Plympton St. Mary.—*Excavating and laying* about 300ft. of 6-in. stoneware pipe sewer and building manholes, in the village of Brixton, for the R.D.C. Plans and specifications may be seen at the office of John W. Bickle, solicitor, Temple Chambers, Westwell Street, Plymouth, to whom sealed tenders must be sent, endorsed "Brixton Drainage," not later than Thursday, Sept. 13. Further particulars may be obtained on application to Mr. W. E. Horton, sanitary inspector, Plympton.

Sept. 17. Seaford.—*Construction of about 1,300yds. of 9-in. pipe sewer*. with manholes and other incidental works in Firle Road and Blatchington Street, for the U.D.C. Plan and specification may be seen and bills of quantities obtained at the office of the Engineers, Messrs. Pollard and Tingle, MM.I.C.E., 31, Old Queen Street, Westminster. Sealed tenders, endorsed "Firle Road Drainage," to be sent to W. H. Pawson, clerk, Council Offices, 3, Clinton Place, Seaford, Sussex, not later than 4 p.m. on Monday, Sept. 17.

Sept. 17. London, W.—*Re-drainage and sanitary work at the Nurses' Home, St. Marylebone Infirmary*, Rackham Street, Notting Hill, W. Persons desiring to tender may inspect the specification and drawing, and obtain bills of quantities and form of tender, between the hours of 10 a.m. and 4 p.m. (Saturday 10 a.m. to 1 p.m.), upon application to the Guardians' architect, A. Saxon Snell, F.R.I.B.A., of 22, Southampton Buildings, Chancery Lane, W.C., and depositing with him a £10 Bank of England note. Tenders to be signed, sealed, and endorsed "Tender for Re-drainage and Sanitary Work at the Nurses' Home," and addressed and delivered to H. T. Dudman, clerk to the Guardians, Guardians' Offices, Northumberland Street, Marylebone Road, W., at or before 10.30 a.m. on Sept. 17.

Sept. 18. Blaina.—*Re-construction of the drainage and the erection of a lavatory at Blaina Central School.* Plans and specifications may be seen at the office of R. L. Roberts, M.S.A., Abercarn. Quantities supplied. Sealed tenders, endorsed "Tender for Drainage, &c., Blaina Central School," are to be delivered to C. Dauncey, clerk of the Group, County Council Offices, Newport. not later than Sept. 18.

Sept. 19. Wigan.—*Cleansing of privies, ashpits and cesspools* (all farm premises excepted) in Parbold, Shevington, Haigh. Worthington and Wrightington, divided inio the following sections :—Section No. 1, the whole of Parbold; Section No. 2, the west portion Wrightington, from the road leading from Dangerous Corner, Courage Lane and Toogood Lane; Section No. 3, the east portion of the said road, including Mr. Watson's house; Section No. 4, the portion lying to the south of Wrightington Hall Lane; Section No. 5, the south-west portion of Shevington, including Back Lane, Miles Lane, Broad-o'th'-Lane, Church Lane, and Gathurst Lane; Section No. 6, the north-east portion, including Shevington Moor, Almond Brook, Barracks, and Foxfield; Section No. 7, the village of Crooke; Section No. 8, the east side of the canal of the township of Haigh; Section No. 9, the west side of the canal of the township of Haigh; Section No. 10, the whole of the township of Worthington. Tenders must be for the term of one year, from the 1st October, 1906, except Section No. 6, which is for a term of one year from the 1st November, 1906, and may be for one or more sections, and must be sent in not later than Sept. 19, endorsed "Scavenging," to the Clerk to the Council, H. Ackerley, 9, Victoria Buildings, King Street, Wigan.

MISCELLANEOUS.

CONCRETE AND STEEL SUPPLEMENT (MONTHLY).

REINFORCED CONCRETE SEWERS, CONDUITS, &c., BUILT *IN SITU*.

By Frederick Purton.

The upkeep and renewal of sewerage works that have been constructed in brick are a continual source of expense to the ratepayers of the country. The failure of such works is being constantly recorded; and, to take only one out of several recent cases, the Borough Council of one of the suburbs of London have hardly completed one costly reconstruction scheme when they find it imperative to call upon the ratepayers to provide another large sum of money for similar works to make good a breakdown in another portion of their district.

The question therefore arises:

Is there not some form of construction other than brick that will prove more reliable and efficient and that can be carried out at the same or even less cost?

That concrete can be advantageously used as a building material has been recognised for many centuries, and it has been found to have been used in many an ancient Roman structure; but from the earliest days it was realised that its economic use was limited to purposes where it was subject to compression stresses only, and it has only been through the invention and progressive genius of the engineer of the last generation or so that methods have been discovered by which to add to concrete the tensile strength that it lacks.

This tensile strength

has been given by embedding iron and steel in the concrete to take up those stresses which concrete by itself is not able to withstand.

"Reinforced concrete," as this combination of the two materials is generally called, has a practically unlimited field of usefulness. But while it is being used on all sides for fire-resisting and other structural purposes, its merits and usefulness in the construction of sewers, conduits, &c. (at least in this country), have so far received little attention. Many such works have been carried out in reinforced concrete construction on the Continent and in America, but only a few in this country; and the following general particulars may be of use to those who have such work in contemplation.

The Limit of Size.

Generally speaking, it is impracticable to cast and transport to any distance or handle pipes of a greater internal dimension one way than 4ft., although works have been carried out in which pipes of considerably larger dimension have been successfully cast and laid in position. It may therefore be accepted as a general axiom that it is more economical to construct pipes of 4ft. and upwards *in situ* on suitable temporary centering. Undoubtedly this form of construction is the more common and the more adaptable of the two; for not only is the difficulty of the joint eliminated, but depressions, bends, branches, &c., can be more easily provided for. In many instances also the material necessary to form the aggregate for concrete may be found in the locality, and in such cases the elimination of a large part of the cost of transportation is an added feature in favour of the work constructed *in situ*.

With work constructed *in situ* the questions of the form of centering, the cement, the aggregate, the reinforcement, the inside finish to the pipe and the carrying out of the work must all be carefully considered both from the engineer's and contractor's point of view, for the success of the work is just as important to the one as its cost is to the other.

Centering.

For works of small or medium value timber centering is generally used, but for large and expensive works sheet-iron or metal-sheathed timber moulds give better results, especially if it be intended that the face left on the concrete from the centering shall form the finished or wearing surface. The metal centering does not suck the moisture out of the concrete and, as there are fewer joints, a closer-grained and more impervious finish is obtained than is possible with wood. Wood is, moreover, less durable and requires more attention, and after it has been used a few times the cement adheres to its surface, so that when the wooden centering is struck the face work is likely to be pulled away in patches.

The vibrations and shocks to which the centering will be liable should not be lost sight of, nor the alternate soaking and drying action to which it will be subjected, and tests should be made before the commencement of work to see that the forms are strong enough for their intended purpose, and also that they can be removed without "jarring" the "green" concrete.

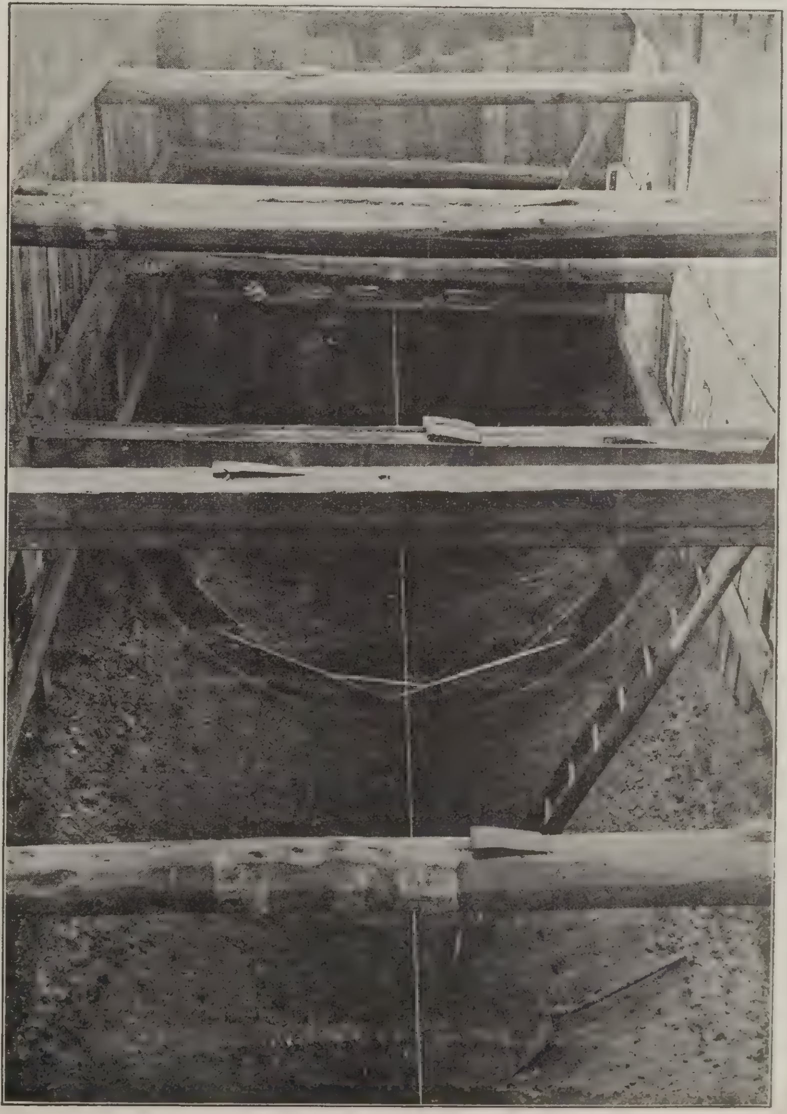

FIG. 1.—EXAMPLE OF EXCAVATION.

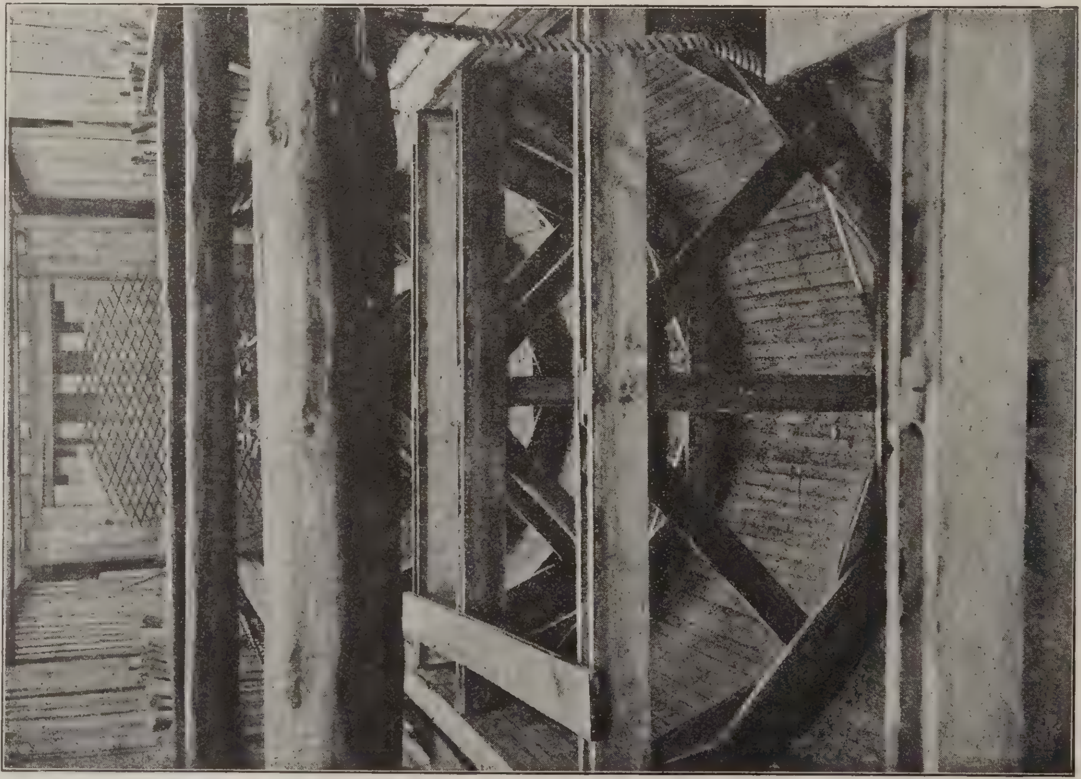

FIG. 2. EXAMPLE OF TIMBERING FOR INVERT.

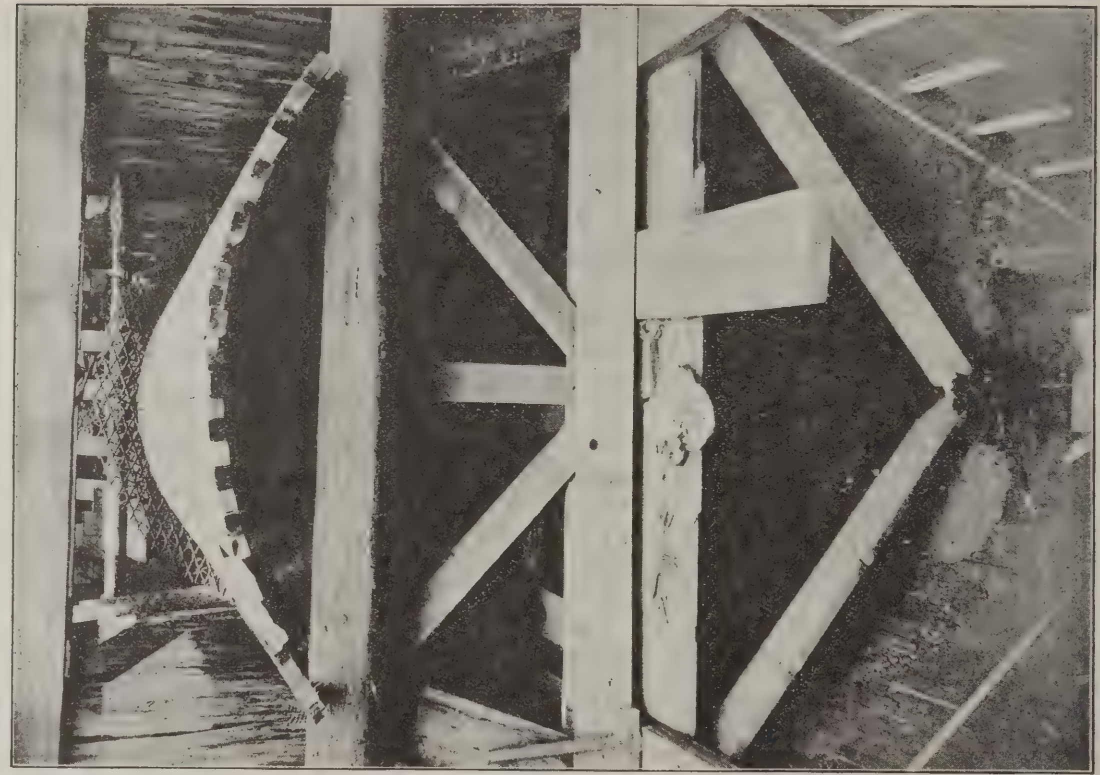

FIG. 3. EXAMPLE OF TIMBERING FOR CROWN.

Cement to Use.

The employment of good and suitable Portland cement is of the utmost importance. It should be finely ground and slow setting, and thoroughly cooled or air-slaked before use. The finer the cement the greater will be its value, while slow-setting cement—that which has its final set in seven or eight hours—is practically essential for use in reinforced concrete to allow of the separate deposits becoming thoroughly united. As special cements are now being manufactured for this class of work such brands should be chosen wherever possible.

Aggregate.

The aggregate must be carefully chosen. A hard natural aggregate should always be selected, and a porous one should never be used. As suggested above, a suitable aggregate may sometimes be found in the locality of the work, but cheapness is by no means the chief essential. A soft aggregate means a weak concrete, while a porous substance means a leaky job, and therefore a hard, impervious material is of vital necessity. It must be perfectly clean, its stones of an irregular nature and of a size not larger than will pass a 1-in. diameter ring; it should be free from all earthy matter, and if necessary it should be washed before use. The concrete must be made with the necessary proportion of clean sharp sand to prevent voids forming when the mixture is laid and tamped into position.

The Form of Reinforcement.

It is an open question which is the best form of reinforcement to use. There are many systems in vogue in various parts of the world, and examples could no doubt be quoted in which each has been successfully adopted, but a little consideration will settle the chief points to be decided.

The forms of reinforcement may practically be summed up under three heads—viz., a permanent sheet centering, rolled sections or rods in one form or another, and meshwork of various descriptions.

FIG. 6. KAHN BAR REINFORCEMENT.

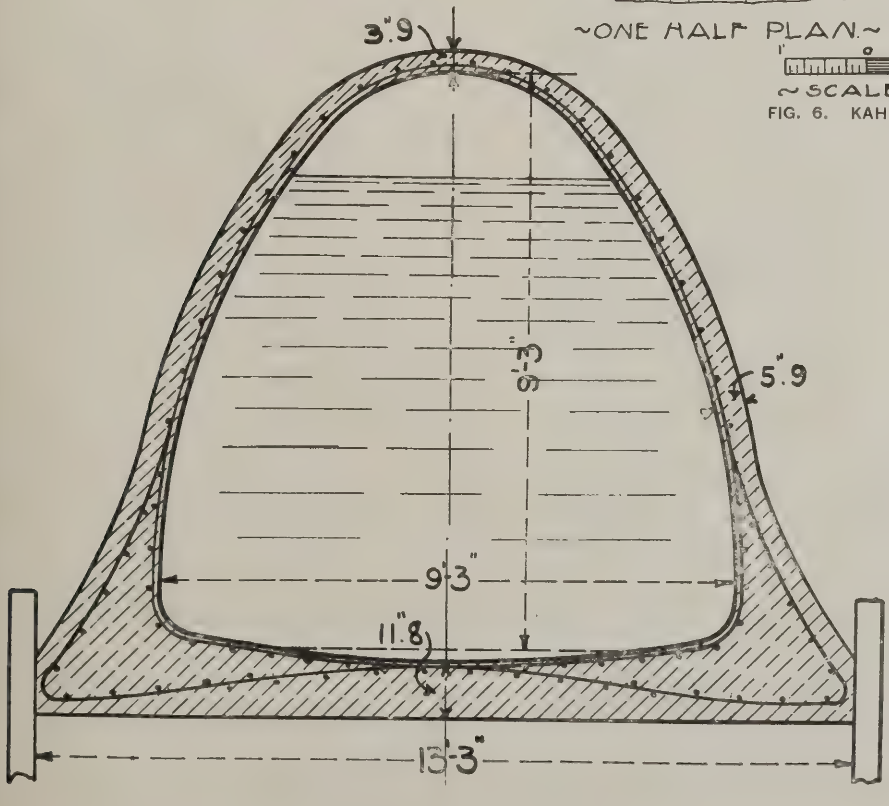

FIG. 4.—ROUND ROD REINFORCEMENT.

Now, it is obvious that a solid sheet of metal to act at the same time as a permanent centering and a lining to receive an inside finish is bad construction. There is no bond between the metal and the covering, and in the event of any settlement or temporary deformity the concrete and facing would burst away from the metal lining. The metal might not give way with the concrete, but without the protective coats the life of the pipe would be limited according to the amount of salts or acids in the water inside and in the surrounding material.

With regard to rolled sections and rods, longitudinal or circumferential reinforcement alone is insufficient. A combination of the two is necessary.

If meshwork be used, it should be diamond shaped and laid so that the diagonals of the mesh run over with, and the other at right angles to, the periphery of the pipe, in which way a reinforcement of helical members crossing each other is obtained.

Imperviousness to Water.

As it is of the first importance that sewers, conduits, &c., should be impervious to water in all cases, and sometimes that they should resist a considerable pressure, the inside finish or facing coat of the pipe must receive most careful attention. The concrete forming the main shell should not be depended upon for impermeability, for experience has shown that the tamping seams are to be feared, no matter how carefully fresh material may be added to that which has already been laid. Some experts assert that cement-concrete can be made watertight by the addition of a small percentage of lime, and others that trass is the material of the future for this purpose. Soap and alum, in proper proportions, added to the water to be used for mixing the concrete, have proved satisfactory in many instances, while in others a brick-lining has been introduced. The desired result can, however, be obtained by a lining of well-chosen cement and sand properly applied. Where such a finish is specified it should be applied immediately the centering is removed and while the concrete is yet "green." If this cannot be done, and the concrete is allowed to "go off," it should be freed from dust, &c., thoroughly wetted, and washed with grout as the application of the lining proceeds. The density of the finished work will depend to a great extent upon the amount of labour expended upon it, therefore the face should be worked up to a hard-polished finish from the steel trowel. A slow-setting cement should be used with fine sand, and too much rather than too little water.

For pressures of up to two and one half atmospheres a 1-in. facing of cement and sand, 1 to 2, laid in one body either on the centering immediately before the concrete or on the concrete after the removal of the forms, has proved effective.

For pressures of up to six atmospheres the facing should be laminated or put on in coats—the first coat of half to three-quarters of an inch of cement and sand, 1 to 2; the second of about a quarter of an inch, 1 to 1, trowelled to a hard polished surface, and a final wash of thick grout.

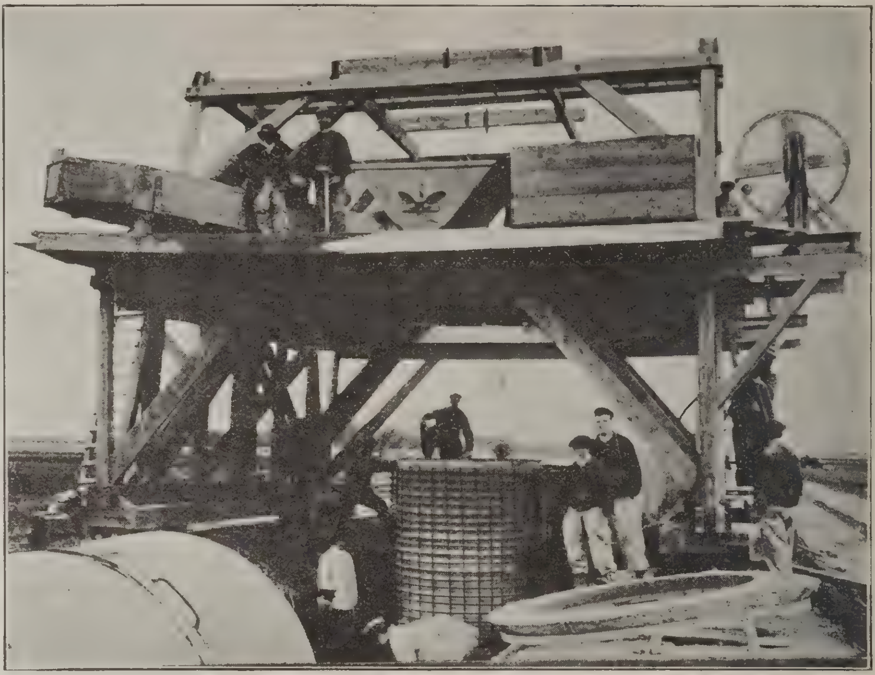

FIG. 7.—BONNA BAR REINFORCEMENT.

To Withstand Pressure.

It has yet to be proved that concrete pipes can be safely relied upon to resist heads of water exerting a pressure of more than six atmospheres, but though even a carefully-built pipe may be found to sweat a little at first, or even to crack slightly, owing to shrinkage or other causes, it invariably "takes up" with sediment and lime deposits from the water flowing through it, and thus in a short time becomes perfectly watertight.

The general arrangements for the carrying out of the work should be left to the contractor, but complete and careful supervision is necessary. The materials must be well chosen, properly prepared, frequently tested, and carefully put in place. The forms should be made in lengths convenient for handling and for the amount of work that will be done in a given time. The reinforcement should not only be laid, but it should also be fixed in position, so that there may be no possibility of its losing its correct position by the throwing and ramming into place of the concrete. Its members should be left protruding a few inches beyond each deposit of concrete to form a bond between that already laid and the fresh material; and to obtain a continuous reinforcement, rods, &c., should be overlapped and wired together, and meshwork should be overlapped at least one mesh.

Mixing the Concrete.

The concrete should be thoroughly mixed not less than twice dry and twice wet; and clean, fresh water should be used. Further, the concrete should be mixed as near as possible to the spot where it will be required, placed in position immediately it is mixed, not jarred after it has been laid in position, and protected from falling water and rain and excessive cold and heat.

The few typical sections shown in the illustrations will give some idea of how this form of construction can be adapted, but practically any requirements can be met. In all cases the position of the reinforcement in the concrete should be governed by the strains, pressures, &c., that the pipe is required to withstand. If it is to resist a head of water the tension member should be placed near the outer face of the concrete, while if the greater pressure will be exerted from the outside the section must be designed according to the nature of the soil in which it is to be built, most cases being met by placing the tension member eccentric in the concrete—running from near the underside of the invert to near the outside at half height, and thence to

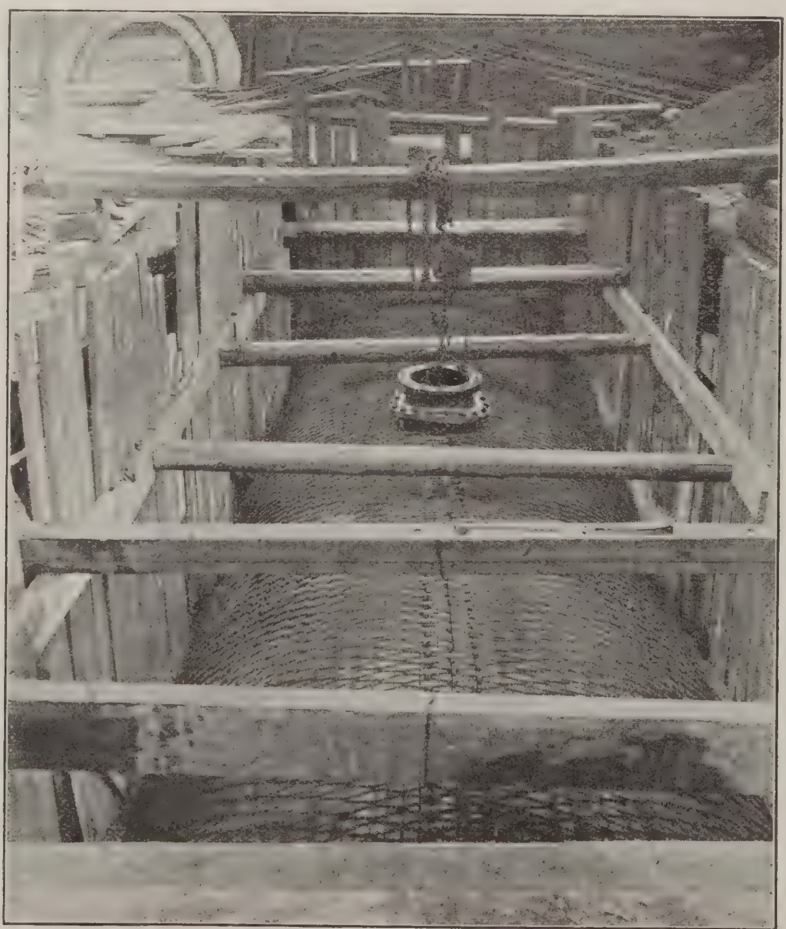

FIG. 8.—EXPANDED STEEL REINFORCEMENT.

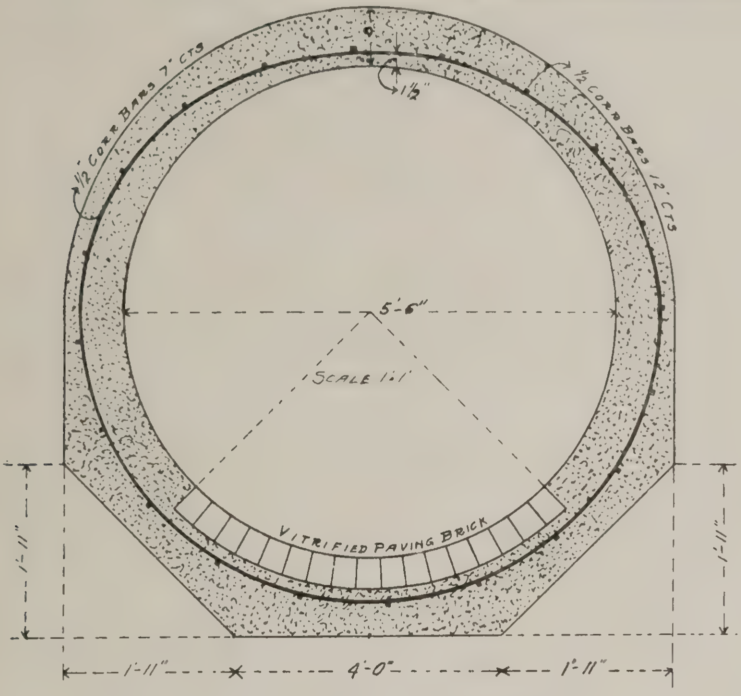

FIG. 5.—INDENTED BAR REINFORCEMENT.

near the underside of the crown. Where bad ground has to be dealt with a wide base section or a foundation raft should be used.

Calculations.

Lastly, with regard to the method for calculating the proportions — generally speaking the thickness of the concrete shell should in no place be less than one-twelfth of the greatest internal diameter of the tube, while the steel reinforcement should be designed to resist the whole of the tensile stress. Where the safe tensile stress in the steel is 8 tons per sq. in., $P =$ the pressure in lbs. per sq. in., and $r =$ the internal radius in inches, the weight of reinforcement per square foot $= \frac{Pr}{450}$, while its area at each side of the pipe per longitudinal foot, where $f =$ safe tensile stress in the reinforcement in lbs., $= 12\frac{Pr}{f}$.

WHAT CONSTITUTES REINFORCED CONCRETE?

The question which heads this article may seem to some persons superfluous, but there is considerable misunderstanding of the real nature of reinforced concrete among the architectural profession and the public generally. The misunderstanding probably arose from the fact that all the terms given to this combination of materials somewhat inadequately represent its true nature.

In France we find the term "ciment armé" in general adoption, and we have its English equivalent in "armoured concrete." These are, obviously, incorrect terms, because, in the first case, it is not cement, but concrete, that is used, and in both cases the concrete is not armoured, which would mean that it had metalwork applied on the outside, whereas just the opposite is the case, the metal being placed internally.

The term "ferro-concrete" has also been suggested, and used to some extent, but this simply means "iron concrete," and though it would be a perfectly legitimate expression for concrete cemented together by the use of iron filings, as a kind of rust cement, it is incorrect as a description of a combination of metal and concrete where each retains its original properties and bears its proportion of the stresses in a structure.

The term "concrete-steel" is used to a considerable extent in America, but this hybrid is obviously inexpressive—as inexpressive as "ferro-concrete."

We, ourselves, have adopted, as the best way out of the difficulty, the term "reinforced concrete," but this gives undue prominence to only one of the two materials, and it would be almost as inappropriate to say "reinforced steel."

The fact is, we want some short expression which shall mean "concrete combined with steel."

The terms "strengthened" or "stiffened" concrete would be plainly inferior to the term "reinforced concrete." The last tends to include too much. Under "reinforced concrete" would come half-timber construction, lath and plaster, wattle-and-dab, and, indeed, the form of construction adopted by the Romans where tiles were used to form permanent centerings for domes, vaults, and to face and bond walls.

Reinforced concrete work to-day is confined to metal (more generally steel) and concrete. We must be careful, however, not to give the term too narrow a limitation. Some specialists with particular systems seem to suggest that steel in reinforced concrete work must not be in any complicated form, but of the most simple and elementary sections framed and held together merely by the concrete. Such, however, is an unwarrantable assertion, because although it may be an argument in connection with their particular systems that there is little or no manufactured work to be done to the steel, it is too much to ask us to limit the whole subject to their way of thinking.

If we are to be limited in this way, where shall we place such systems as the Melan and Wünsch, the Bonna, the Columbian, the Kahn, even the Expanded Metal and the Roebling, and, indeed, the ordinary steel joist and concrete floor?

These are all legitimate developments of the primary principles of reinforced concrete work—*i.e.*, the use of concrete, firstly, to replace steel with a view to economy; secondly, to give stiffness and a more or less impervious surface, keeping out moisture and gases and preventing corrosion, such as in floors, walls, pipes, piles and other structures; thirdly, to protect the steel against the destructive influence of fire.

Reinforced concrete is the name we give to the combination which conforms to one or more of these conditions. While it fulfils the first function it more or less fulfils the others, and the first consideration has been pressed as the be all and end all of reinforced concrete. But if it were not for the economy of reinforced concrete over other methods of erecting structures, we should not find it so largely adopted. Final economy may be found in the resistance to corrosion and safeguarding against fire, but it is more generally due to the economy in the direction of the much smaller cost of the materials and labour necessary in making the concrete used in a structure as compared with the steel bulk for bulk. Concrete is, however, deficient in resistance to tensile stresses. It has a certain amount of resistance, and, of course, can be, and is, used alone, but the use of a sufficient quantity of steel to make up for a certain amount of its deficiency in this respect enables the concrete to be reduced in quantity, and perhaps in the quality, of the ingredients of which it is composed. Steel will allow reduction in the amount of concrete, but if the concrete is reduced too far, then the steel has to be increased proportionately.

The point to be determined is where the greatest economy is obtained. It matters not how much work we put into the manufacture and manipulation of the steel reinforcement if economy results therefrom. For instance, it may be preferable to make the steel structure self-sustaining, so as to be able to place it in a position as a whole upon the centering without becoming distorted by being lifted into position or by the deposit of the concrete around it. Economy may also result from making the frameworks beforehand in such a manner that it may be possible to transport them to the site where the concreting and the moulding is to take place. It is a well-known fact that this is commonly done in the case of pipes, and there might be an advantage in proceeding in the same manner with piles. Such would, of course, necessitate frameworks having a certain rigidity.

Again, it may be found economical to save space by reducing the amount of the concrete by using an increased amount of steel. Economy may come from using an additional amount of steel, or by so forming the reinforcement, that parts of construction such as pillars or piles may be manufactured away from the position in which they will be finally placed, and be able to be transported and lifted in a horizontal position without being damaged by assuming a position not their eventual one. Also in connection with pipes, whereas they may not be subjected to flexure when placed on a solid foundation, yet it may be desirable to give them extra stiffness, so that they can be lifted by means of cranes, &c.

Again, in arches and chimneys it is convenient and economical to use special sections, such as tees and angles, and to rivet the reinforcement together (for instance, the Melan arch). Indeed, in beams we are beginning to recognise the advisability of rigid attachment of the shear members to the bottom reinforcement, and it may be desirable to rigidly connect the

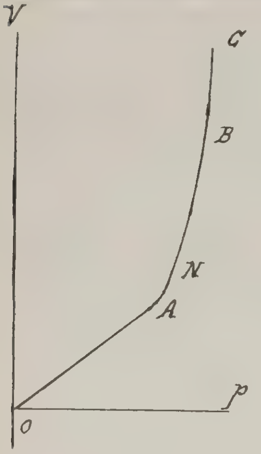

FIG. 1.

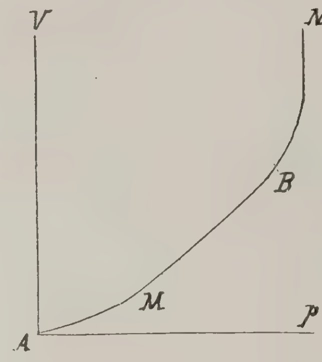

FIG. 2.

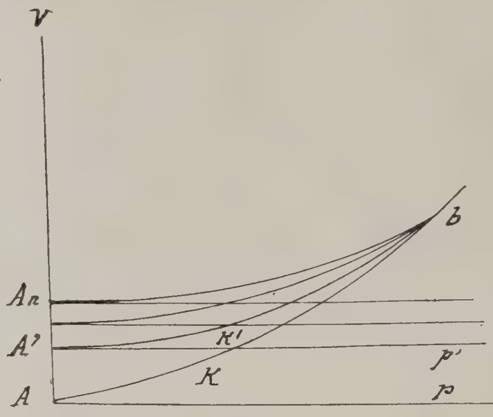

FIG. 3.

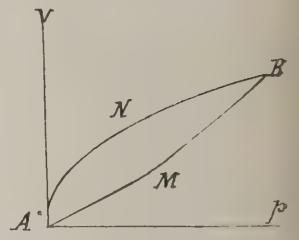

FIG. 4.

top reinforcement as well. In bridge construction we find large trusses constructed of reinforced concrete and the points of juncture between the members riveted.

It is advisable generally to continue to use sections of steel which are regularly manufactured and to be obtained cheaply, but as we have said above, circumstances may make it desirable to avail oneself of steel sections other than the ordinary, and to put extra labour into the construction of the reinforcements. In short, it does not matter what means and methods we adopt so long as concrete and steel are used together for their mutual advantage to obtain efficiency with economy in the final result, and such means and methods may be termed "reinforced concrete," "ferro-concrete," "armoured concrete," "concrete-steel," or any other term that expresses the same association of the two materials in structures.

STRAINS IN REINFORCED CONCRETE SUBJECTED TO FLEXURE.

By N. de Tedesco, Ingénieur des Arts et Manufactures, Rédacteur en Chef du "Le Ciment."

Various theories have been advanced regarding the stresses carried by reinforced concrete constructions subjected to flexure. The basis of these theories is, of course, intended to be the experimental researches upon the mechanical properties of concrete and steel. Unfortunately such researches are not easily carried out, because the strength and the elastic behaviour of concrete are influenced by many conditions—namely, the quality of the ingredients and their proportions, the quantity of water used in mixing them, the climatic conditions during the process of hardening, and many other circumstances. Nevertheless M. Souleyre, Ingénieur des Ponts et Chaussées, and M. Anglade, Conducteur des Ponts et Chaussées, both resident in Constantine, Algeria, have shewn (the first named in France in 1894) that the general laws of resistance found for iron and steel may be applied to some extent to stony materials.

The general laws referred to are well known. The materials used by builders are not perfectly elastic. When the load is gradually increasing, the material is to be considered elastic only during a first period; in a second period preceding rupture it appears as ductile, a portion of the lengthening or shortening subsisting after the load has been removed. The curve of deformation corresponding to increasing loads is illustrated on Fig. 1. The first portion OAN may be divided itself into two parts OA, nearly a straight line (period of proportionality), and AN preceding the period of ductility and large deformations.

The curve obtained by MM. Souleyre and Anglade for cement mortar under compression (Fig. 2) agrees rather well with Fig. 1; it shows that the functions between the periods are more marked. The mortar used was mixed in the proportion of 835lbs. of cement per cubic yard of sand.

These engineers state that in the neighbourhood of rupture the straight line MB is abruptly altered into a line BN which tends to become parallel to the axis AV. This sudden increase in the deformation corresponds to the stricture in an elongated bar—namely, to the sudden decrease in the sectional area.

The portion BN of the curve of compression was only to be observed with mortar and soft woods. With the hard stones, the point B is too near rupture to allow the deformations BN to be observed. Breaking occurs abruptly, and it can be said that for stony materials the portion BN is to be considered practically as *nil*. In metals the period BN may very likely exist for compression as well as for extension.

In mortars the point B corresponds to a ratio of the breaking load, which is estimated at from one-third to four-fifths according to the age, the nature and the hardening process.

This point B is very important; it is in its neighbourhood that the deformations cease to be proportional to the stresses, and permanent set becomes considerable. The point B is also the limit at which repeated loading produces deformations increasing indefinitely until rupture occurs. The effect of this repetition of loads may be described as follows, so long as the ultimate stress does not attain the point B (Fig. 3): When the stress has reached the point *b* which is within the curved portion AM of the line of compression, the permanent set is AA'. If we now load the specimen again the curve of deformation is plotted with the stresses as ordinates starting from the line $A'p'$ parallel to Ap. For the stresses increasing till the first limiting stress be attained, the compression line $A'K'b$ will differ from AKb, but in the neighbourhood of the point *b*, the two curves will tend to coincide. If the unloading and re-loading are repeated several times it may be stated that:—

(1) The point A tends to assume a position A_n as a limit.

(2) The various curves tend to coincide at the point *b*.

(3) Starting from point *b*, the curve of deformation would have been nearly the same as in the first experiment, if the stress had attained the point *b*.

For mortar the repetition of loads tends to transform the curved lines into straight lines, if the point *b* does not reach B, but when the limit of elasticity is exceeded, the compression lines obtained in loading tend to coincide with those obtained on removal of the loads. These curves are illustrated for the first experiment in Fig. 4. AMB is the curve of increasing and ANB the curve of decreasing loads. These two lines differ principally in the neighbourhood of origin. If the pressure attains a point B corresponding to the limit of elasticity, the two curves very nearly approach an intermediate straight line drawn through the point of their greatest extension.

MM. Souleyre and Anglade found from experiments three months after moulding on cubes of about 6ins. average limits of elasticity of about 1,280lbs. per sq. in.—that is, about 62 per cent. of the ultimate strength. The average moduli of elasticity were found equal to about $1{\cdot}76$, $2{\cdot}37$ and $2{\cdot}87 \times 10^6$ lbs. per sq. in.

The Souleyre and Anglade curve has been confirmed by the very accurate experiments of Professor Bach on cylindrical pillars, 1 metre long (about 3ft. 3½ins.) and about 10ins. in diameter. The results of these researches allowed even a mathematical expression of the general relation between the unit pressure σ and the deformation per unit of length e of whatever material—namely, $e = \frac{1}{E}\sigma^m$; E being the modulus of elasticity of this material, and m a coefficient varying for concrete with the quality of cement, the nature of ingredients and the proportions of the mixture. This formula has been translated into Imperial measures by Mr. Charles F. Marsh in his treatise "Reinforced Concrete," and applied to various mixtures and pressures; some curves he obtained in plotting the value of E for stresses from 100lbs. to 1,000lbs. per sq. in. are illustrated in Fig. 5. It can be seen that the coefficient of elasticity from 100lbs. to 1,000lbs. pressure decreases less and less rapidly. From 100lbs. to 200lbs. pressure the average value of E is $3{\cdot}15 \times 10^6$; the decreasing pressure, 3×10^5, corresponds to 9·55 per cent. per 100lbs. of increasing pressure. From 200lbs. to 400lbs. pressure the average value of $E = 2{\cdot}85 \times 10^6$; the decreasing pressure being 3×10^5, or 5·25 per cent. per 100lbs. of increasing pressure. From 400lbs. to 800lbs. the average value of $E = 2{\cdot}575 \times 10^6$

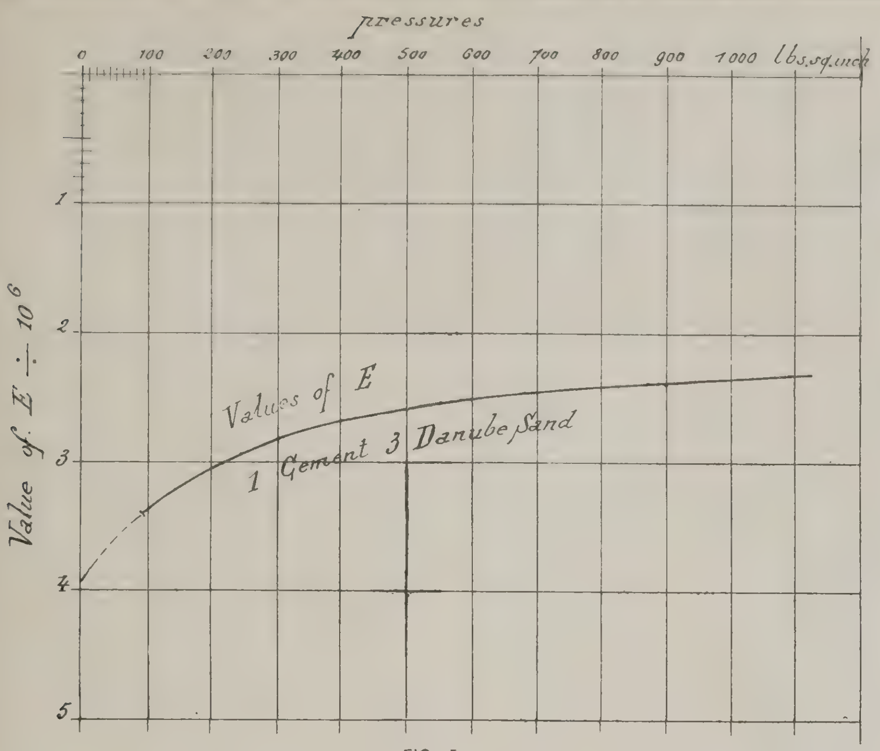

FIG. 5.

the decreasing pressure being $2{\cdot}5\times10^5$, or 2·43 per cent. per 100lbs. of increasing pressure. We may say, moreover, that the pressures allowed in designing being of about 600lbs., corresponding here to $E=2{\cdot}5\times10^6$, the most important variation from 100lbs. to 600lbs. pressure is to be considered as equal to $0{\cdot}7\times10^6$—that is, equal to 28 per cent.

Let us investigate further the influence of the value of the modulus E on the stresses carried by a reinforced concrete member, taking a slab for example. Let p = the percentage of the extended reinforcement, n = the ratio between the modulus of elasticity of steel E_s and the modulus of concrete E_c. As E_s is constant, n is inversely proportional to E_c. The depth and the breadth of the slab is assumed to be 1in. The depth is intended to be measured from the axis of the reinforcement to the ultimate compressed fibre. This slab is designed for a bending moment of 100 foot-lbs. per foot, or inch-lbs. per inch. Let $p = {\cdot}007$ (or ·7 per cent.) x and $1-x$ = the distances from the neutral axis to the centre of the reinforcement and to the ultimate compressed fibre respectively. M = bending moment, r_c the ultimate unit compressive stress of the concrete, and R_s the unit tensile stress of the steel.

The three equations for the calculation of a slab are:

$$(1)\ x=1+np-\sqrt{(1+np)^2-1}$$

$$(2)\ M=r_c\left[\frac{(1-x)^2}{3}+np\frac{x^2}{1-x}\right]$$

$$(3)\ R_s=nr_c\times\frac{x}{1-x}$$

Applying these equations to the data given above and successively to $n=10$, 15 and 20, we get:

When $n=10$

$$x=1+10\times.007-\sqrt{1{,}070^2-1}=.688$$

$$1-x=.312$$

$$M=r_c\left[.033+.07\times\frac{.688^2}{.312}\right]=r_c\,[.033+.106]$$

$$=r_c\times.139=100$$

$$r_c=\frac{100}{.139}=720\text{lbs. sq. in.}$$

$$R_s=720\times10\times\frac{.688}{.312}=15850\text{lbs. sq. in.}$$

When $n=15$

$$x=1+15\times.007-\sqrt{1.105^2-1}=.635$$

$$1-x=.365$$

$$M=r_c\left[.044+.105\times\frac{.635^2}{.365}\right]=$$

$$r_c\,[.044+.116]=r_c\times.160=100$$

$$r_c=\frac{100}{.160}=625\text{ lbs. sq. in.}$$

$$R_s=625\times15\times\frac{.635}{.365}=16{,}300\text{lbs. sq. in.}$$

When $n=20$

$$x=1+20\times.007-\sqrt{1{\cdot}14^2-1}=.592$$

$$1-x=.408$$

$$M=r_c\left[.055+.14\times\frac{.592^2}{.408}\right]=$$

$$r_c\,[.055+.120]=r_c\times.175=100$$

$$r_c=\frac{100}{.175}=571\text{lbs. sq. in.}$$

$$R_s=571\times20\times\frac{.592}{.408}=16{,}560\text{lbs. sq. in.}$$

As a result of decreasing the value of E_c (or increasing n), we observe that

x and r_c decrease with the value of E_c
R_s increases ,, ,, ,, ,, ,,

These deductions are recapitulated in the following table:—

Value of n.	x	Moments of resistance.			Maximum Stresses.		Decrease of Stress in Concrete.	Increase of Stress in Steel.
		Concrete.	Steel.	Total.	Concrete.	Steel.		
10	·688	23·80	76·50	100·30	720	15,850	95 $\frac{95}{625}$ = 15·2p. c.	450 $\frac{450}{16300}$ = 2·76 p. c.
15	·635	27·50	72·50	100	625	16,300	54 $\frac{54}{625}$ = 8·69 p. c.	260 $\frac{260}{16300}$ = 1·6 p. c.
20	·592	31·40	68·50	99·90	571	16,560		
1	2	3	4	5	6	7		

It is to be noted that the proportion of the bending moment supported by concrete increases with n, and that the proportion supported by the steel decreases (see columns 3 and 4).

It should be noted also that if we wish to attain simultaneously 635 and 16,600lbs. for the maximum stresses in concrete and steel respectively, the formula expressed in Imperial measures is very handy. Let h be the depth in inches of the slab, from the compressed face to the centres of the reinforcement bars; we have:

$$h=\sqrt{\frac{M}{100}}$$

and the percentage of steel will be ·7 per cent. of h, or ·084 h per foot in square inches. The total depth of the slab will be $h+1$in.

Then if E_c is asumed to be constant and the stress-strain curve to be a straight line, an error of 28 per cent. in the value of E_c would correspond at most in the concrete to $\cdot28\times\cdot152=\cdot0425$ or 4·25 per cent., and in steel to $\cdot28\times\cdot0276=\cdot0079$ or ·7 per cent. The value of these errors not being of any importance, the assumption of a straight line for the stress-strain curve is most practical and suitable.

It seems now quite useless to inquire into the influence of the value of E on the real position of the neutral axis and on the values of stresses carried by compressed concrete or extended steel, as we should find differences of the same insignificant order, and especially as the latest tendency is to consider the strength of extended concrete as nil. Of course, the effect of the variability of E upon the deformation is of first importance, but fortunately for engineers the solution of this problem is not required. They have already enough trouble in economically designing buildings in conformity with the allowable stresses, and it can be said that rapidity of calculation is for reinforced concrete constructions a question of "to be or not to be."

REINFORCED CONCRETE SYSTEMS.

V.—The Johnson Indented Steel Bar.

In this article we deal with one of the foremost systems of reinforced concrete construction in the United States—a system which has been recently introduced into this country. It is six or seven years since Mr. A. L. Johnson, M.Am.Soc.C.E., invented this form of bar, rolled so as to give mechanical bond between the reinforcing metal and the concrete. The bar is known in America as the Johnson "corrugated" bar, from the fact that it was at first rolled with corrugations upon the four faces of a square bar, which latter formed the minimum section. As, of course, the strength of a bar is the strength of its weakest part, these corrugations meant an increased quantity of metal, added for the sole purpose of mechanical bond. A new section of bar, however, was arrived at later, and this bar is the one which is being manufactured in this country and termed the "Indented" steel bar. In this not only is mechanical bond secured, but the bar has

a uniform section throughout

the form being as shown in Fig. 4, which, it will be seen, consists of an alternated oblong section.

The firm manufacturing these bars in the United States is known as the Expanded Metal and Corrugated Bar Co. of St.

Louis. This company was at first one of the several companies manufacturing and using "expanded metal," and **Mr. A. L. Johnson** was its consulting engineer. It was in consequence of his being engaged in the design, construction, and supervision of reinforced concrete work for the company that he was led to invent this particular form of reinforcing bar.

In order to understand the advantages which the bar offers in reinforced concrete work it is necessary to go into the theory of the subject, for the many points in its favour are not exactly obvious upon inspection, and though tests have shown the superiority of indented bars we all like to know the reason why. Firstly, we may draw attention to the importance of **adhesion** between the concrete and the reinforcing steel rods or bars. The adherence of concrete to steel has been variously estimated at from 200lbs. to 700lbs. per sq. in. by various investigators and engineers, but Considère assumed the value to be 250lbs. to 500lbs. per sq. in., and generally upon his statement it has been customary on the Continent to assume as a safe working stress 50lbs. per sq. in. It has been shown, however, by later experiments, that the adhesion of concrete to steel was a very questionable item in reinforced concrete work. For instance, Breuillé, in 1902 carried out experiments which showed that immersion of the concrete in water for nine months **reduced the adhesion** by one-half to two-thirds. It is obvious also that if the rods get coated with oil, paint or similar substance the adhesion will be entirely destroyed. Again, it is easy to see, as Professor Schule, of Zurich, demonstrated in 1904, that when the bars are under stress their cross-section is slightly reduced, and this reduction must materially affect the adhesion, which simply consists in the entering of the concrete into the microscopic pores on the surface of the metal (for this reason it is generally recommended to leave the mill scale and rust upon the rods). Vibration, again, will undoubtedly cause the adhesion to be still further reduced in course of time. Finally, it is obvious that a bar, of a diameter **such as is used in practice,** of, say, 1in. or 1¼in., will require to be embedded or anchored a considerable distance in the concrete in order that the adhesion reckoned as so many pounds to the square inch of the surface of the bar may be equal to the stress desired to be developed in the bar. For instance, supposing we have a round rod of 1 sq. in. section, the surface will be approximately 3½ sq. ins. per inch run. Assuming adhesion of 50lbs. per sq. in., in order to develop a stress of 16,000 lbs., say, in the steel, it is obvious that the bar would have to be embedded in concrete a distance of

$$\frac{16,000}{50\times3\frac{1}{2}}=\frac{640}{7}=91\text{ins.}=7\text{ft. }7\text{ins.}$$

In the majority of cases, of course, such a distance could not be allowed, and in practice there is little or no factor of safety in regard to adhesion. The adhesion which is given by a mechanical bond in the bar is of the **utmost importance in the shear members,** because their short length — namely, the depth of the beam — is obviously too little to enable the required strength to be developed in the short distance available. It is only to be expected that instances should arise where the adhesion has been found insufficient after some years' service. In the United States, where reinforced concrete beams have been constructed for a good many years, such weaknesses have made themselves apparent. It is almost certain that the same will be found on the Continent. Indeed, it seems that these facts are admitted, because the German official regulations state **the advisability of mechanical bond** between the concrete and the metal.

Such mechanical bond has been given to bars in various ways, among which may be mentioned twisting. It is obvious that the resistance of the latter is greater than that of the plain rod, but only in proportion to the slightly greater length of the screw line to the axial length. With projections on the bar, however, the resistance is greatly increased, and not, as might be supposed, merely to the extent of the shearing resistance of the concrete embedded between projections, for the projections of the bar form the tops of cones of resisting stress which gradually widen out into the concrete from these points.

There is a tendency with projections upon a bar, unless they exceed the angle of friction between concrete and steel, to split the concrete. The indented bar patents, however, cover all bars that can be rolled which will fulfil this condition.

It will no doubt appeal to English engineers as a reasonable precaution, in view of such wide variations as may occur in the adhesion of concrete to steel, to be able to rely upon some more certain bond, and this the indented bar offers.

The indentations or projections of this bar serve **a further purpose,** however, which is, if anything, of hardly less importance than the foregoing. Considère, as a result of his first experiments, concluded that concrete reinforced with steel would stretch much beyond what it would when unreinforced. This was subjected to criticism, and he repeated his experiments, and, although he came to the same conclusion as before, the experiments were far less conclusive than at first. Prof. F. E. Turneaure, of the University of Wisconsin, recently made a series of careful tests on reinforced concrete beams, which seem to prove without much opportunity for doubt that Considère, as one would have supposed from theory and common-sense, was wrong. Prof. Turneaure tested beams upside down which had been kept under water until tested, and he observed that at certain points lines of moisture made their appearance.

These lines he marked with chalk, and although a magnifying glass did not reveal cracks, when portions were cut out between chalk marks and containing chalk marks after the loads on the beams had been removed, those containing chalk marks fell apart at the marks, whereas the others did not and when tested were found uninjured by flexure. It was obvious from this that concrete does crack when it reaches its elastic limit. The metal reinforcement has, however, undoubtedly the tendency of distributing the extension fairly uniformly along the length of the beam, and enabling each portion of the concrete to take its maximum elongation. But once cracks are developed they become extended more and more under increase of load, and it is possible to obtain with a considerable deflection large cracks which expose the reinforcement to corrosion. The indented bar, however, will ensure a very large number of fine cracks (so fine that there is no fear of corrosion) instead of a smaller number of large ones.

The indented bar is made of **high elastic limit steel,** the argument in favour of this being that, beyond the elastic limit, the stretching goes on increasing under repeated loading without recovery after removal of loads, and, consequently, the cracks in the concrete gradually widen as the deflection increases until the structure fails. There is no doubt that the use of ordinary factors of safety is very unscientific, and the Patent Indented Steel Bar Co., Ltd., press the point that the factor of safety for reinforced concrete construction should be based on the capacity of the structure at the elastic limit of the metal reinforcement. This factor of safety should, in their opinion, be generally not less than 4. As most of our readers are probably aware, it is usual to allow a working stress in steel of about 16,000lbs. per sq. in. As mild steel has an elastic limit of about 30,000lbs. per sq. in., there is really a factor of safety of less than 2, although the working stress is one-quarter of the ultimate strength—namely, 64,000lbs. per sq. in. Now, not only is the ultimate strength of high elastic limit steel considerably higher, but the elastic limit is 55,000lbs.

With an elastic limit of about 30,000lbs. per sq. in. the economical quantity of metal reinforcement is 1·4% of the area of the concrete upon a factor of safety of about 4, but with an elastic limit of 55,000lbs. the actual percentage becomes ·7. Thus it will be seen there is a saving of 50% in the amount of metal required effected by the use of higher limit steel.

The only objection to the use of high carbon steel we have heard made is that some engineers think that the advantages due to the additional strength so obtained are to some extent offset by the loss in ductility. The rolling mills manufacturing the bars have to work to a specification which prevents brittleness. The elongation in 8ins. of the material is from 15 to 17 per cent., which shows that the bars have considerable ductility. The indented bar can be rolled of any grade of steel desired.

Such are briefly the chief points connected with the bar, and they are applicable to any theory of calculation. The theory and practice of the patentees, naturally, is compiled to take the greatest advantage of all the favourable points of the bar. We realise when we closely investigate the subject how the indented bar results in much economy, and in fulfilling almost all conditions with a refreshing directness. The engineers to the manufacturers of the indented bar are some of the foremost experts on the subject of reinforced concrete, and the recent catalogue which has been published by the company forms one of the best treatises on the subject. Every praise is due to the company for the manner in which it places all the facts before the architectural and engineering professions without endeavouring to mystify anyone in the slightest degree. The company seems determined to state the whole facts and trust to the commonsense of the public to appreciate the advantages.

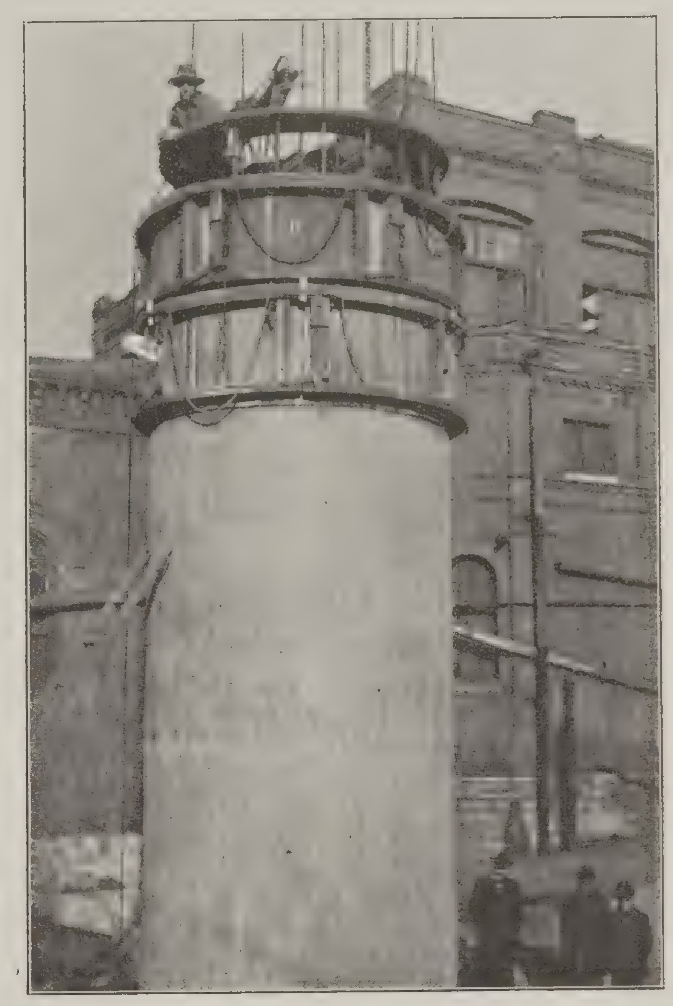

FIG. 9. CHIMNEY IN COURSE OF CONSTRUCTION FOR THE ST. LOUIS BREWING ASSOCIATION.

Standard Sizes of Indented Bars.

The following table gives the standard sizes in which indented steel bars are manufactured:—

Size (ins.)	Nett Section (sq. ins.)	Weight per lineal foot (lbs.)	Size (ins.)	Nett Section (sq. ins.)	Weight per lineal foot (lbs.)
1/4	·06	·24	3/4	·56	1·91
3/8	·11	·38	7/8	·77	2·60
1/2	·25	·85	1	1·00	3·40
5/8	·39	1·33	1¼	1·56	5·31

These bars are supplied by the company at standard prices per ton, which amounts cover any cost they may be put to in the preparation of designs and submitting estimates. There are no royalties to pay with this system. Any architect or engineer, if he chooses, can design the work himself, or the company's engineers will prepare details, making all necessary calculations, and they will give a quotation for the supply of the bars. The actual work of construction can be tendered for by contractors upon the plans and quantities.

The theory for the design of beams embodied in the company's catalogue includes the latest reasoning and the results of the latest investigation on the subject of reinforced concrete, and we therefore reprint diagrams which will show the chief points.

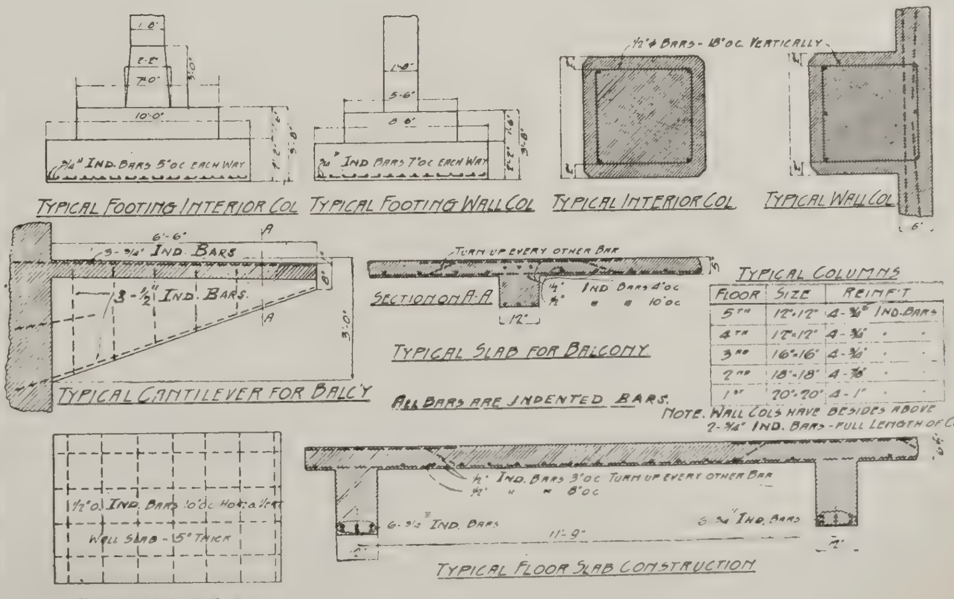

FIG. 6. TYPICAL WAREHOUSE DETAILS.

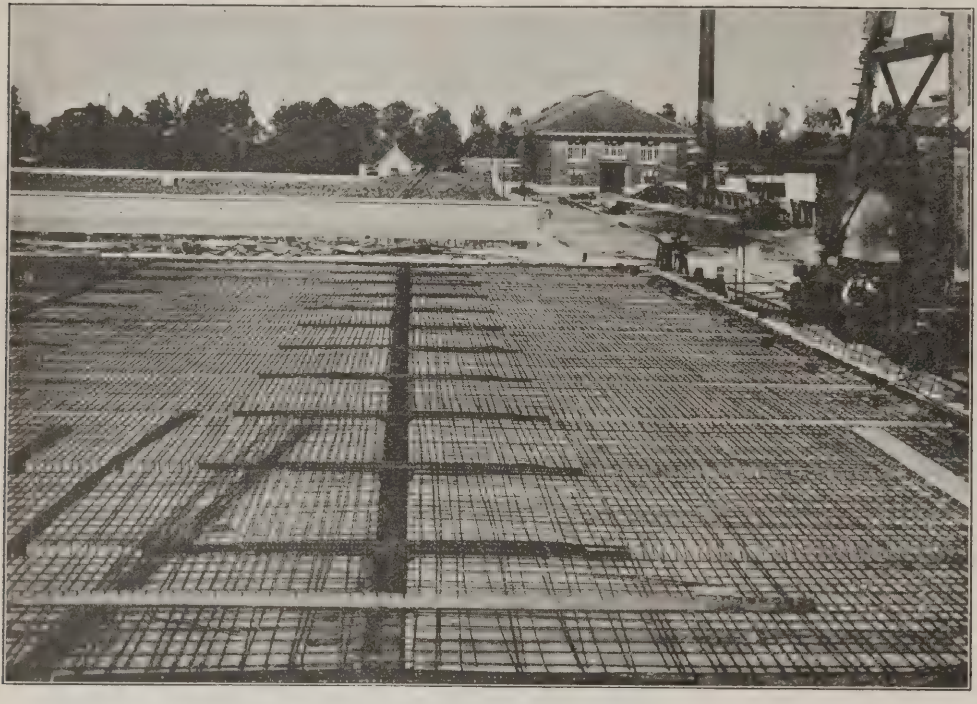

FIG. 7.—TOP OF RESERVOIR UNDER CONSTRUCTION FOR THE INDIANAPOLIS WATER CO.

Firstly, it is assumed that plane sections remain plane after bending, and although this is not absolutely correct, it is near enough for practical purposes, and makes the analysis clearer. Fig. 1 shows a cross-section of a beam, fig. 2 the strain or deformation diagram, and fig 3 the stress-strain diagram. Now, the company's engineers, in addition to their advocacy of other reforms, insist upon the importance of designing structural members for the ultimate loading, and not inserting safe values in the formulæ, which render it impossible to tell what real factor of safety is obtained. Thus, they design a beam to sustain as its ultimate breaking strength four times as great a load as is estimated to be sustained. In consequence of this they rightly take the stress-strain curve of the concrete in compression not as a straight line, but as a parabola. Instead of

the vertex of this parabola,

however, being put at the top of the beam, where Prof. Talbot places it, the modulus at rupture is taken at two-thirds of the initial modulus of elasticity, and in consequence the vertex of the parabola rises above the top of the beam. This is shown in Fig. 3, where the initial modulus, if not reduced, would cause the stress-strain curve to be a straight line, but the reduction of the initial modulus brings the curve to the position of the shaded area shown, f_c being the greatest compressive strength of the concrete and c' the abscissa at the vertex of the parabola. It seems to be pretty generally recognised now that the modulus of elasticity of concrete decreases as the stress increases, and the assumption of the modulus at rupture being two-thirds the initial modulus is the result of the examination of the results of a number of tests on full-sized beams.

In the discussion the stress taken by the concrete in tension is also considered. f_t is the modulus of concrete in tension at rupture; that is to say, the tension is limited to the shaded portion in Fig. 3 by reason of the stress below this point having exceeded the strength which the concrete would bear. It may be well to state here that at ultimate loading the effect of the tension in the concrete is negligable.

The analysis of the stress and deformation in a beam are somewhat intricate and need not be repeated here, but as a result of a very complete discussion simple formulas are arrived at to serve for the purposes of practical designing. The following constants used by this company for different kinds of concrete as the result of experiments are interesting:

Kind and Proportions of Concrete.	Crushing Strength (lbs. sq. in.)	Modulus of Elasticity
Average Rock Concrete 1 : 3 : 6	2,000	2,600,000
Good Rock Concrete 1 : 2 : 5	2,700	2,800,000

The greatest elongation the concrete will take in tension before rupture is the same for both concretes—namely, ·00015.

The analysis which the company gives in its catalogue for the stresses in

T-beams

is particularly interesting. For the first time, so far as we are aware, the width of the table of the **T** is calculated. This width is usually assumed in calculations, but it is shown that the amount of compression that can be calculated as taken by this portion of a **T**-beam is dependent upon the resistance to shear of the concrete at the junction of the rib with the table. As all the compression in the table is put into it by shear along the plane of junction, it is evident that the total compression cannot be greater than the shearing strength of the concrete along this plane.

The shear stresses

in beams are also dealt with in the catalogue in a careful manner, and we may mention here that the practice in providing against shear stresses in beams constructed with indented steel bars is to turn up the bars one after the other as the supports are approached, the distances apart of these vertical reinforcements being gradually lessened towards the points of support. Bars can be turned up in this manner as the bending moment gets less towards the supports, and consequently a smaller amount of metal is required. Of course the ends of the bars being thus turned up means that a rigid attachment of the shear members to the bars is obtained.

It now only remains for us to deal with various adaptations of these bars in practice. Fig. 6 shows a typical floor construction, as also pillars, foundations, and cantilevers constructed with indented steel bars, these being details of the typical construction of a warehouse as shown in Fig. 5. to which many large structures have been designed and erected in the United States with these bars.

Floors.

Fig. 7 shows a floor in course of construction, while Fig. 8 shows the manner in which concrete floors are economically reinforced with indented steel bars in a steel-frame construction, such as is customary in the United States for large buildings, and is now coming into general adoption in this country. The main beams, of course, in a steel-frame structure are of I section, and the indented bars are just hooked over these beams as shown in the view. It is usually considered sufficient to run these bars in one direction only, although with heavy concentrated loads bars of smaller section are placed crossing them in the opposite direction so as to prevent cracks occurring along the lines of the principal bars.

Fig. 9 also shows a job where indented bars were used for the construction of a reinforced concrete chimney stack 125ft. high.

In this same issue we publish a section showing the manner in which indented bars are used to reinforce sewers, this section being taken from an actually constructed conduit at Del Rio, Texas. In addition to the above-mentioned uses to which indented bars have been put, we may mention bridges, culverts, tunnels, canals, reservoirs, gasholder tanks, water towers, sea walls, grain bins, dams and retaining walls.

In the United States these indented bars have been most extensively used for engineering work—a fact which should be conclusive to the uninitiated that these bars possess real advantages, for the engineering profession in America is highly trained and scientific. We have not space to publish illustrations of even the most important and interesting architectural and engineering structures erected with indented bars.

The Weird in Architecture. In view of some latter-day expressions—more especially those connected with the arts and crafts movement—it is interesting to consider the subject of weirdness in architecture; and, at the outset, it may be well to distinguish between what is "weird" and what is "mysterious." Ruskin was a noble exponent of the mystery of architecture, and, though it has now become the fashion to discredit him as a critic, we cannot forget many wonderful passages in his writings which bring vividly before us this quality of architecture. There is, however, a vast difference between "mystery," as we think of it in great cathedral building, and "weirdness," as we now contemplate it in the work of ultra-moderns. This "weirdness" is no thing to foster, but a thing to be stamped out. It is the expression of a mad type of mind, and of all qualities in architecture we do not want madness: for architecture demands restraint, and though it is legitimate to give play to all manner of quaint "fancy," there must be a ruling sense of control—the subordination of matter to mind. We are not imagining a wild flight of design, as though it did not exist. Unfortunately, we have only to turn to buildings without number now being produced by a certain type of architect on the Continent to see what amazing things are done. The Arts and Crafts movement sprang out of this country, but the several leading men who were (and still are) the life and soul of that movement here must not be saddled with the wild creations of unbalanced intellects abroad. In particular, we cite some of the German and Austrian work. We took occasion in a former issue to illustrate a few of the maddest freaks which we had then encountered—material treated absolutely without regard to fitness, and utter license taken with recognised forms, so that the effect was nothing else than ridiculous. At the same time we think it ought to be pointed out that amidst all this weirdness of design there is much that is really notable—brilliant ideas of fresh forms and new detail which are worthy of the closest attention; for, in a sense, this is the product of genius, and while we feel that in bulk the work is mad and wanton, these new and unusual features place it, to an extent, far above the stock architecture which is the sum-total of the average practitioner's ability. As such we commend it to our readers.

Havoc on the Embankment. THOUGH so late in the day, we desire to add our support to the protest which is being raised against the havoc which the new tramways are making on the Embankment. Reasonable persons must agree that the existing means for crossing the Thames are totally inadequate. The want of some good service of trams has long been felt. Some people seem to forget that the bridges were made to use, not to look at, and while we should strongly oppose any scheme of overhead tramways across them—regarding the overhead system, albeit the most economical and easy to maintain, one of the most disfiguring elements in modern town development—we recognise that a conduit system is perfectly commendable; and as there must be a connection on the north side of the river between Westminster Bridge and Blackfriars Bridge we have never objected to the proposal to lay conduit tramways along the Embankment. But when the County Council, by the iniquitous regulation of a Select Committee of the House of Commons, starts laying the track so that the inside rail is only 2ft. 6in. from the kerb (instead of the usual 9ft. 6in. stipulated by the Board of Trade) we join with the protest against it; for, even if this does not mean the cutting down of the plane trees which make the Embankment the most delightful thoroughfare in London, it must necessitate such extensive lopping of the branches that the mutilation will be a serious blemish. With the track actually in process of being laid, however, we fear that no protest will now stop this ill-starred scheme, and we can only hope that at least no double-decked cars will be run on the lines, necessitating extra lopping off of the branches, for with these big cars it is necessary to have a clear space of 16ft. 6ins. above the metals.

Trafalgar Square. SCHEMES for the improvement of Trafalgar Square have been often brought forward, but usually they never get any further than paper stage. We suppose the reason is that opinion is so much divided as to what might be called an "improvement" of this notable place. For our own part, we have always thought that turf might be introduced with advantage around the fountains, but there are many people who prefer that the present expanse of granite should not be altered. The Office of Works, therefore, has apparently thought it best to let the Square remain as it is, and to pass unnoticed the periodical criticisms of the statues. We see, however, that a scheme has now been brought forward by the Navy League which has passed the unofficial paper stage, for the Office of Works has given consent to certain alterations suggested by the League. The scheme of improvement would seem to comprise chiefly the decoration of the two large pedestals at either end of the terrace, and the fountains, the removal of the statues of George IV., Napier and Gordon to more prominent positions in the Square, the placing on the terrace wall of bronze reliefs and medallions as memorials to seventeenth and eighteenth century admirals, and the erection of a drinking fountain on the west side of the Square to balance the entrance to the "Bakerloo" tube on the east side; also to give a more architectural setting to the latter. We have not seen the exact details of the scheme—indeed we do not think they have been formulated, as the Navy League has not yet sent out its appeal for subscriptions—but, so far as we can judge from the particulars available, we see no reason why this scheme should not be carried out. We notice that the Office of Works, while giving its consent to the League's proposals, draws a hard line against any "horticultural work," which would restrict the use of the space for public meetings, &c.

PRACTICAL NOTES FOR ARCHITECTURAL DRAUGHTSMEN.

By Alfred W. S. Cross, M.A., F.R.I.B.A., and Alan E. Munby, M.A.

THE ORDERS AND THEIR APPLICATION.

Introduction.

So many scholarly works upon the Orders are in existence, that some explanation seems to be called for in introducing another series of articles upon a subject that is, to all appearances, already well worn.

Notwithstanding the consensus of opinion as to the general proportions that ought to be followed in their delineation, an opinion based upon the rules laid down by the architects of an early period of the Renaissance, a surprising divergence from the precepts and practices of these old masters of their art is to be found in many buildings of our own time.

But whilst the setting out and general proportions of the Orders should be invariable, there is no objection, provided the spirit, grace and harmony of their prototypes be not lost, to exercising a certain amount of latitude in the treatment of their details and enrichments.

Unfortunately, however, we see on all sides designs for important buildings that have been ruined by their authors' lack of scholarship or inability to appreciate the fact that a general distortion and inversion of the proportions and properties of the Orders does not and cannot result in good architecture.

The majority of books upon the subject under discussion are written for the benefit of the student and consist, in many cases, of a series of plates exemplifying the methods advocated and employed by different architects, and although the variations found in a given Order, as delineated by diverse authorities, are chiefly those of detail, yet anyone who endeavours to compile for himself useful generalizations regarding such dimensions is apt to be baffled and discouraged by what appear to him to be irreconcilable discrepancies. *All* are examples to be followed, but before *any* can be advantageously studied the knowledge of the common ground-work which has influenced each authority seems necessary.

It is, however, not so much to the student as to the draughtsman, who already possesses some general acquaintance with the Orders, that these notes are indited; he, especially in the course of his office duties, requires concise rules to enable him to properly proportion and delineate them with rapidity and precision. These rules should be unencumbered by variations of detail, as to which the individual taste of the architect ought to be the deciding factor. The need of a small book of reference of the kind indicated is particularly felt where preliminary sketch drawings or competitive designs are in question.

The writers are only aware of the existence of one book which seems to meet the usual office requirements, and that is a work entitled: "Rules for drawing the several parts of Architecture," by James Gibbs, published in 1732; a book that has never been reprinted and copies of which are not now readily obtainable. The object aimed at, and successfully attained, is an illustration and description of an example of each Order, not "after Gibbs," but representing one of a good average type of design so proportioned that the dimensions of the various parts bear simple and easily discernible ratios one to another. The main divisions of each Order are further dealt with in detail on the same principle, and finally numerous plates are given showing their application to actual buildings. The republication of this valuable book in its present form is not very probable. The letterpress is somewhat discoursive and contains a certain amount of repetition, while the drawings are, in a measure, subservient to the size of the pages, resulting in an undesirable variation of scale and rendering rapid reference difficult. An attempt has therefore been made to co-ordinate the leading features of the book by re-drawing some of the illustrations, retaining the useful dimensions shown thereon and entirely re-writing the description of the plates, with the introduction of some general principles likely to be of value to the draughtsman and student, for which purpose the opinions of standard writers, particularly those of Sir William Chambers, have been freely incorporated. The descriptions of the dimensions contained in the letterpress have been collected and arranged in tabular form to enable the draughtsman to obtain, from data easy of reference and conveniently accessible, all the essentials for correctly setting up the Orders.

Before attempting such a condensation of the material in the book it was thought desirable to ascertain how far the generalizations adopted by Gibbs really represent the proportions used by acknowledged authorities. For this purpose the average ratio of the diameter of the column to the height of the entablature, as being a relation which essentially affects the whole proportion of the Order, was obtained by measuring a number of recognised examples, and it may be of interest to give the results, as an indication of the actual value of the dimensions used.

TABLE SHOWING THE APPROXIMATE RATIO BETWEEN THE LOWER DIAMETER OF THE COLUMN AND THE HEIGHT OF THE ENTABLATURE.

Tuscan.		Doric.		Ionic.		Corinthian.	
Alberti	1 : 1·5	Alberti	1 : 2·0	Alberti	1 : 1·4 1 : 1·7	Alberti	1 : 1·8
Palladio	1 : 1·8	Palladio	1 : 1·9	Palladio	1 : 2·0	Palladio	1 : 2·0
Scamozzi	1 : 1·9	Scamozzi	1 : 2·1	Scamozzi	1 : 1·8	Scamozzi	1 : 2·0
Vignola	1 : 1·8	Vignola	1 : 2·0	Vignola	1 : 2·3	Vignola	1 : 2·5
—		Parthenon	1 : 2·0	Fortuna (Rome)	1 : 2·3	Pantheon	1 : 2·3
—		Baths, Diocletian	1 : 2·0	Baths, Diocletian	1 : 1·9	Jupiter Stator	1 : 2·5
—		Temple Pæstum	1 : 1·7	Minerva, Athens	1 : 2·3	Jupiter Tonans	1 : 2·2
—		Apollo, Delos	1 : 1·8	Illius, Athens	1 : 2·3	Temple Antoninus	1 : 2·3
St. Paul's, Covent Garden	1 : 1·8	Bow Church, Portico	1 : 1·9	Banqueting Hall	1 : 2·0	Hampton Court	1 : 2·2
Average	1 : 1·76	Average	1 : 1·93	Average	1 : 2·00	Average	1 : 2·00
Gibbs	1 : 1·75	Gibbs	1 : 2·00	Gibbs	1 : 1·82	Gibbs	1 : 2·00

The above examples have not been selected with any intention of justifying the proportions adopted by Gibbs, but are merely cited as those which readily occurred to the mind, or of which the dimensions could be easily obtained.

The result renders it evident that the general proportions of the Orders as recommended for adoption by this architect are fully worthy of confidence, if, indeed, the correctness of the architecture of his own buildings does not in itself warrant such an assumption.

The letterpress attached to the plates has been curtailed as far as possible, for although the elucidation of rules forms a fascinating study, and may even lead to the discovery of interesting and hitherto unsuspected relations between component parts of the orders, the investigation of such theories is best left to the dilettante and man of leisure. Whether, however, the value of rules for minute sub-divisions is real or imaginary, it is certain that no ordinary mind can retain more than a very limited number of them. Hence, it would obviously seem preferable to master a few main dimensions, and, having thus inculcated a general sense of proportion, to rely upon gaining familiarity with the plates by constant use, when the proportions of the smaller members of the compositions will become naturally assimilated. The Composite Order is given in Gibbs' book, but, owing to its similarity to the Corinthian and to the absence of a consensus of opinion as to its dimensions, it has not been included in the present work. The addition, however, of this Order to the scheme would not form a very serious undertaking should it be desired for any individual purpose.

No enrichments have been shown on any of the Orders to avoid distracting attention from the dimensions. With the exception of the whole of the Tuscan Order and of the frieze of the Ionic Order there are few members, apart from mere fillets, which have not been enriched, by some form of ornament, in one or another example, the Doric naturally the least and the Corinthian the most. In the latter Order, in fact, even the cyma and corona of the cornice, in addition to the frieze, ogees and beads, are often ornamented, but, apart from the question of expense, it is undesirable to carry such elaboration too far, as when placed in close contact with each other, especially when a distant view is alone possible, one moulding will often rob another of its effect, and, indeed, the value of richness of detail is more often than not lost in this manner.

The enrichment of columns beyond ordinary flutings is generally to be deprecated, while the application of ornament to bases and pedestals is seldom either requisite or desirable.

However great may be the utility of drawings dealing with the Orders, it should never be forgotten that they are merely a means to an end, that end being an executed building. Those whose work is confined to a drawing board develop a strong tendency to consider their compositions solely from an elevational and artistic draughtsman's point of view, and every opportunity should be taken of checking this habit and of cultivating the art of thinking "in the round." The study of perspective of buildings, and, best of all, the preparation of models of portions of a proposed building, an occupation which often results in the discovery of latent defects of design, are alike of the greatest educational value to the student of architecture.

"Practical Notes for Architectural Draughtsmen: The Orders and their Application."

Tabulated Dimensions of the Orders. Arranged Progressively as Required for Use.

	Dimension required.	Tuscan.	Doric.	Ionic.	Corinthian.	Dimension = 1.
	No Pedestal Height of Entablature	$\frac{1}{5}$	$\frac{1}{5}$	$\frac{1}{6}$	$\frac{1}{6}$	Total height of Order.
	With Pedestal Height of Pedestal	$\frac{1}{5}$	$\frac{1}{5}$	$\frac{1}{5}$	$\frac{1}{5}$	” ” ”
	Height of Entablature	$\frac{1}{5}$	$\frac{1}{5}$	$\frac{1}{6}$	$\frac{1}{6}$	Height of Order less Pedestal.

	THE PEDESTAL.					
Vertical.	Height of Plinth	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	Height of Pedestal.
	” Base	$\frac{1}{3}$	$\frac{1}{3}$	$\frac{1}{3}$	$\frac{1}{3}$	” Plinth.
	” Cyma of Base	$\frac{2}{3}$	$\frac{1}{2}$	$\frac{1}{2}$	(and fillet) $\frac{1}{2}$	” Base.
	” Fillet below Cyma	1	1	1	1	Fillet above Cyma.
	” Cap	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	Height of Plinth.
	” Base of Corona to top of Cap	$\frac{2}{3}$	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	” Cap.
Horizontal.	Projection of Cap and Plinth over Die	1	1	1	1	” Base of Pedestal.
	” Corona of Cap over Die	$\frac{3}{4}$	$\frac{3}{4}$	$\frac{3}{4}$	$\frac{3}{4}$	Projection of Cap over Die.

Note.—The "Diameter" is always the greatest diameter of the drum of the Column. M. refers to the Modillion Cornice. D. to the alternative Dentil Cornice.

The Setting up of an Order.

(To be studied in connection with Plates I., II., and III.)

The sequence followed in setting up an Order will be found to influence, to some extent, the rapidity and facility with which it can be accomplished. An outline of the method of procedure may, therefore, prove useful.

Usually the height of the Order is fixed by circumstances, as, for example, when it is to be applied to a given storey of a building.

The total height having been settled, draw the limiting horizontal lines and then set out the vertical centre lines of the columns, thus dividing the frontage to be treated into bays appropriate to the exigencies of the design and having due regard to the correct intercolumniation of the Order adopted. If a pedestal is to be placed under the column, cut off one-fifth of the total height for it, and cut off one-fifth or one-sixth of the remainder (measured from the top limiting horizontal line) for the vertical height of the entablature; the intervening space gives the height of the column, including its cap and base. If no pedestal is to be used, divide the whole of the given height into five or six parts, cut off one of these parts, from the top, for the entablature, and the remainder gives the height of the column.

The Column. Since some of the dimensions of the entablature are in terms of the diameter of the column, the latter should be next developed. The term "diameter of the column" refers always to its greatest diameter—namely, that of the shaft just above the lower cincture. This dimension is one-seventh to one-tenth of the height between the soffit of the entablature and the top of the pedestal, or lower limit of the Order in the absence of a pedestal. If the centre lines of the piers do not represent the centres of the columns, as, for instance, when coupled columns are used, the centre line of one of the columns must now be decided upon and the diameter of the Order symmetrically disposed horizontally across it. A semi-diameter is then cut off, from the bottom of the column, for the height of the base, and it should be noticed that this—except in the Tuscan and alternative Doric Orders—does not include the fillet at the base of the shaft, the members above the upper torus being reckoned as part of the shaft, as are also the astragal and fillet below the necking of the capital of the column. The plinth and lower torus of the base project one-third and the upper torus one-fifth of a semi-diameter beyond the lower circumference of the shaft. The leading lines for the base having thus been obtained, cut off by a horizontal line the height of the capital from the top of the column, and (except in the Ionic Order) again below it, a height equal to one-sixth of a semi-diameter for the astragal and fillet below the necking.

The semi-diameter of the shaft at one-third of its height from the bottom is then divided into five or six parts, and four or five of these parts are taken as a semi-diameter at the top, below the astragal. The shaft may now be completed, the entasis being usually made to start from the greater diameter, one-third up the shaft, below which point it is a true cylinder until the cincture at the base is reached. This is the best method to adopt in the case of small scale drawings. Where large detailed drawings are in question the diameter may be alternatively divided at the base of the shaft instead of at one-third of its height, and the entasis extended throughout the whole length. The completion of the shaft enables the projection of the capital to be marked off, and also that of the astragal and fillet, which is equal to their combined height.

The Entablature. The development of the entablature can now be proceeded with, the architrave, freize and cornice being ruled off horizontally and the members of each inserted (see dimensions). The projections for a returned end or section are obtained from the upper diameter of the shaft. The lowest member of the architrave, and also the freize, lie vertically over the circumference of this upper end of the shaft. The projection of the cornice beyond the freize line is equal to its height, except in the Doric Order, in which the projection is one-third more than its height of one diameter. Further rules dealing with minor projections and the position of the modillions, dentils, &c., will be supplied by a study of the plates and tabulated dimensions.

Pedestal. Finally, the pedestal, if any, should be divided vertically into four parts; the lower part is ruled off for the height of the plinth, one-third of the second part for the height of the base, and one-half of the top part for that of the cap. The projection of the die is equal to that of the base of the column, and the plinth and the cap of the pedestal extend beyond this for a distance equal to the height of the base of the pedestal previously obtained.

The above dimensions will all be found in the subjoined table, which represents an endeavour to bring together, in a form suitable for reference, sufficient information to make any glaring disproportion impossible.

A few of the minor divisions are only approximations; they will, however, be found to be sufficiently accurate for any but large detail drawings, in which it is not desirable to destroy all individuality by rigorous mechanical rules.

On the left hand will be found the dimension required and, in the intermediate column the fraction for each Order of the previously ascertained unit given in the right-hand column.*

Plate I.

Plate 1 represents the four Orders drawn to a common vertical height.

The pedestal may or may not be required and, if used, it is to be regarded as an addition to the Order, the relative dimensions of the parts of which are not altered by its removal or introduction.

The diameter of the column (by which is meant the diameter of the shaft above its lower cincture) is the ruling dimension from which most of the others are obtained, and the smaller circumference of the top of the shaft always coincides with the frieze line from which all the projections of the entablature are set out.

In judging the value of such projections it should be borne in mind that in execution the higher vertical faces of the composition will usually be much foreshortened to the observer and that there will be a consequent increase in the comparative value of neighbouring projections.

A perusal of the table will indicate those dimensions which all the Orders have in

---

*A large number of these dimensions appear again and again upon the plates, but to avoid confusing the drawings all are not shown, and some dimensions will be found thereon which do not lend themselves to insertion in the tabular statement.

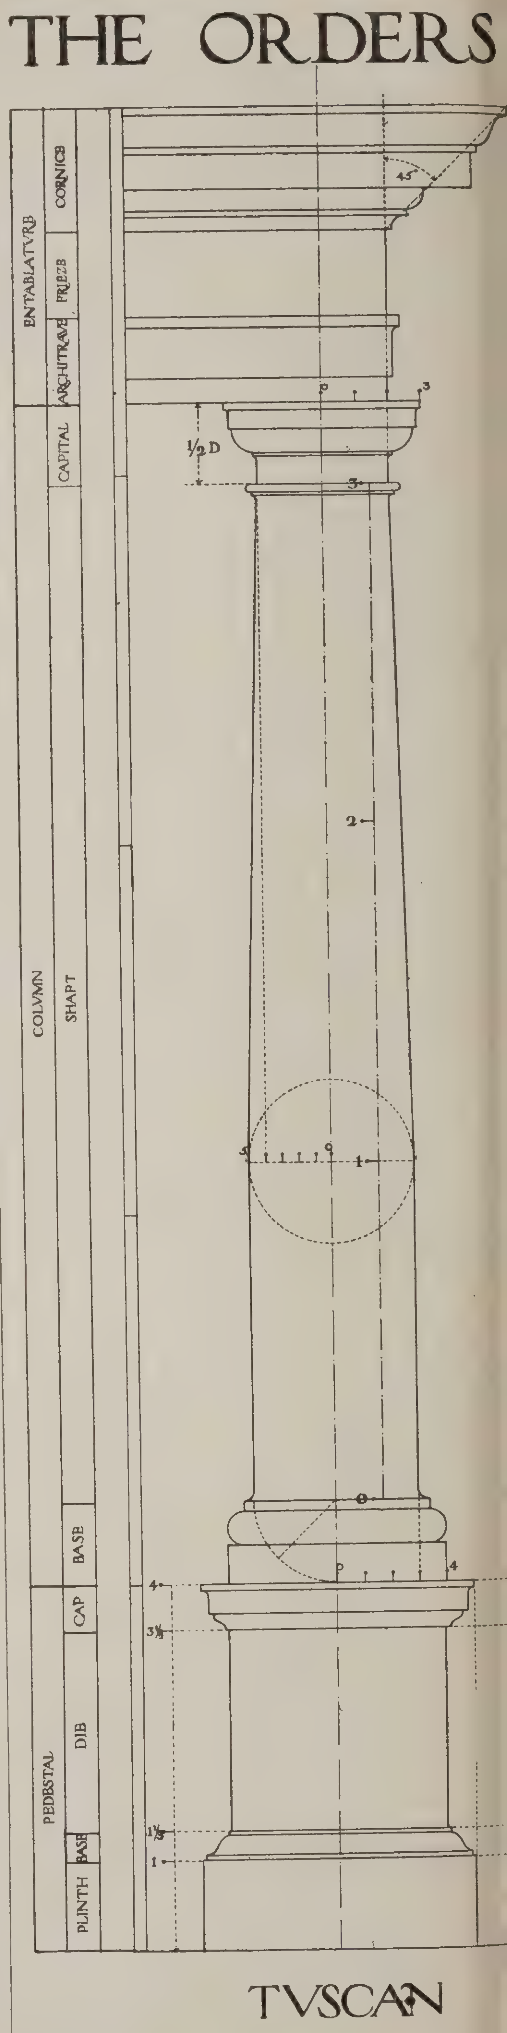

PLATE . I

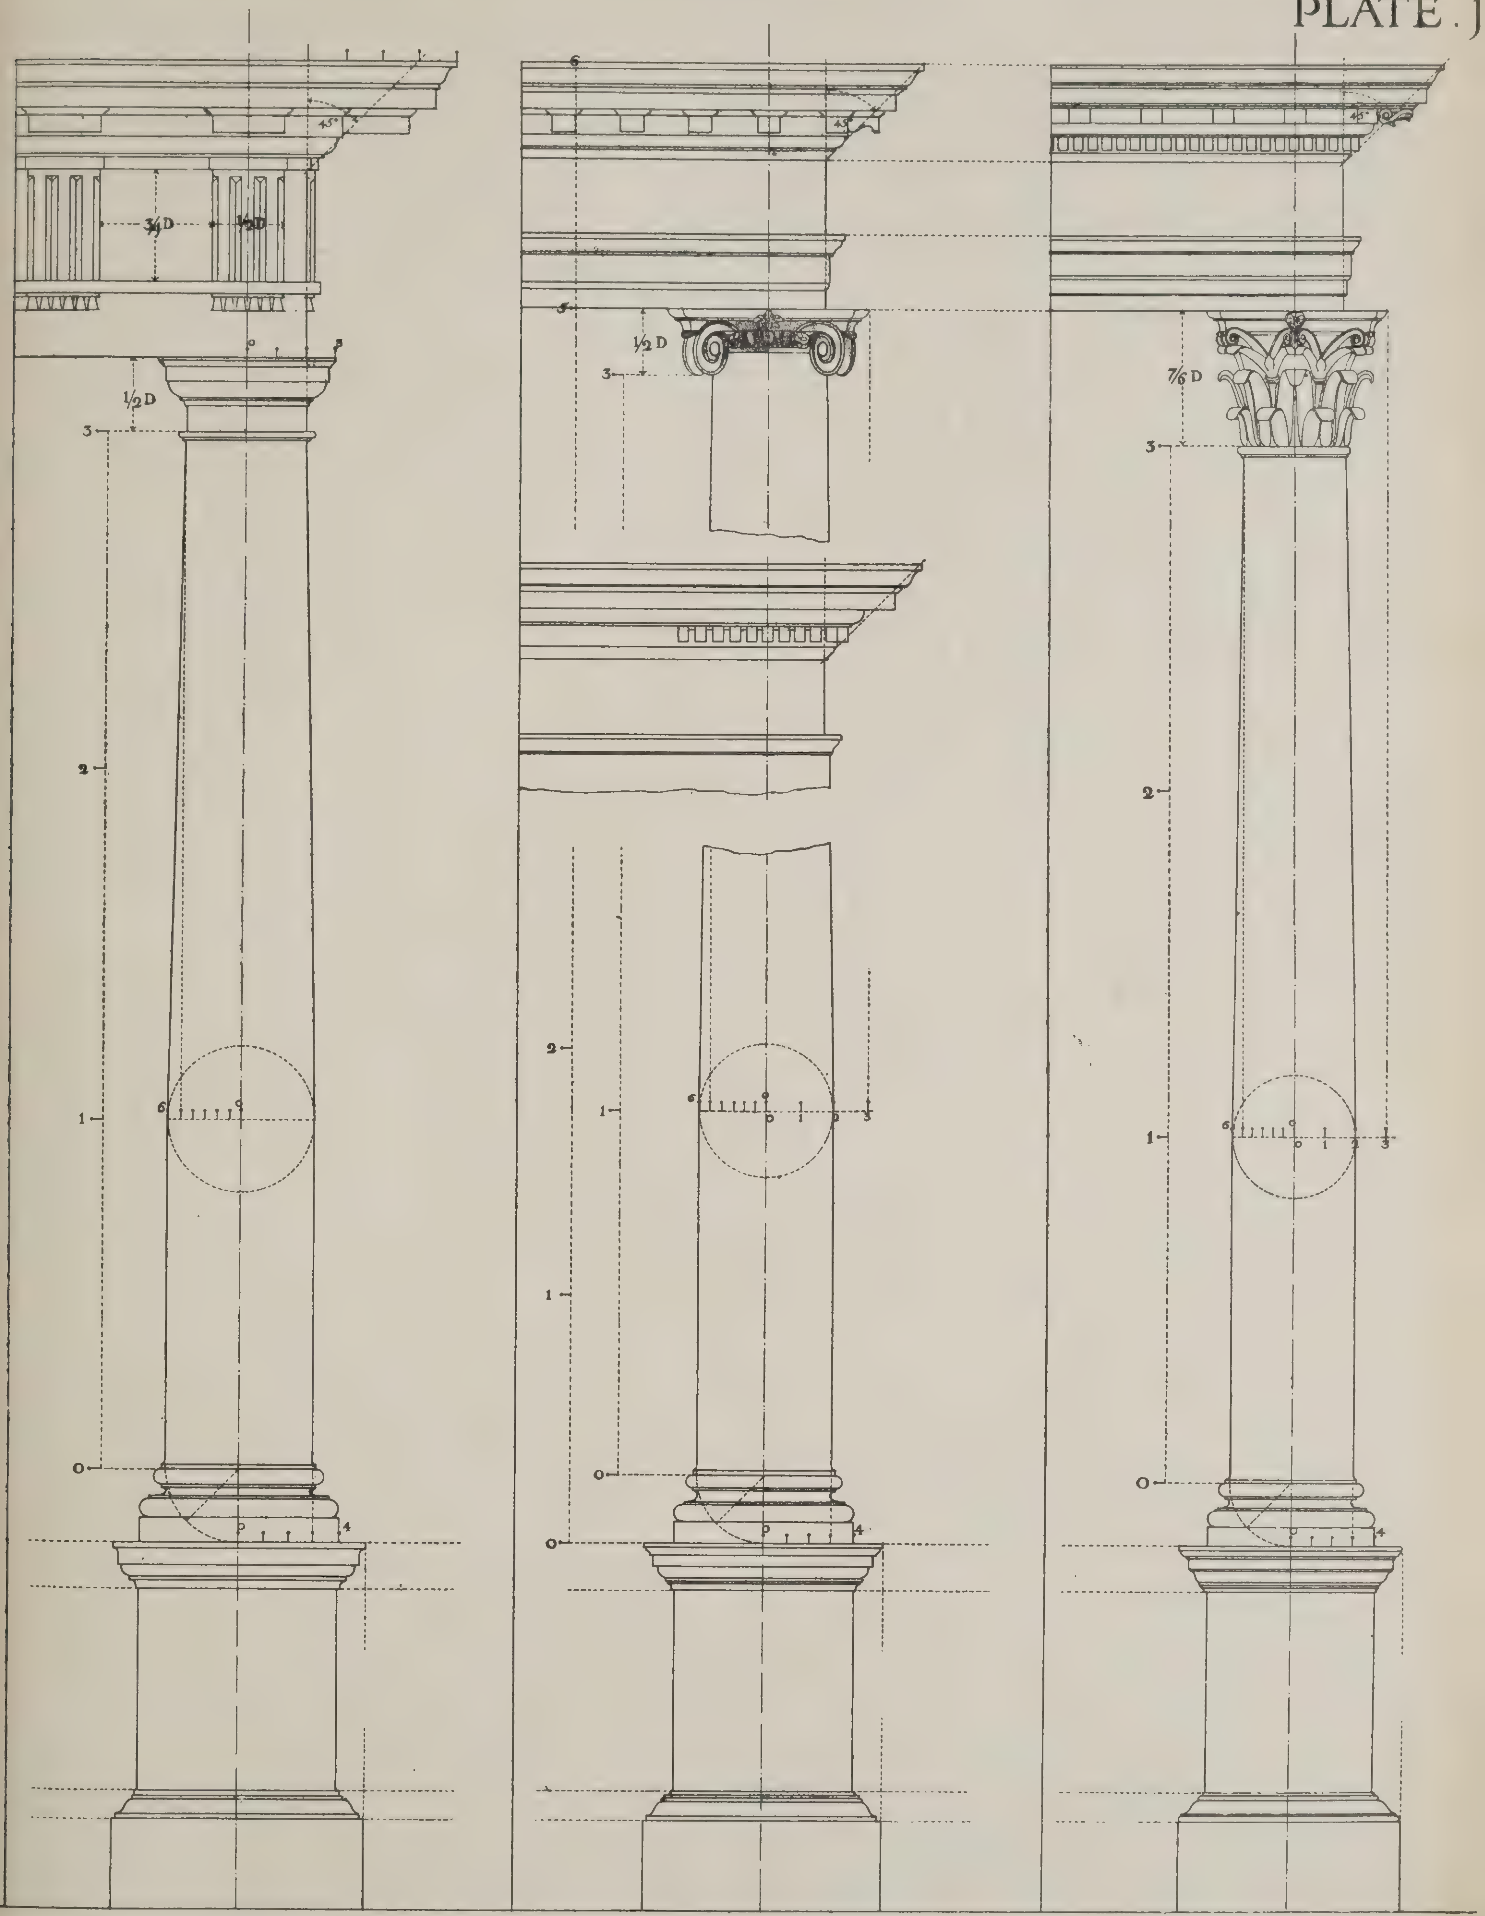

DORIC IONIC CORINTHIAN

THE ORDERS AND THEIR APPLICATION. BY ALFRED W. S. CROSS, M.A., F.R.I.B.A., AND ALAN E. MUNBY, M.A.

common, but for convenience of reference they are further summarised thus:—

Height of Pedestal, $\frac{1}{5}$ total height of Order.
Height of Plinth, $\frac{1}{4}$ height of Pedestal.
Height of Pedestal Base, $\frac{1}{3}$ height of Pedestal Plinth.
Height of Pedestal Cap, $\frac{1}{2}$ height of Pedestal Plinth.
Projection of Cap and Plinth, $\frac{1}{3}$ height of Pedestal Plinth.
Projection of Corona over Die, $\frac{3}{4}$ projection of Pedestal Cap.
Height of Column Base, $\frac{1}{2}$ Diameter of Column.
Projection of Base over Shaft, $\frac{1}{3}$ Semi-diameter of Column.

Pilasters. The general proportions allotted to the columns of the Orders apply also to pilasters, which may be regarded as columns square on plan, but almost universally deeply engaged. The projection of pilasters must be regulated by circumstances. If impost mouldings or other projections stop upon them, as on the inner wall of an arcade, these projections must be sufficient to take the mouldings, and if they line with engaged columns crowned by an entablature, they must have a projection similar to the columns, and therefore in such cases never less than a semi-diameter. Apart from these considerations, the projection should be about one-fourth of the diameter. Pilasters may be fluted or plain; if the former, the flutes should be, as far as possible, the same size as those of the adjoining columns, and always an odd number.*

On plain faces 7 flutes (occasionally 9) are used, and therefore in the above case 4 flutes (or 5) would be employed on each side of the re-entering angle. The returned sides of pilasters should never be fluted unless the projection is as much as half of a diameter. The diameter assigned to a pilaster will be that of a column (if any) used in conjunction with it. The shaft may or may not be diminished.

If the pilaster stand alone it is best formed with the same top and bottom diameter, but if a column stand in front of it then it should be diminished to the same extent as the column. Entasis is not usually given to pilasters.

Unless columns and pilasters are monoliths the shafts should be built up of three drums and not two, as a central joint, unless exceptionally well executed, has a very disagreeable appearance.

(To be continued.)

---

* In the case of a pilaster returning on the internal angle of a building, half of a flute may be added to each side of the half pilaster to give greater breadth, and thus avoid too much mutilation of the capital.

Our Plates

How Green, Hever, Kent.

This house has been erected for M. V. Charrington, Esq., on the high ground to the north of Hever Church and overlooking the valley of the Eden. It has been planned to get as much sun as possible. The walls are faced with bricks from Crowborough; the tiles for the vertical tiling come from Dunton Green, and those for the roofing from Ashford. The window frames are of oak with leaded lights and iron opening casements. The contractors were Messrs. Mussellwhite & Sapp, of Basingstoke. Mr. W. F. Milne acted as clerk of works. The architect was Mr. R. Weir Schultz, of 14, Gray's Inn Square, W.C.

New Premises of Messrs. Spalding & Hodge, Ltd., the well-known paper firm, have been erected in Drury Lane from designs by Messrs. Harrison & Ward.

Kirkintilloch's New Town Hall, just completed, has cost £9,000. The architects were Messrs. Walker & Ramsay, of Glasgow, whose design was selected in competition.

Correspondence.

Cleveleys Cottage Exhibition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I was interested to see in your last issue the illustrated article on the exhibition of cottages at Cleveleys. The jerry-built stock-moulded hat-box-on-the-side-of-a-railway embankment type of house has been perpetrated a few times at Cleveleys, but, barring these, the cottages are well worth a visit, as they reflect credit on architect and builder. Some have original little tricks of construction or ornament besides good internal arrangements, and these are worth noting for future reference. Many houses, though, are spoilt by want of thought in their planning, appearance being the first consideration instead of comfort. In one case an outside door opens inwards in such a way that it necessitates ushering the guest into the living room while the outer door is being closed; then by dodging round an ante the friend reaches the hall. Many cottage bedrooms could only permit of a bed 3ft. wide being placed in its proper position, and this mistake in nearly every case occurs in the principal bedroom. Fireplaces in sitting-rooms are frequently so placed that no one could sit near them in comfort. Staircases were evidently stumbling blocks to many planners—few are a success. Some are ideal dust-traps, with handrails fixed at heights varying between 2ft. and 4ft.—some could not be grasped by an adult, let alone a child, while others the small boy would break off. First-floor landings are in numerous cases cut down to a minimum, so that no furniture could be cajoled into a bedroom unless through the window, and, even in that case, the opening is so artistically small that no wardrobe could be pulled through it without taking off the gable-end of the house. One bungalow has a servant's bedroom in the roof reached by means of a cat-ladder from the scullery, and as the roof has a fair span this valuable space is useless as a sleeping apartment. Doubtless other architects could add a few other notes to the list of novelties.—Yours truly,

W. EDWARDES SPROAT.

Liverpool.

A Circulating Technical Library.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With reference to the leader on the above in your issue for September 12th, you may be interested to know that at the commencement of the present session this Society reorganised its small collection of books, added considerably thereto, and formed a circulating technical library, with the idea that its many members and students in the provinces who are unable to obtain the books so easily as London members may have the volumes forwarded to them through the post.

This new development has been very successful, and within a few months between two and three hundred volumes have been circulated. Large and unwieldy, or specially valuable, books are of course restricted to the reference library.

I have no doubt other architectural societies afford their members similar advantages, and my object in writing to you is to support your view that there is scope for a circulating technical library.—Yours truly,

C. McARTHUR BUTLER,
Secretary, Society of Architects.

LONDON.

NORTHERN POLYTECHNIC.

The prospectus for the forthcoming session at the Northern Polytechnic, Holloway, has just been issued. The Architectural and Building Department is now organised in four sections—namely, the architectural and building day school, the building day trade school, manual training courses, and evening classes. The architectural and building day school for young architects, builders and surveyors is provided with a third-year course of day study to be taken by pupils if desired. A new special two-years' evening continuation course for advanced students is also provided as an alternative to the third-year day course. The second-year course is in part differentiated so that pupils who intend to become builders or estate surveyors may have opportunities of taking special classes in correspondence and book-keeping, and in office routine and business methods.

The Day Trade School

is an entirely new departure, and has been established as the result of a conference of building employers and others held at the Polytechnic last winter. The aim and object of this school, which is the first to be established in special connection with the building trades in England, is to partially replace the apprenticeship system. In view of the practical disappearance of this system in London, and the difficulty experienced by parents and guardians in obtaining for boys a training in the skilled trades, the Northern Polytechnic now undertakes such practical training, and for the purposes of this school new building extensions are contemplated.

In the evening classes the courses on "Theory of Structures and Structural Engineering" and the special course of lectures on "Modern Building Practice" are this year incorporated in the course for Honours Building Construction, although either may still be taken independently. The "Mould-Cutting Class" is designed to meet an urgent need in the study of masonry, and new electrically-driven machinery for stone-rubbing, lathe-turning, &c., has been placed in the masonry workshops. The Building Students' Association (secretary, Mr. A. J. Thomas, 124, Englefield Road, N.) yearly arranges a series of visits to buildings and works.

Another feature to be introduced this year, not mentioned in the syllabus, is the improved system under which building construction will be taught. Hitherto the almost universal method of instruction in this subject has consisted of lectures on a comprehensive series of building details, followed by production of drawings of detached items of construction. In spite of the teachers' best efforts the drawings too often remain mere abstractions to the student, while his ideas of building construction are diffuse and incomplete. Under the new system the study of details will be co-related, leading up to a single but complete design of a building. Large scale take-to-pieces models of complete buildings have been provided for this purpose, and the advantage which the student will obtain through seeing and drawing the actual details as added, and when co-related, to the other details in the actual production of the complete building will be a factor of great importance.

The head of the architectural and building trades department is Mr. Hugh Davies, F.G.S.

Notes on Competitions

List of Competitions Open.

DATE OF DELIVERY	COMPETITION.
Sept. 20	SCHOOL AT SUNDERLAND. Limited to local architects. Premiums of £5o, £20 and £10. Particulars from John W. Moncur, Borough Engineer, Town Hall, Sunderland.
Sept. 21	CONVALESCENT & NURSES' HOME AT GLOSSOP. Premiums of £20 & £10. Particulars from Mr. T. W. Ellison, Town Clerk, Norfolk Chambers, Glossop.
Sept. 22	SEWERAGE SCHEME FOR NEWCASTLE, Co. DOWN. Terms, references, experience, by this date, to Daniel Curran, Town Clerk.
Sept. 24	SCHEME TO UTILISE EXHAUST STEAM AT LAMBETH WORKHOUSE. Particulars from George E. Arnold, C.E., 195, Kennington Road, S.E.
Sept. 28	COTTAGE HOMES AT CLEADON and receiving house at workhouse, for Guardians of South Shields Union. Particulars from J. W. Coulson, Union Offices, South Shields.
Sept. 28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, clerk to Urban District Council, Ellesmere.
Sept. 29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50 and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Sept. (last week	PREMISES AT LEVEN, for Reform Co-operative Society, Ltd. Particulars from D. C. Wilson, secretary.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
Oct. 20	SEWERAGE SCHEME FOR HIGHBRIDGE, Somerset. Premium £20. Particulars from W. C. Shier, Surveyor to the U.D.C., Highbridge.
Oct. 22	SCHOOL AT GAYWOOD, King's Lynn. Particulars from Secretary, County Education Office, 57, London Street, Norwich.
Oct. 31	BOURSE AT CAIRO.—Premiums of £E250 and £E100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Dec. 14	FOUNDLING HOSPITAL, MONTEVIDEO.—Four selected designs in preliminary competition to be awarded £212 each; first premium of £742 in final competition. Particulars from Consulate-General for Uruguay, 5 & 6, Clement's Inn, London, W.C.
No date	LIBRARY AT FRIBOURG, Switzerland (International competition.) Particulars from "La Direction des Travaux Publics," Fribourg.

Competitions under the Tarsney Act.

At the International Congress of Architects held in London in July it will be remembered that the subject of international competitions was discussed. Some reference to the Tarsney Act was made by an American delegate. This is an important Act, and the following precise particulars of it may be serviceable. The Act became law in February, 1903. It authorises the Secretary of the Treasury to obtain, by competition, designs for Government buildings to be erected under the supervision of the Treasury Department, provided that not fewer than five architects are invited to compete, and that the general supervision of the work continues in the office of the Supervising Architect. The regulations for the conduct of competitions under the Act stipulate (1) that the selection shall be made by a jury of four architects of established reputation and the Supervising Architect; (2) that the successful competitor shall be paid 5 per cent. on work up to £100,000, 3½ per cent. on the next £100,000, and 2½ per cent. on any amount over £200,000; (3) that of this commission the architect shall be paid $\frac{1}{5}$th when preliminary drawings are completed, $\frac{3}{10}$ths when working drawings are made, and a percentage monthly on the basis of work done; (4) that the architect shall provide one set of tracings of all drawings, the Department to take prints from them; and (5) that the right is reserved by the Secretary to dismiss the architect or revoke his commission if found incompetent, equitable compensation being allowed for work done. The regulations have been modified from time to time, an important case being that of the New York Custom House (Cass Gilbert, 1899), when the architect's commission for work over £100,000 was fixed at 5 per cent. on the total cost. Twenty-two competitions have been instituted by the United States Government under this Act, and it is satisfactory to know that in every case the profession has felt the award to have been unbiassed, and in favour of the best design submitted.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Smoky Chimney.

GATESHEAD.—J. R. H. writes: "I have an outshot kitchen with range; chimney about 30ft. high, and a patent pot fixed on top. In a north-west or south-west wind of any force the chimney smokes. The chimney is surrounded by buildings on west and north at a distance of about 30 yards. The north side is open. Can you suggest a remedy?"

The situation in which the chimney is placed is a troublesome one, but we think that by the use of a good chimney-pot (there are several on the market that it would be invidious to mention), which practically prevents any possibility of down draught, and the securing of an unrestricted flue and a plentiful supply of air in a room so as to give a sufficient quantity to cause a quick draught, the trouble may be remedied. We advise you to consult one of the several specialists who advertise pots with a record of efficiency.

Land Surveying.

ENFIELD.—THEO writes: "Are there any examinations or degrees in land surveying? The Surveyors' Institution is not exactly to my requirements, as land surveying proper only occupies a minor position in its syllabus. Also, which are the best schools of training for same."

The Surveyors' Institution examination grants the only degree so far as we are aware. We could suggest several polytechnics, but probably the City of London College, White Street, Moorfields, E.C., will serve your purpose.

Architect's Department, H.M. Office of Works

GLASGOW—K. writes:—"From whom can I get particulars of the architectural department of H.M. Office of Works?"

Write to the Secretary, H.M. Office of Works, Storey's Gate, Westminster.

Property Adjoining Churchyard.

DORSET writes:—"A friend of mine has some property adjoining a churchyard and within 10ft. of graves recently made there. He is anxious to repair his property but dreads the probability of the sanitary authority stepping in and condemning it. The houses are now rather dilapidated, and he does not want to call the attention of the sanitary authority to them by any action of his. Has the law any power over the property by reason of its proximity to a burial ground?"

The sanitary authority cannot interfere under such conditions.

Books for Architect and Surveyor.

LINCOLNSHIRE.—M. F. G. writes: "I am a young student in the architectural surveyorship, and should like to know the complete list of books required in these two professions."

Apply to the secretary of the Surveyors' Institution for a copy of the syllabus of subjects and examples of papers set at examinations, price 1s. 6d.

Definition of an Ambulatory.

PORTSMOUTH.—R. J. J. writes: "Would it be correct to call the passage through the length of the clearstory wall of a cathedral giving access to the windows an ambulatory?"

Yes. The word ambulatory means a passage anywhere in a building.

Architectural Assistants Abroad.

GLASGOW.—CLYDE writes: "Please give information about the prospects of architectural assistants abroad—say, in the United States or Canada. I noticed in your paper a few months ago that there were good demands in Canada (although the High Commissioner for Canada says they are not encouraged, there being no difficulty on the spot to fill any vacancies that occur). I have also heard there are plenty of opportunities in Hong-Kong and Shanghai, but have no definite information, and they are both far away to go on the off chance."

In our opinion Canada offers the best field in the rapidly-growing towns in the North-West provinces. The United States also offers opportunities to the efficient draughtsman, but we would not advise correspondents to seek employment in India, the Far East, Australia, and South Africa.

The R.I.B.A. Kalendar.

LONDON.—L.M.B. writes: "Where can I get the Kalendar of the Royal Institute of British Architects?"

From the Institute offices, 9, Conduit Street, London, W.; price 2s. 6d.

ARCHITECTURAL ASSOCIATION.

The curriculum of the Architectural Association School of Architecture has just been issued. The next term commences on October 1st. The syllabus of the Discussion Section for the forthcoming session is as follows:—

Oct. 17—Motor Garages, by M. G. Pechell.
,, 31—Quantities and Cost, by G. M. Nicholson.
Nov. 22—Do Architects Justify their Existence? by H. G. Ibberson.
Dec. 3—Factory Design, by Adam Hunter.
,, 19—The Responsibilities of Style, by L. Stanley Crosbie.
Jan. 9—Wallpapers, by N. D. Sheffield.
,, 23—Water-Supply, by H. Rofe.
Feb. 6—Architecture and the Public, by T. L. Dale.
,, 20—Colour Decoration, by H. C. Corlette.
Mar. 6—Sewage Disposal, by F. J. Osborne Smith.
,, 20—Fences and Gates, by W. L. Trant Brown.
Apl. 17—Pavements and Responsibilities of Architects, by A. O. Collard.

Obituary.

Mr. William Pogson, architect, of Carlisle, died last week, age 60.

AIGBURTH VALE GIRLS' SECONDARY SCHOOL COMPETITION.

Only members of the profession in actual practice in Lancashire and Cheshire were allowed to compete for the above building. About 40 designs were received, chiefly from Liverpool and Manchester architects. The assessor appointed by the Education Committee was Mr. Frank G. Briggs, F.R.I.B.A., and his awards have yet to be confirmed by the Council. The designs have been on view at the Central Municipal Technical School, Liverpool, during the past week for the inspection of competitors only. From a careful examination of the principal designs, it has evidently been a very keen contest. Many of the architects within the area of the competition are known to be thoroughly conversant with school-planning, and in a few cases two complete schemes have been submitted by leading firms. The chief problem was the planning of a suitable building to fit the awkward shaped site, and yet to conform with certain restrictions on the position of the school and the entrances thereto, with a correct aspect to ensure sunlight entering each classroom during some of the teaching hours. The former difficulties have been too carefully borne in mind by the majority of the competitors to the exclusion of more important points which apply to school-planning. Many schemes were sacrificed to these local requirements which the Education Committee suggested in the conditions of the competition. In this instance the architects who nominally departed from what is considered the natural interpretation of part of the conditions and struck out on an original position (on Mosley Hill Drive) for the school buildings have been placed first. All competitors had to plan the buildings for a limited area, and the successful design is cleverly adapted to work in with the angles of the adjoining roads and fulfils the conditions by keeping within the suggested boundary lines. All the other schemes showed the school in the centre of the site, or on the boundary facing Aigburth Vale. The conditions with the sun aspect and the position of entrances led nearly all the competitors to follow on this arrangement in their block plans. Cloak-room accommodation had to be provided for 100 juniors and 300 seniors. Many plans had their balance upset by adhering to this division. All the premiated designs wisely compromised the accommodation to 200 for each cloak-room.

The result of the competition is highly satisfactory to all concerned. The assessor has had some difficulty in separating from about a dozen carefully planned schemes the three premiated designs. There may be differences of opinion with reference to the entrances and position of the buildings, but the assessor has been fully justified in his selection, as the successful plans in their arrangement are better adapted for a secondary school on this particular site than any other scheme submitted.

Design Placed First.

This has been submitted by Messrs. Grayson & Ould, of Liverpool. (First premium £50.) One of the principal features of this design is the self-balanced plan, coupled to an agreeable elevation which presents a good appearance to every road, particularly to Aigburth Vale and Mosley Hill Drive — a point which many have overlooked, but none the less important, owing to the site being an open one and situated in a better-class suburb. The main entrance is only a few feet from Mosley Hill Drive, and the conditions stated that Aigburth Vale was preferred for entrances. Judging from the block plan, in the laying out of the playfields, &c., some detached plots of grass and pathways break up the playground space, and the east front in particular. A portion of the playing field is not directly under supervision, owing to the south projecting wing. The buildings are shown on the level portion of the site. The scheme of placing the central hall, class-rooms and administrative-rooms in the main block and all the subsidiary buildings, which might be objectionable for sanitary reasons, or for considerations of noise, in detached wings, were also important points which influenced the assessor in the favour of this design. In a few minor details the plans may need revising to meet the requirements of the Education Committee. The main staircases have rather many circular steps on the ground floor and the corridors in the wings could be wider, as there will be much traffic on them at intervals in going to and from the lavatories, cloaks, bicycles, &c. As the sixth-form room and library are combined in one room, it should be placed nearer the head-mistress's room. All the first-floor galleries round the central hall should be wider, as this floor accommodates about 200 scholars. The store-room and cooking stores could be added to the crush corridor with advantage. Objection may be taken by non-competitors to the cookery room being entered off the gallery on the first floor, but the conditions were not clear on the point and suggested that this room might be used for various purposes and only occasionally for cookery lessons. The two practice rooms provided can only be entered off the music-room. In the side wings, at a lower level and over the cloaks, are the laboratory, music and practice rooms, dining hall and kitchen offices—the latter having north aspect. The elevations are simple in character, suitable to the purposes of the building. Stone quoin pilasters sparingly used add interest to the various gables.

Design Placed Second.

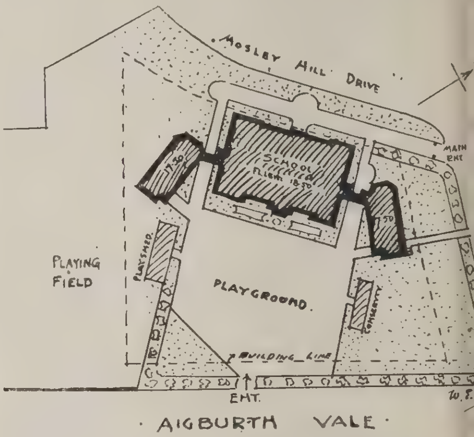
The second premium (£30) is awarded to Messrs. Appleyard & Quiggin, of Liverpool. Their plan is most compact, and in many respects is similar to the accepted design, with the side wings at the back, so that they do not intercept the sunlight at certain hours. Three of the class-rooms have a north aspect, and the position of the latrines and bicycle store at one end of the building for both seniors and juniors is not to be commended. In the majority of the classrooms, the windows do not extend far enough into the corners of the outside wall, and the fire-places are too central for the comfort of the teachers, and occupy part of the black-board space. The general disposition of the rooms is good, but the minor details have not been so well considered. Some steps across the corridor on the first floor leading down to the exit staircases are badly placed. The elevations are very plain, but the half-inch scale detail is an interesting drawing in pencil and monotint wash.

Design Placed Third.

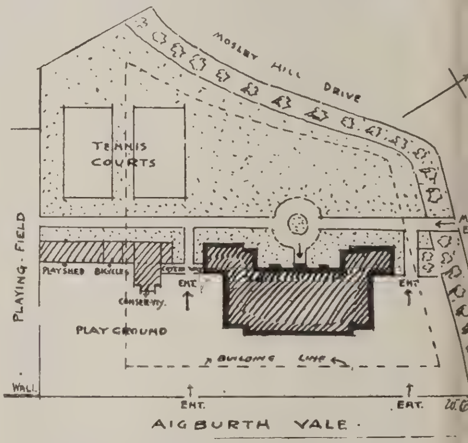
The third premium (£20) has been gained by Messrs. Willink & Thicknesse, of Liverpool. The type of plan adopted is an expensive one for a school where the cost is limited and clearly stated in the conditions—namely, £30 per head. In many points the plans bear a similarity to one of the premiated designs for the recent Newcastle-on-Tyne Grammar School. This scheme adapts itself to the peculiar shape of the site. Objectionable features are the long wings projecting on the south side, which contain cloak-room accommodation extending over 100ft. in length. The special rooms for teaching are also much larger than necessary; everything provided is on the same basis, except the height of the class-rooms.

Other Designs.

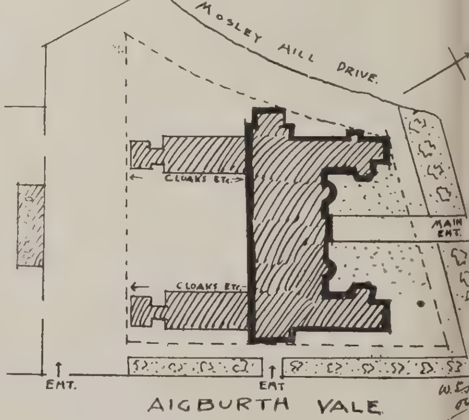
The set of drawings submitted by Mr. M. Honan, of Liverpool, were highly commended by the assessor; it is, in our opinion, superior in every respect to the third premiated. Some excellent schemes were prepared by the authors of Nos. 2, 31, 32, 26, 10, and 8. Internal areas were a noticeable feature in many designs.



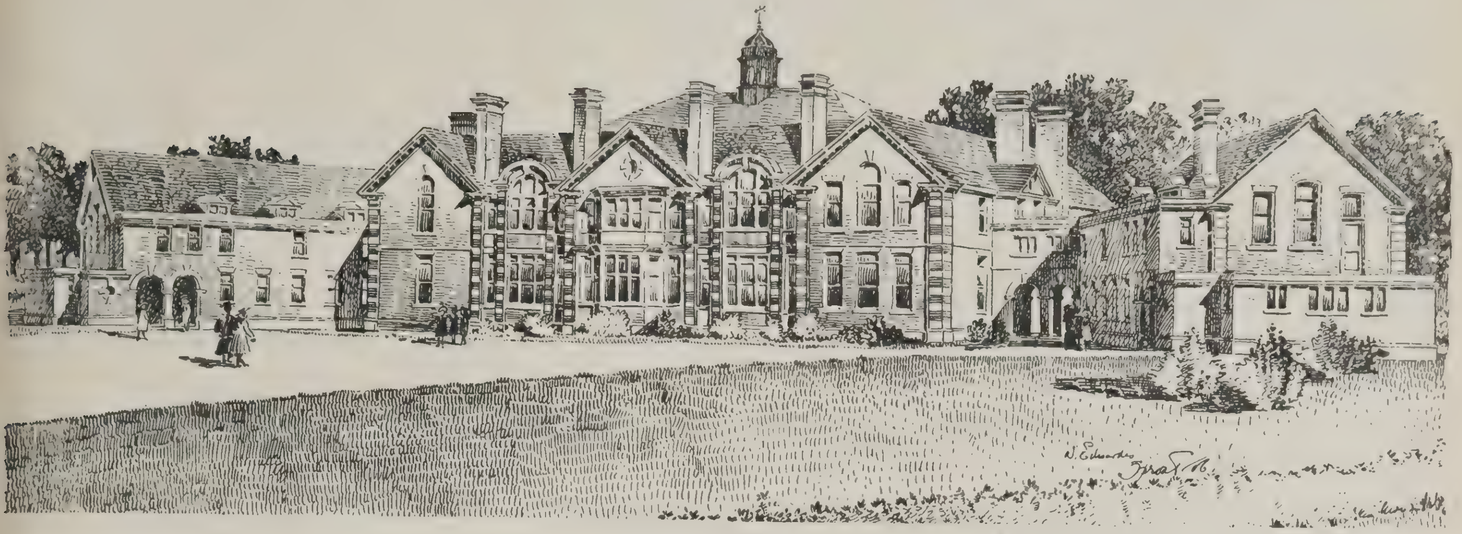
Block Plan of First-Premiated Design. Grayson and Ould, Architects.

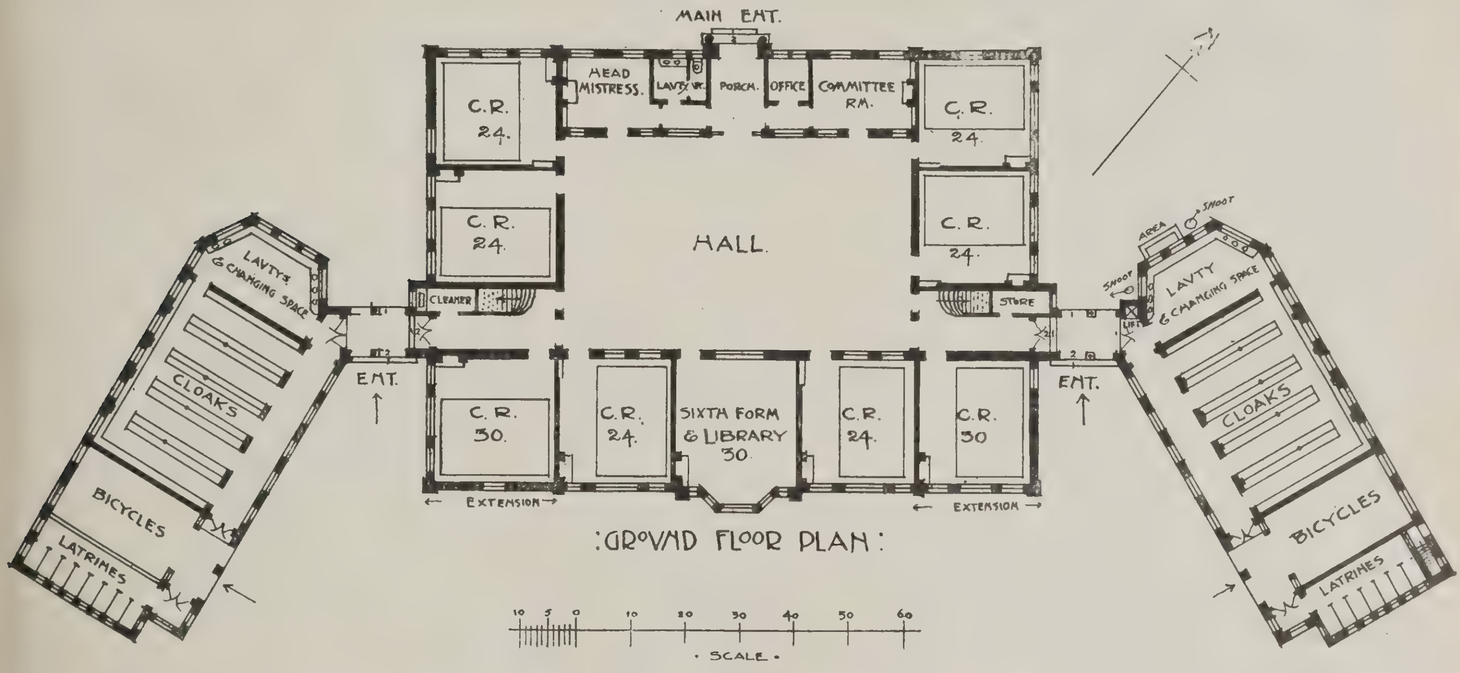


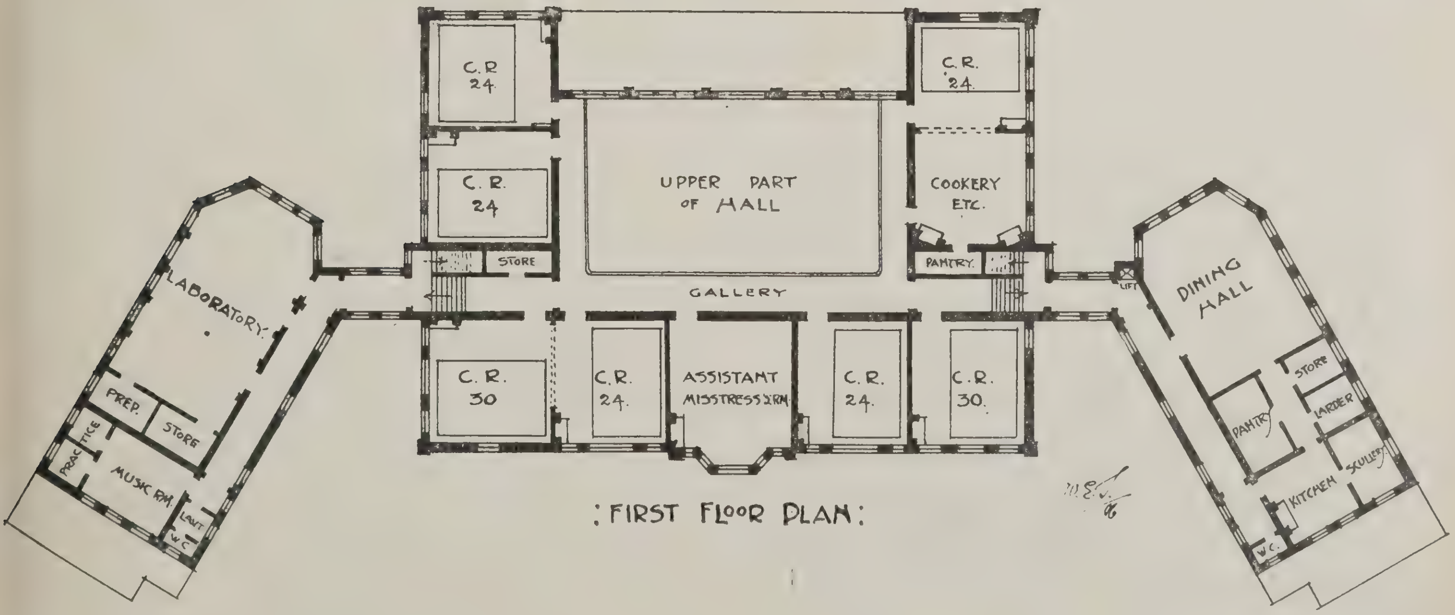
Block Plan of Second-Premiated Design. Appleyard and Quiggin, Architects.



Block Plan of Third-Premiated Design. Willink and Thicknesse, Architects.







GIRLS' SECONDARY SCHOOL, AIGBURTH VALE, LIVERPOOL: FIRST-PREMIATED DESIGN. GRAYSON AND OULD, ARCHITECTS.

THE BRADFORD CITY ARCHITECT'S DEPARTMENT.

A statement presented to the Finance Committee of the Bradford City Council relating to the cost of the City Architect's department, as compared with what the ordinary charges for the same work would have been if private firms had been employed, has given rise to some comment. The statement was that "the charge for the work which the City Architect (Mr. F. E. P. Edwards, A.R.I.B.A.) has done would average £3,202 a year for the five years he has been here if the work had been done by private firms, while his costs have been only £1,630 a year, thus making a saving to the Corporation of £1,573 a year."

Commenting on this, "A Bradford Architect" writes to the "Yorkshire Daily Observer" as follows: "Now, the annual charge of £3,202 payable to outsiders represents, on the basis of 5 per cent. commission, an average capital expenditure of £64,060 per annum, or, for the five years, a total of £320,300! What have we got to show for all this money? . . . The City Architect had nothing to do with the Cartwright Hall. That was done by Mr. Simpson. His department is credited with the plans of the Exhibition buildings—assisted by a Bradford architect—but those who could read this architect's 'writing on the wall' could not see much else. His department had nothing to do with the Fire Brigade Station, the enlargement of the Poor-law Offices, the Workhouse extension, the Rawson Square Markets, or any of the very large schools that have been built during the last five years. These have all been done by Bradford architects. . . . What buildings have been completed by the City Architect's department to represent this £320,300? The Morley Street Central Baths—assisted by a London bath expert architect, two or three district baths, a crematorium, the Exhibition buildings—assisted by a well-known Bradford architect; the Town Hall extension—assisted by Mr. Norman Shaw, architect; the famous colony of Faxfleet houses. . . . The one thing admitted that we may for the present take as correct is that £1,630 is the average annual cost of the City Architect's department, and that for these five years £8,150 has been its cost to the town. This on a 5 per cent. basis represents a capital expenditure of £163,000. Where are the buildings which even this sum represents, to say nothing of the extraordinary £320,300? . . ."

Notes and News

Toynbee Hall has just issued its "Educational Plans" for the forthcoming session, which opens on October 1st.

Mr. William Goldstraw, for many years building surveyor to the Liverpool City Council, is to retire on £366 a year.

A New Girls' High School at Leeds has been erected from designs by Messrs. Chorley, Connon & Chorley, architects, of Leeds.

Northampton Institute, Clerkenwell.—The "Announcements" for the session 1906-7 have been issued. Full courses in the crafts and trades allied to building and architecture are included.

L.C.C. Camberwell School of Arts and Crafts.—The tenth session begins on Sept. 24th. Evening classes are given in architecture, building construction, &c.; full particulars can be seen in the prospectus.

Junior Institution of Engineers. — Mr. William B. Bryan, Chief Engineer to the Metropolitan Water Board, has been elected president of the Junior Institution of Engineers for the ensuing session, in succession to Mr. Dugald Clerk.

The L.C.C. School of Building, at Ferndale Road, Brixton, opens its next session on September 24th. The principal of the school is Mr. F. W. Richards, and the director of architectural studies Prof. Beresford Pite, with Mr J. B. Fulton as assistant.

Public Slaughter-houses are to be erected by the Central Markets Committee at the Metropolitan Market, Islington. The new buildings, which will be the most up-to-date in the kingdom, will cost about £40,000. Excavations are now in progress on the site.

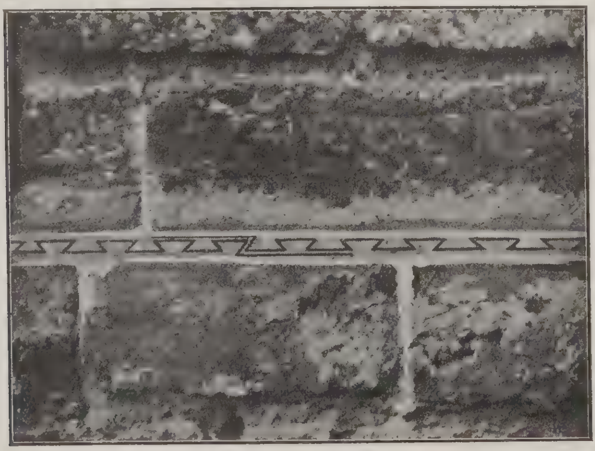
A Municipal Art School for Edinburgh is proposed. It is suggested that the school should be erected on the cattle market site at Lauriston Place, which the Town Council are willing to give for its erection. Plans have been prepared by Mr. Pittendre MacGillivray, R.S.A., and Mr. Morham, the City Architect.

New Premises in Huddersfield have been erected for the Huddersfield Industrial Society, Ltd., from designs by Mr. Joseph Berry, architect, of Huddersfield. The building faces Buxton Road, and has cost about £10,000. In the basement are a restaurant, a commercial room, smoke-room, kitchen, &c.; on the ground floor are furniture, boot and shoe, confectionery and chemist's departments, with an arcade in the centre leading to the Victoria Hall; on the first floor are showrooms for various departments, while on the second floor are stock-rooms; the attic being used as a workshop.

Trade and Craft.

A New Damp-course.

There are many damp-courses on the market, most of them consisting of bitumen in some form or another—as sheets, or laid with the trowel *in situ* like mortar. There are also, of course, the familiar stoneware, tile and slate damp-courses. A new damp-course, however, has just been introduced which embodies quite a novel principle. We illustrate it somewhat fully on this page. This damp-course consists of an aggregate piece of steel which is embedded in cement, as shown in Fig. 1. The protection which cement gives to iron is well known, and reinforced concrete work has shown it to be lasting. The preservative action of Portland cement is the same as lime—namely, its alkalinity, and as regards the protection which lime affords, we need only refer to the fact of iron dowels having been removed from mortar after very many years without the slightest trace of rust being apparent. For instance, Viollet de Duc, the eminent French architect, took some iron dowels out of Notre Dame, Paris, which must have been embedded in lime concrete or mortar for more than 300 years. They were found to be as bright as on the day they were inserted. This new "Dovetail Corrugated" steel sheet damp-course is supplied by the Fireproof Co., Ltd., of 10, York Buildings, Adelphi, London, in sheets 5ft. long, and in all widths from $4\frac{1}{2}$ins. upwards. For a distance of 3ins. the ends of the sheets are made plain, so as to serve for lap joints (see Fig. 2 and Fig. 3; the latter illustration shows the method of lapping the sheets at a corner joint). The method of using this damp-course is simply to cover the wall with a layer of cement about $\frac{5}{16}$in. thick and to lay the sheet upon it, pressing it well into the cement. The upper surface is then covered with a layer of about equal thickness, and the damp-course is complete. This damp-course has the advantage of being quickly and cheaply laid, with no liability to squeeze out or crack.



A NEW STEEL AND CEMENT DAMP-COURSE.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Sept. 20. Greenodd.—*Erection of a house at Greenodd*, for Dr. Hawksworth. Plans and specifications may be seen and quantities obtained at the office of Settle & Brundrit, A.R.I B.A., architects, Ulverston and Barrow-in-Furness. Sealed tenders, endorsed "House, Greenodd," to be delivered at the office of the architects, not later than noon, Sept. 20.

Sept. 21. Rhydfendigaid.—*Reconstructing Calvinistic Methodist Chapel.* Plans and specifications may be seen with J. Arthur Jones, architect, Cambrian Chambers, Aberystwyth, or upon application to Mr. J. Rees, Council Schoolhouse, Pontrhydfendigaid, to whom sealed tenders are to be delivered not later than Sept. 21.

Sept. 21. London, N.—*Erection of a new sorting office* at Mill Hill, N. Drawings, specifications, and a copy of the conditions and form of contract may be seen on application to Mr. J. Wager, H.M. Office of Works, Westminster. Bills of quantities and forms of tender may be obtained from the Secretary on payment of one guinea, and tenders to be delivered to him before 12 noon on Sept. 21, endorsed "Tender for Mill Hill Sorting Office."

Sept. 21. Nelson.—*Following work required in connection with the erection of brickmaking plant at the Refuse Destructor Works in Charles Street*:—1.—Steel work. 2.—Joiner's work 3.—Glazier's work. 4.—Slater's work, for the Health Committee. Plans and specifications may be seen and forms of tenders obtained on application at the office of B. Balt, A.M.I.C.E., borough engineer and surveyor. Tenders, endorsed "Brickmaking plant, —— work," to be sent to J. H. Baldwick, town clerk, Town Hall, Nelson, not later than noon on Sept. 21.

Sept. 21. London, W.—*Re-erection of a lodge* at Wormwood Scrubs, W., for the L.C.C. Drawings may be inspected, and specifications, bills of quantities, form of tender, and other particulars obtained at the Architect's Department, 15, Pall Mall East, S.W., upon payment of 10s., which amount will be returned to the tenderer, provided he shall have sent in a bona fide tender. Fair wages clause. Tenders to be delivered at the County Hall, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for the Re-erection of a Lodge at Wormwood Scrubs," not later than 10 a.m. on Sept. 21.

Sept. 21. London, E.—*Repairs, &c., at the mansion in the Island Gardens, Poplar*, for the L.C C. Drawings may be inspected, and specifications, bills of quantities, form of tender, and other particulars obtained at the Architect's Department, 15, Pall Mall East, S.W., upon payment of 10s., which amount will be returned to the tenderer, provided he shall have sent in a bona fide tender. Fair wages clause. Tenders to be delivered at the County Hall, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Repairs, &c., at the Mansion, The Island Gardens," not later than 10 a.m. on Sept. 21.

Sept. 22. Pontnewydd.—*Erection of a villa at Pontnewydd* for Dr. A. W. Hayles. Plans and specifications may be seen and all particulars obtained at No. 1, Chapel Street, Pontnewydd. Tenders to be delivered by Sept. 22.

Sept. 22. Broomford.—*Rebuilding the County Bridge at Broomford*, in the parish of Jacobstowe, for the Okehampton R.D.C., according to plans and specifications which may be seen at the office of S. Hooper, surveyor, Hatherleigh. Tenders, endorsed "Broomford Bridge," must be sent to S. Hawken. clerk to the Council, Okehampton, by 10 a.m. on Sept. 22.

Sept. 22. Newcastle-on-Tyne.—*Erection of a register office* for Superintendent Registrar, also for alterations to the Union Offices, Pilgrim Street. Names to be sent in by Sept. 22, to James Atkinson, clerk to the Guardians, Union Offices, 127, Pilgrim Street, Newcastle-upon-Tyne. Quantities will be forwarded in due course by the architect, Mr. A. Stockwell, 11, Pilgrim Street, Newcastle, at whose office the plans may be inspected and any further information obtained.

Sept. 22. Nordelph (Upwell).—*Conversion of house into two cottages. Drainage and sub-division of yard and buildings. Fencing of grass land* at the Chapel Farm House, Nordelph. Plans and specifications and conditions of contract may be seen at E. C. Warner's, at Nordelph. Tenders (in sealed envelopes) must be delivered before 10 o'clock on Sept. 22, to G. C Davies, deputy-clerk of the Norfolk County Council, 11, Prince of Wales Road, Norwich, endorsed "Nordelph—Tender." Each tender must state within what time the contractor will undertake to complete the work, as time is of importance.

Sept. 24. Raskelf.—*Erection of a farm house* at Cold Harbour, Raskelf, near Easingwold, for the Ecclesiastical Commissioners. Plans and specifications may be seen and quantities obtained with Thomas Stokes, architect, Thirsk, to whom tenders must be delivered not later than 10 a.m. on Sept. 24.

Sept. 24. Trehafod, near Pontypridd.—*Supply and erection of car-sheds at Trehafod, near Pontypridd*, for the Pontypridd U.D.C. Plans and specifications may be seen, and quantities obtained, at the office of P. R. Willoughby, engineer and surveyor to the Council, upon receipt by J. C. Jones, clerk to the Council, Municipal Buildings, Pontypridd, of a deposit of £1 1s. Sealed tenders, endorsed "Car-sheds—Buildings," must be received by J. C. Jones on or before Sept. 24.

Sept. 24. Middlesbrough.—*Erection of Wesleyan Church, Woodlands Road, Middlesbrough.* Contractors' names to Danby & Simpson, architects, 73, Albion Street, Leeds, not later than Sept. 24, when quantities and other information will be duly forwarded.

Sept. 24. Altwen.—*Erection of two shops* at Altwen for the Altwen and Pontardawe Co-operative Society, Ltd. Persons desirous of tendering can see plans, details, specification, and obtain all particulars at the offices of the architect, Herbert Street, Pontardawe, or Wind Street, Swansea. Tenders to be sent in to the secretary, Mr. Walters, Altwen, near Pontardawe, on or before Sept. 24

Sept. 25. Abergavenny.—*Alterations and additions to the Town Hall, Abergavenny.* Plans and specifications may be seen and bills of quantities obtained on payment of a deposit of £2 2s. at the offices of E. A. Johnson, F.R.I.B.A., architect, Abergavenny. Endorsed tenders to be sent to J. T. Rutherford, town clerk, not later than Sept. 25.

Sept. 25. Eyrecourt (Co. Galway).—*Erection of new schools* in Eyrecourt and Woodford, Co. Galway, for the Sisters of Mercy. Plans and specifications can be seen at the Convents of Mercy, Eyrecourt and Woodford, and at the office of William H. Byrne & Son, architects, 20, Suffolk Street, Dublin. Tenders to be sent in by Sept. 25.

Sept. 25. Redruth.—*Erection of a new Secondary School* at Redruth, according to plans and specifications prepared by Mr. Morley Collins, architect, Clinton Road, Redruth, at whose office the plans may be seen and all information obtained. Sealed endorsed tenders to be sent to F. R. Pascoe, secretary, Education Office, Truro, on or before Tuesday, Sept. 25.

Sept. 25. Alfreton.—*Pulling down a house and boundary walls, building new walls, and doing other work in connection therewith* at Pye Bridge in the U.D. of Alfreton. Plans may be seen and specification and other particulars may be obtained by application at the office of E. Houfton. Sealed tenders, endorsed "Widening," to be delivered at the Surveyor's Office, King Street, Alfreton, at or before 3 p.m. on Sept. 25.

Sept. 25. Brighton.—*Conversion of two rooms into one room* at The Warren Farm Schools, Rottingdean. Copy of specification and form of tender, together with any further information, can be obtained on application to Mr. E. Wright, architect to the Guardians, at the Parochial Offices, Prince's Street, Brighton, where plans may also be inspected. Sealed tenders endorsed "Tender for Conversion of Day Rooms," are to be addressed to B. Burfield, clerk to the Guardians, and delivered at the Parochial Offices by 10 a.m. on Sept. 25.

Sept. 26. Sherburn Hill.—*Erection of new premises for the Butchering Department.* Plans and specifications can be seen at the offices of the Sherburn Hill Co-operative Society, Sherburn Hill, near Durham. Sealed tenders, endorsed "New Butchering Dept.," to be delivered to T. Robson, secretary, not later than noon on Sept. 26.

Sept. 26. Drumcondra.—*Alterations and additions to the Dispensary House, Drumcondra*, in accordance with the plans and specification, which can be seen and copied at the Board-room, North Brunswick Street, Dublin, on and after Sept. 11, on lodgment of a cheque for £1. Fair wages clause. Sealed tenders will be received in the tender box here up to 12 o'clock noon on Sept. 26.

Sept. 26. Armagh.—*Erection of artisans' dwellings on Banbrook Hill*, in the city of Armagh, for the U.D.C., the clearing and laying out of the site, the construction of roads, paths, sewers, manholes, and other works in accordance with plans and specifications prepared by F. Bergin, B.E., 36, Westmoreland Street, Dublin. The plans and specifications may be seen of J. Lennon, town clerk, U.D.C. Offices, Armagh, on any day between the hours of 10 a.m. and 2 p.m., where copies of the tender form and schedule of quantities may be obtained by making a deposit of £1 1s. Tenders, accompanied by schedule of prices and containing the names and addresses of two solvent sureties willing to join in a bond for £1,000 for the due performance of the contract will be received by him up to 6 o'clock on Sept. 26. Tenders should be addressed to the presiding Chairman, and endorsed, "Tender for the erection of Artisans' Dwellings." No tender will be considered which is not on the proper form.

Sept. 27. Grays.—*Alterations at the fire station* for converting the old steam roller shed into an office for the sanitary inspector, for the U.D.C. Plan and specification may be seen at the Surveyor's office. Tenders are to be delivered to Hatten & Asplin, clerks to the Council, District Council Offices, Grays, endorsed "Tender for Alterations," by noon on Sept. 27.

Sept. 27. London, E.—*Additions and alterations in the building at the Electricity Works*, Osborn Street, Whitechapel, E. Persons tendering must submit the names and addresses of two substantial persons willing to be jointly and severally bound for the due and proper performance of the contract. Fair wages clause. The drawings may be seen and copies of the stipulations, specification, schedule, and form of tender may be obtained by applying to M. W. Jameson, A.M.Inst.C.E., borough engineer, 15, Great Alie Street, Whitechapel, E., between the hours of 10 a.m. and 12 noon, upon paying £5. Tenders, endorsed "Tenders for Additions to Electricity Buildings," should be sent to G. W. Clarke, town clerk, 15, Great Alie Street, Whitechapel, E., in the envelopes supplied, so as arrive at this office on before 12 o'clock noon on Sept. 27.

Spt. 27. Dewsbury.—*Erection of extensions to the infirmary at the workhouse.* Plans and specifications may be seen, and bills of quantities obtained, at the offices of Holtom & Fox, architects, Corporation Street, Dewsbury, on and after Sept. 15. Sealed tenders, endorsed "Infirmary Extensions," must be left at the Union Offices, not later than Sept. 27. and such tenders will be opened and considered by the Guardians on Sept. 28.

Sept. 27. Ashford.—*Building of a laundry at the schools at Ashford, Middlesex.* Copies of the specification, bills of quantities, and tender forms may be obtained, and the drawings and site inspected on application at the office of F. G. Beeching, clerk to the managers, West London District Schools, Ashford, Middlesex, between the hours of 10 a.m. and 4 p.m., accompanied by a deposit of a £5 Bank of England note. The site must be inspected. Tenders must be delivered to F. G. Beeching (as per instructions with the forms) not later than 6 p.m. on Sept. 27.

Sept. 27. Withernsea.—*Erection of an Infant School and for additions and alterations to the Council School, Withernsea*, for the Education Committee of the East Riding of Yorkshire. Plans and specifications may be seen and form of tender and copies of quantities obtained, on application to the Building Surveyor, County Hall, Beverley, upon depositing £1 1s. The plan and specification can also be seen at the Council School, Withernsea. Tenders, endorsed "Withernsea Council School," to be forwarded not later than Sept. 27 to J. Bickersteth, Clerk to the East Riding Education Authority, County Hall, Beverley.

Sept. 27. Dorchester.—*Construction of suitable furnaces for the complete combustion of the refuse of the town* in such a manner that the heat generated therefrom may be utilised for raising steam for pumping the water at the Borough Waterworks in conjunction with the existing boilers and plant. Plans and sections of the existing buildings and surroundings, together with detailed conditions for the guidance of those desirous of submitting schemes will be supplied on application to G. J. Hunt, borough engineer and surveyor, Guildhall Chambers, Dorchester, provided that a £5 Bank of England note accompanies the application as a guarantee of good faith. Schemes must be received not later than Sept. 27, endorsed "Tender for Refuse Destructor," addressed to A. G. Symonds, town clerk, 11, South Street, Dorchester.

Sept. 29. Penzance.—*Seamen's Institute at Green Street, The Quay, Penzance.* The drawings and specifications may be seen at the offices of the architect, O. Caldwell, Penzance, to whom tenders are to be sent on or before Sept. 29.

Sept. 29. Stourton.—*Providing and erecting 490 yards of creosoted redwood fencing, 6ft. high, round the new sewage disposal works at Stourton. Also separate tenders for about 9 yards of iron fencing, 5ft. high, including fixing at the works.* for the U.D.C. of Rothwell. Plans and specifications can be seen and particulars obtained at the offices of E. J. Silcock, M.I.C.E., engineer, 10, Park Row, Leeds. Sealed tenders, endorsed "Stourton Fencing" or "Iron Fencing" must be delivered to W. Dodgson, clerk to the Council, Council Offices, Rothwell, near Leeds, not later than Sept. 29.

Oct. 2. Christiania, (Norway).—*Supply and erection of a signal and point lever box at Hundalen station* on the Ofoten railway (one of the Norwegian State Railways). Tenders through agent residing in Norway to be delivered not later than Oct. 2. Apply, 10 kr. deposit, "Driftsbestyrerens Kontor, Narvik."

Oct. 3. Devizes.—*Erection of shedding*, and the whole of the other necessary works in connection with the show yard for the meeting of the Wiltshire Agricultural Association, to be held at Devizes in 1907. Specifications of the work required and forms of tender may be obtained of the Secretary of the Association, Market Lavington, Devizes, on payment of one guinea, which amount will be refunded upon receipt of a bona fide tender. Tenders to be delivered by 10 a.m. on Oct. 3, sealed and endorsed "Tender for Shedding," to the Secretary.

Oct. 3. Weymouth.—*Constructing and maintaining retaining wall about 510 feet in length, of ferro-concrete work (Hennebique's system) on the north side of the Pile Pier within the borough, filling in and levelling up between the existing pier and the intended wall, new fences, Portland stone coping, and other works* appertaining thereto. Plans, specification, and condition of contract may be seen and form of tender obtained on application at the office of W. Barlow Morgan, borough engineer, Municipal offices, Weymouth. The contractor whose tender is accepted will be required to enter into a bond with a Guarantee Assurance Company to be approved by the Council for the due performance of the contract. Tenders, enclosed in the Official envelope, sealed and endorsed "Retaining Wall Pile Pier," to be delivered to H. A. Huxtable, town clerk, Municipal Offices, Weymouth, on Oct. 3 next, by 10,30 a.m.

Oct. 4. Levenshulme.—*Erection of new Technical School*, at the rear of the Chapel Street Council School, Chapel Street, Levenshulme. Specifications, bills of quantities, and further particulars may be obtained on application to the architect, Mr. Henry Littler, 16, Ribblesdale Place, Preston, on payment of £3 3s., which will be returned on receipt of a *bona fide* tender. Tenders, endorsed "Tender for new Technical School," to be sent on or before Oct. 4, to J. Ogden Hardicker, clerk, Northern Assurance Buildings, Albert Square, Manchester.

Oct. 5. London, N.E.—*Erection of a two-storey school, manual training centre, cookery centre, caretaker's cottage, &c.*, on the Aldersbrook School site, Ingatestone-road, in the Urban District of Wanstead, Essex. Drawings and specifications may be inspected, and copies of the bills of quantities obtained at the offices of C. H. Bressy, architect, 70 and 71, Bishopsgate Street Within, E.C., upon payment of a deposit of £2. The contractor whose tender is accepted will be required to obtain the bond of an approved guarantee society in an amount equal to 25 per cent. of the amount of tender as security for the due performance of the contract. Sealed tenders, endorsed "Aldersbrook School Tender," and addressed to the Chairman, W.L.A.S.C. Council Offices, Wanstead, N.E., must be delivered before 6 p.m. on Oct. 5.

No date.—Blackpool.—*Re-flooring, painting and repairs to the plaster* of the two old blocks at the Sanatorium, New Road. Further particulars may be obtained from F. J. H. Coutts, Medical Officer of Health, Birley Street, Blackpool.

No date. Tunstall.—*New building*, for The Henry Richards Tile Works, Tunstall. Builders please apply to A. R. Wood & Son, architects, Tunstall, for particulars.

ENGINEERING.

Sept. 20. Andover.—*Erection of a steel girder and concrete bridge* near Lower Mill, Long Parish, for the R.D.C. Persons desirous of tendering may see the plans and obtain copies of the specification and bill of quantities and all requisite information on application to J. Wormald, district surveyor, the South Cottage, Andover. Sealed tenders upon the forms supplied, endorsed "Tender for Bridge," to be delivered to W. R. Graham, clerk to the R.D.C., Andover, on or before Sept. 20.

Sept. 20. Netherlands.—*Supply and delivery of the following materials:*—Contract No. 426.—Ironwork with appurtenances for two upright cocks. Contract Lit. Y. 12.—Metal superstructure for two bridges for ordinary traffic. Contract XCV.—Catch bolts, hook bolts, and cogged wheel bolts. Contract XCVI.—Ironwork with appurtenances for a water-closet. Contract XCVII.—50 buffers and 150 traction hooks. Contract XCVIII.—400 cast iron chairs. Particulars are obtainable from Mr. M. Nijhoff, at the Hague, at a cost of 2s. 6d. for contracts 426 and Lit. Y. 12, and of 1s. 8d. for the others. H.M. Consul at Rotterdam (H. Turing) reports that tenders will be received on Sept. 20 at the Colonial Office at the Hague.

Sept. 20. Norway.—*Supply of water pipes to the Bergen Railway, now in course of construction*, for the Norwegian State Railways. The description of pipes required is as follows: 470 metres 7ins. diameter (inside) cast-iron socket-pipes; 310 metres 6ins. diameter (inside) cast-iron socket-pipes; 500 metres 3ins. diameter (inside) cast-iron socket-pipes; 230 metres 2ins. diameter (inside) galvanised pipes. Tenders in sealed envelopes marked "Anbud paa Vandledningsrör," may be delivered at "Overingeniörens Kontor Nes i Hallingdal." up to Sept. 20. A copy of the general conditions of tender for supplies required by the Norwegian State Railways, and of the special conditions of tender to the Bergen Railway, in the original Norwegian, may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C. Note.—Apart from the usual Customs duties, a preference of from 10 to 15 per cent. is given to Norwegian manufacturers. In all cases of Norwegian Government contracts it is obligatory that a resident agent should act for tenderers not residing in Norway, and be responsible to the Government, but it is not necessary for the agent to be a Norwegian firm.

Sept. 24. Roumania.—*Carrying out canalisation and water supply works* in that town at the estimated cost of 8.547,401 lei (about £341,896) and 1,887,607 lei (about £75,504) respectively. Particulars may be obtained from the offices of the Municipality, Jassy. Tenders will be opened on Sept. 24, at the above offices.

Sept. 26. South Dublin.—*The maintenance and keeping in repair of the public fountains for water supply within the rural district.* The R.D.C. will meet on Sept. 26 to consider tenders. Specification and schedule may be seen at the Council's offices, 1, James's Street, Dublin, where also forms of tender may be obtained. Sealed and endorsed tenders must be lodged with the Clerk of the Council not later than 11 a.m. on Sept. 26.

Sept. 26. Rose Grove, near Burnley.—*Widening of the bridge over the Leeds and Liverpool Canal at Padiham Junction*, Rose Grove, near Burnley, for the directors of the Lancs and Yorks Railway. Plans and specifications can be seen and form of tender and quantities obtained on application at the engineer's office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Widening Bridge at Rose Grove," to be in the hands of R. C. Irwin, secretary, Hunt's Bank, Manchester, not later than 10 o'clock on the morning of Sept. 26.

Sept. 28. Hemel Hempstead.—*Rebuilding of a county bridge and works of widening the main road, embracing alterations to buildings at Two Waters, Hemel Hempstead.* Persons desirous of contracting for the work may see the specifications, agreement, &c., at the County Surveyor's Offices, Hatfield, between the hours of 10 a.m. and 4 p.m., except on Saturday, when they will be on view from 10 a.m. to 12 mid-day. A copy of the specification and schedule of works and prices and a form of tender can be obtained at the county surveyor's Office upon payment of £2. 2s Sealed tenders endorsed "Tenders for New Bridge and Works at Two Waters" must be delivered to U. A. Smith, county surveyor, County Surveyor's Office, Hatfield, not later than Sept. 28. Such security for the due execution of the works as the Council may require must be given by the contractor.

Sept. 30. Zurich.—*Supply and erection of turbines and electric machinery* to the Municipal generating station at Zurich. Tenders will be opened on Sept. 30 at the "Stadtischer Bauvorstand II."

Oct. 1. Dublin.—*Tenders for electrical plant* in good condition, at present in use but no longer required, at the Science and Art Museum and adjoining buildings in Kildare Street, Dublin, will be received up to 12 o'clock noon on Oct 1. Tenders should be addressed to the Secretary, Office of Public Works, Dublin. The plant comprises three Willans patent central-valve compound engines. mounted on same bedplate as and directly coupled to three Johnson and Phillips Kapp-type half-compounded dynamos, 112 volts by 450 amperes, 450 revolutions, with steam pipes, connections to switchboard, &c.; three positive and one negative slate switchboards, with switches, instruments, &c., and one for connection of dynamos in parallel; five Elihu Thomson meters; one Parker booster for 58 cells; one 58-cell battery and switchboard, with charging and discharging switches, resistance, &c., complete. Contractors to remove the plant and make good after removal at their own cost to the satisfaction of the Board.

Oct. 2. Chipping Campden.—*Provision, laying, and jointing of about 6,800yds. of 5-in. cast-iron pipes, 3,200yds. of 4-in. cast-iron pipes, 2,500yds. of 3-in. cast-iron pipes, and 540yds of 2-in. cast-iron pipes.* Together with all special castings, valves, and hydrants required; also for the construction of service reservoir and other works in accordance with the drawings and specifications prepared by the engineers for the R.D.C. Drawings and specification may be seen and bills of quantity and form of tender obtained at the offices of Willcox & Raikes, engineers, 63, Temple Row, Birmingham, on payment of a deposit of £3 3s. Sealed tenders, in envelopes supplied, endorsed "Moreton-in-the-Marsh Water Supply—Contract No. 1," to be delivered to O. H. New, clerk to the Council, Chipping Campden, not later than 12 o'clock noon on Oct. 2.

Oct. 31. Zagazig.—*Installation of a supply of drinking water in the town of Zagazig*, in accordance with plans and specifications to be seen at the Ministry of the Interior. Tenders made out on stamped paper, obtainable from Lieut.-Col. Western, R.E., C.M.G., Queen Anne's Chambers, Westminster, S.W., and marked "Offre pour les travaux d'installation d'eau à Zagazig," should be addressed to "S. E. le Sous-Sécrétaire d'Etat, Ministère de l'Intérieure, Cairo," where they will be received up to Oct. 31. A deposit of 10 per cent. of the estimate is required to qualify any tender. Conditions of tender, together with lists of the materials and machinery required may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

IRON AND STEEL.

Sept. 21. Malta.—*Supply of cast-iron pipes and irregular castings.* Sealed tenders will be received at the office of the Receiver-General and Director of Contracts, Valletta, up to 11 a.m. on Sept. 21. Tenders are to be accompanied with a deposit of £100, to be made in the office of the Crown Agents for the Colonies, Whitehall Gardens, London, by tenderers residing in Great Britain, not having a representative in Malta, and in the above-named office by local tenderers. Particulars, specifications, &c., may be obtained on application at the office of the Receiver-General and Director of Contracts, Valetta, or to the Crown Agents for the Colonies, Whitehall Gardens, London.

Sept. 21. Valletta.—*Supply of cast-iron pipes and irregular castings.* Tenders will be received at the office of the Receiver-General and Director of Contracts, Valletta, up to 11 a.m. on Sept. 21. Tenders are to be accompanied with a deposit of £100, to be made in the office of the Crown Agents by tenderers residing in Great Britain not having a representative in Malta, and in this office by local tenderers. The tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligations arising from his tender, even though he may not have signed a formal contract. Particulars, specifications, &c., may be obtained on application to J. Huber, Acting Receiver-General and Director of Contracts, Valletta, or to the Crown Agents for the Colonies, Whitehall Gardens, London.

Sept. 22. King's Lynn.—*Purchase of old iron and steel*, consisting of oil mill machinery, rails, chairs, scrap, &c., lying at the Alexandra Dock, all easy of access to rail or vessel. Can be viewed on application at the Alexandra and Bentinck Dock, King's Lynn, Norfolk. Tenders, marked "Old Iron," to be sent to A. G. Russell, general manager, Alexandra and Bentinck Docks, King's Lynn, Norfolk, not later than Sept. 22.

Forms of tender and all particulars can be obtained or will be sent by post, on application to J. H. Wild, solicitor, clerk to the Guardians, Union Offices, Harley Street, Hull. Fair wages clause. Tenders must be sent to Mr. Wild so as to be received not later than 10 o'clock on Oct 1.

ROADS AND CARTAGE.

Sept. 21. Helston.—*Two steam rollers for 70 days each for steam rolling certain roads* within the district for the R.D.C., and parties willing to tender for the supply of these should send full particulars, terms, &c., to A. E. Ratcliffe, clerk to the Council, Helston, not later than Sept. 21. The party whose offer may be accepted will be required to commence rolling on Oct. 29.

Sept. 21. Bodmin.—*Two 10-ton steam rollers, at per day of eight hours for about three months each, Driver, flagman, two water carts*, for the R.D.C. The contractors are to be responsible for any damage that may be done by the rollers to persons or property during the time they are engaged by the Council, and to satisfy the Council that their employees are insured against Employers' Liability risks. The rollers to commence work when and as required, and to work each day from 8 a.m. to 12 noon and from 1 p.m. to 5 p.m., and the whole of the work to be done under the direction and to the satisfaction of the Council's surveyors. Tenders, sealed and endorsed "Tenders for Steam Rolling," to be delivered to J. Pethybridge, clerk to the Council, Mount Folly, Bodmin, on or before Sept. 21.

Sept. 24. Liverpool.—*Road making and drainage* in connection with buildings now in course of erection at Olive Mount, Wavertree, according to plans and specifications to be seen at the office of the architect, E. Kirby, 5, Cook Street, Liverpool, between the hours of 10 a.m. and 5 p.m. Bills of quantities, conditions of contract, and forms of tender (upon which alone offers will be received) may be obtained at 5, Cook Street, on payment of a deposit of £2. Sealed tenders must be delivered to H. J. Hagger, vestry clerk, Parish Offices, Brownlow Hill, not later than Sept. 24.

Sept. 24. Sevenoaks.—*2,000 yards of clean local stone*, or any less quantity according to the specification prepared by the Surveyor to the Council, to be delivered otherwise than by traction engines, on or before Oct. 31, at the following depots within their district:—Seal Road, 300 yards (broken); Seal Hollow Road, 300 yards (broken); Blackhall Lane, 150 yards (broken); St. Botolph's Road, 250 yards (broken); Mt. Harry Road (East), 50 yards (broken); Hitchin Hatch Lane, 150 yards (broken); Oak Lane, 200 yards (broken); Britain's Lane, 400 yards (broken); Council's Yard, 100 yards (unbroken); Common Road, 200 yards (unbroken); Gracious Lane, 50 yards (unbroken); St. Julians, 50 yards (unbroken), for the U.D.C. Sealed tenders to be addressed to the Clerk to the Council, Urban Council Offices, Sevenoaks, and endorsed "Tender for road metal, &c." and delivered on or before Sept. 24. A sample of one cubic yard of road metal to be delivered at the Council's Yard by the same day, free of charge.

Sept. 25.—Gateshead.—*Paving, &c., the following streets (1) Pitt Street; (2) Orton Street; (3) Back Orton Street, East; (4) Back Orton Street, West.* Plans and specifications may be seen and quantities obtained at the office of N. P. Pattinson, borough engineer, Town Hall. Tenders are to be sent in, sealed and endorsed "Tenders for Street Paving," on or before 2 p.m. on Sept. 25.

Sept. 26. Stapleford.—*Completion of Bailey Street and Wellington Street, in the parish of Stapleford*, for the R.D.C. Plans and specifications can be inspected at the office of F. R. Hawley, surveyor to the Council, situate at Wood Street, Ilkeston. Tenders, marked "Stapleford Streets," must be delivered to F. W. Fox, clerk to the Council, Bank Chambers, Beastmarket Hill, Nottingham, on or before Sept. 26.

Sept. 27. London, S.E.—*Supply of 12,000 superficial feet of new 2½in. York stone paving, "Silex" brand*, for the Lambeth Metropolitan Borough Council. Forms of tender can be obtained from H. Edwards, C.E., borough engineer, 346, Kennington Road, S.E. Sealed tenders, endorsed "Tender for York Stone Paving," must be delivered at the Town Hall not later than 12 o'clock noon on Sept. 27.

Sept. 27. Romford.—*Supply of 1,500 tons of Blue Guernsey Granite broken to 1½-in. cube*, for the U.D.C. The granite to be delivered free at Romford Station at such times and in such quantities as the Council may require before March 31, 1907. A contract and bond, with sufficient sureties, will have to be entered into and given by the person or persons whose tender may be accepted. Tenders (with samples, and marked "Tender for Granite") to be sent to C. T. King. Council Offices, Romford, on forms to be obtained from the Surveyor on or before Sept. 27.

Sept. 27. Ebbw Vale.—*Widening Libanus Road and the Approach Road to Sunny Bank Houses and Mount Pleasant Road* for the U.D.C. Plan and specification may be seen and form of tender, with bill of quantities, obtained by appointment at the office of T. J. Thomas, the town surveyor. A deposit of 10s., which must be made in postal orders, will be required from each person who obtains a copy of the form of tender and bill of quantities. Tenders, enclosed in a sealed envelope, endorsed on the outside "Tender for Libanus Road Improvement," must be delivered to T. Hughes, clerk, not later than Sept. 27.

Oct. 1. Reigate.—*Supply of about 100 tons of rough Rhenish basalt or Cherbourg quartzite*, delivered carriage paid at the Workhouse, near Earlswood Station (L. B. & S. C. Ry.). Persons tendering must state how soon the material can be delivered, and send samples of same to the Master at the Workhouse, Redhill, Surrey. Tenders to be delivered to F. C. Morrison, 46, High Street, Reigate, Surrey, in sealed envelopes, endorsed outside "Tender for Stone," on or before Oct. 1.

Oct. 1. Teddington.—*Following works in connection with the making up of Munster Road*, in the Parish of Teddington, for the U.D.C. :—3,862 sup. yds. of roadway forming and metalling, 1,015 lin. yds. of kerbing, 1,015 lin. yds. of channelling, 2,312 sup. yds. of tarpaving. Plans and specifications may be seen, bills of quantities and forms of tender obtained on payment of £2 2s., on application to M. Hainsworth, surveyor, Elmfield House, Teddington. Tenders will not be considered unless made out on the forms provided. Sealed tenders, endorsed "Private Street Works," must reach G. H. Salmons, clerk, Elmfield House, Teddington, not later than noon on Oct. 1.

Oct. 2. Lewisham. S.E.—*Kerbing, channelling, and metalling the roadway and paving the footpaths with artificial stone (in separate contracts) of Saravia Road, Lewisham.* The plans and specifications may be seen and forms of tender obtained at the Town Hall, Catford (Surveyor's Department). Copies of the specification may also be had on payment of the sum of 5s. in each case, which will not be returned. The tenders must be on forms issued by the Council, enclosed in an envelope, sealed and endorsed "Tender for Saravia Road," and must be delivered by 4 o'clock on Oct. 2, at the Town Hall, and placed in the box there provided for the purpose. The works must be proceeded with immediately on acceptance of tender and execution of contract, and the contractor must employ local labour as far as practicable in carrying out the work. Fair wages clause.

Oct. 4. Bromley.—*Works of sewering, levelling, paving, metalling, channelling and making good Hayes Road.* The works will include (about)—Excavation, 3,250 cubic yds. ; hardcore, 1,620 cubic yds. ; flints (pit), 1,330 cubic yds. ; kerb, Norway granite, 1,620 lineal yds. ; channel, New Guernsey setts, 260 lineal yds. ; channel, secondhand setts, 1,070 lineal yds. ; Burgess Hill brick paving, 2,970 super. yds. ; 2-in. Hayes gravel margins, 1,460 super. yds. Plans and sections may be seen, and specifications, bills of quanties, and forms of tender obtained, at the office of the Borough Engineer, Bromley, Kent (Municipal Offices, East Street), on payment of £1 1s. at the office of the Clerk of the Bromley Rural District Council, Park House, Beckenham Lane, Bromley, Kent. Tenders, endorsed "Tender for Hayes Road," must be delivered to the Clerk of the Bromley Rural District Council, at Park House aforesaid, not later than Oct. 4.

Nov. 8. Cape Town.—*Material and labour required for laying asphalt paving* in the carriage ways of Long Street and Darling Street (between Plein Street and Castle Bridge), and for the maintenance of the same in a perfect state of repair for a period of twelve months thereafter. The total area to be paved with asphalt is approximately 34,000 superficial yards, including the tramway tracks, and it is the intention of the Council to select several kinds of asphalt for testing purposes. The concrete foundations will be provided by the Council. Specification may be seen and forms of tender and full information obtained upon application at the Offices of Davis & Soper, Agents of the Corporation of the City of Cape Town, 54, St. Mary Axe, London, E.C. Tenders, under seal and endorsed "Tender for Asphalt Paving," must be delivered to Davis & Soper, not later than 4 o'clock p.m. on Nov. 8th, and samples not later than 4 o'clock p.m. on Nov. 1. No tender will be considered unless submitted on the official form.

SANITARY.

Sept. 24. HALL'S SANITARY WASHABLE DISTEMPER

The Modern Wall Covering.

The most popular wall covering of to-day is Hall's Sanitary Washable Distemper. It works easily, sets hard and dries with a uniform surface, equal to flatted oil paint.

It is made in 73 colours, including rich dark as well as light shades.

One cwt. of Hall's Distemper mixed with water to the consistency of cream, will cover double the surface of one cwt. of pure White Lead Paint and save 40 per cent. of the cost of labour.

"Sisco" White Japan is the correct material for painting Doors, Picture Rails, and all Woodwork of rooms decorated with Hall's Distemper. "Sisco" Japan is a pure white decorators' enamel, which dries with a hard smooth lustrous surface. It lasts for many years with beauty unimpaired.

A CONCISE, CHRONOLOGICAL

History of British :: Architecture ::

CONTAINING 250 ILLUSTRATIONS ON ART PAPER

POST FREE FOR 5/- NETT

THE Congress Number of the Architectural Review is in effect the cheapest and most profusely illustrated History of British Architecture ever published, and no architect's library is complete without it.

The illustrations are not small thumb-nail sketches, but are reproductions from actual photographs of important buildings, and are in a great many cases the full size of the page—viz., 10in. × 7in.

A well-known architect who was among the first purchasers writes:—"As an excellent résumé of English Architecture from the Conquest to yesterday, or even to-day, it seems to me to be unsurpassable and absurdly cheap."

It is equal to many of the Architectural Books published at a guinea and more, except that it is not :: :: bound in cloth covers. :: ::

Copies may be obtained from any Newsagent or Railway Bookstall, or direct from

The Publisher, Technical Journals, Ltd.
6, Great New Street, Fetter Lane, London, E.C.

HANDYMAN desires Engagement on an Estate or Small Tenement Property. Use to all house repairs and collecting rents. Excellent references.—Box 2067, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

MACHINIST in want of Situation; spindle, 4-cutter and good all-round hand; good cutter maker; have had charge of plant. Good references.—Apply E. S., 12 Elmer Road, South Tottenham. 2042

MACHINIST requires situation to take charge of small plant, gas engine, 3 cutter, overhand, thicknessing and saw bench; make own cutters, sharp saws, etc.; town or country.—A.B.B., 47, Colmer Road, South Streatham. 2088

PERSPECTIVES effectively executed; general architectural drawing; moderate terms.—Claude H. Simpson, 18 Hill Top Avenue, Roundhay, Leeds. 2062

PLASTERER wants job, foreman or working; town or country; abstainer and punctual; reference if required.—W. H. Kerr, 87, Cottage Grove, Clapham, S.W. 2073

QUANTITY SURVEYOR'S ASSISTANT (21) desires RE-ENGAGEMENT, temporary or permanent; 5 years' experience; abstracting and billing; good references.—C., 3, Ballock Road, Dowanhill Road, Catford, S.E.

QUANTITY SURVEYOR'S ASSISTANT open to re-engagement, temporary or permanent; recent employers 14 years; taking off and measuring up; thoroughly experienced; terms moderate.—Apply W. H. C., 18, Calabria Road, Highbury, London, N. 2072

WORKING FOREMAN PAINTER, competent and reliable man; 25 years' experience; town or country; moderate terms, good references.—R.W., 19 Alma Square, London, N.W. 2061

YARD FOREMAN & STOREKEEPER desires engagement in a Builders' or Contractor's Yard. Thorough command over men; distance no object. Good reference. Moderate salary.—Box 2068, Builder's Journal Office, 6, Great New Street, Fetter Lane, E.C.

Drawings, Tracings &c.

AN ARTIST and DRAUGHTSMAN is prepared to undertake Architectural Drawings or Designs for manufacturing firms, either in office or at home. Perspectives, Illuminated Addresses, &c.—E.S.B., Box 1813, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

PLANS, SPECIFICATIONS and QUANTITIES prepared from sketches and notes.
Richard M. Geater,
18, Prince of Wales Road, Norwich.

QUANTITIES AND SPECIFICATIONS ESTIMATES. (Nominal fee if unsuccessful). Experienced General Assistance, Competitions, Designs, Contract, Detail, and Working Drawings—Address, Quantity Surveyors, 21, Liverpool Street, E.C.

Appointments Vacant.

AGENTS wanted throughout United Kingdom, with connection amongst builders and architects, to represent manufacturers of high-class enamels, varnishes, paints, &c., on commission.—Box 2019, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

ESTABLISHED LONDON QUANTITY SURVEYOR has a Vacancy in his office for well-educated Pupil. Architect's son preferred.—Box 2046, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

TIMEKEEPER and PRIME COST CLERK wanted for Stone works; must be smart. Write, stating previous experience, wages required and references, to Box 2083, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

WANTED a PUPIL by an Architect and Surveyor. Exceptional opportunity for a smart youth. Premium. Address Box 2,076, Builders' Journal, 6, Gt. New Street, E.C.

WANTED, JUNIOR DRAUGHTSMAN well up in detailing constructional steelwork and capable of superintending small jobs. Must be quick at figures and neat tracer. Salary, 30s.—Write "J. D. 927," Messrs. Deacon's, Leadenhall, Street, E.C.

WANTED, BUILDER'S CLERK, near Birmingham; general routine. State age; experience; and salary required.—Apply, Box 2092, Builders' Journal Office, 6, Great New Street, Fetter Lane. E.C.

Miscellaneous.

ACCURATE Quantities prepared by London Surveyor of experience, in shortest possible time. Reasonable terms. Provincial work undertaken. Jobs measured up and settled in town or country.—Surveyor, 2 Minster Road, London, N.W. 2079

CONCRETE BLOCK MACHINES.—For sale, Machines for the manufacture of Building Blocks, Heads, Sills, Copings, &c. Full particulars and prices on application.—C. & A. Musker, Ltd., Engineers Liverpool. 2031

TO BUILDERS' MERCHANTS AND OTHERS.

FOR SALE, as a going concern, the GOODWILL, STOCK, HORSES, and VANS of the old-established Business of the late Mr. GUS DAVIES, Builders' Merchant, 146/158 Weedington Road, Kentish Town, N.W.—Full particulars obtainable from Messrs. Letts Bros., Solicitors, 8 Bartlett's Buildings, Holborn Circus.

FOR SALE.—BERRY'S latest CONCRETE MOULDING MACHINE with pumps, accumulators, and all appliances; pressure, 800 to 1,000 tons. This machine can mould blocks 6 ft. × 2 ft × 12ins. deep, also flags or slabs any size required. It can also be used as a press for other purposes. The machine is new, and will be sold cheap. Can be seen working by appointment.—Address, Moulding Co. (W. Porteous & Co.), Glasgow.

SECOND-HAND OPTICAL MART for the Purchase and Sale of LEVELS, THEODOLITES, DRAWING INSTRS.—Clarkson's, 338, High Holborn, London, W.C. (opposite Gray's Inn Road).

TO ARCHITECTS' ASSISTANTS.—Having been appointed representative of one of the largest and best Life Assurance Offices, I am willing to allow my fellow-assistants benefit of full commission, which in many cases equals half the premium. District immaterial.—Box 2093, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

TO ARCHITECTS & BUILDERS.—Fire-Resisting and Soundproof Partition Slabs FOR SALE; surplus stock. cheap; tested by the B.F.P. Co.—W. S. & Sons, 76, Eldon Street House, London, E.C. 2064

WANTED.—First-class Firm to undertake Sole Selling Rights of Speciality of Wall Linings.—Write Box 2065, Builders' Journal Office, 6, Great New Street, London, E.C.

WANTED TO PURCHASE No. 13 of The ARCHITECTURAL REVIEW.—Box W., Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

WANTED, OLD SPECIFICATIONS of recent date relating to large structures or public buildings.—Address, "J.," Room 366, No. 329, High Holborn, London, W.C.

6/6 OFFERED for "Building News," January-June, 1896, inclusive.—W. H. Buck, North Street, Horsham.

SEE PAGES XXIII AND XXIV FOR EMPLOYMENT REGISTER.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.

September 19, 1906.

CONTRACTORS' SUPPLEMENT (MONTHLY).

Labour Conditions Compared. AN article by Mr. Kennedy on "Labour Conditions in the United States" recently appeared in the "Daily Mail," in which certain points were raised which undoubtedly deserve attention. The author's sermon was intended to show how much better off the labourer is in England than in America. Mr. Kennedy overdrew the picture, but a good deal of what he said was true. In the building trade we are all familiar with the American driving system, which happily does not exist in this country. It has been tried here, and found to be a mistake. Mr. Kennedy first cites the case of the navvy in England. He calculates this class of workman to get from 5½d. to 6d. an hour, or about 4s. 7d. for a day of ten hours. In America, for the same kind of work a navvy gets from 6s. to 7s. a day. But the 4s. 7d. goes much further in England than the 7s. does in America, and this is the point of the argument. It may be taken as a fact that the American labourer gets no more benefit from his higher wages than the English labourer. Moreover, the American navvy has a very different life to the Englishman. He has to work much harder; the labour boss almost slave-drives him; so, in this, the English worker can consider himself better off than the American. We are not, however, prepared to substantiate Mr. Kennedy's contention that labour masters in America are heartless, while as regards the statement that there is no Workmen's Compensation Act in America we would point out that no such Act was in force in this country until quite recent years, and the insurance which contractors make against undue burden in this respect has led to little or no change in their treatment of the men. Some contractors in the United States may be callous, but such are to be found everywhere. We do not believe that the American contractor is so regardless to life and limb as Mr. Kennedy makes him out to be, but all those concerned in the building trades in England know how reckless the ordinary workman is. There certainly seems to be a tendency in the States to take more risks than we do in this country, and this recklessness of the individual should be considered before we assert that the excess of accidents in the States is traceable to the contractor. In a previous "Contractors' Supplement" Mr. Macfarlane, of Manchester, called attention to the improved conditions under which the modern carpenter and joiner works compared with those of fifty years ago, and although the worker in the United States is required to keep up a good pace he has every aid in the saving of manual labour which modern machinery can give. It is no doubt one of the features of American work in every department that they go to excess and are worked up to such a pitch that they make work for each other, whereas just as much and more (and better) work can be done quietly in the same time by Englishmen. The workers, however, in England have gone quite far enough in their shortening of the hours of labour and the slackening of the rate of work, resulting in what has been called the "Ca'canny" principle, and we do not think that conditions of labour in England, though much better for the worker, can be held up as an example to American employers and statesmen of what to follow. There is no doubt the Americans would do better to take things easier, but in manual labour the American worker is by no means a slave.

A Reform Needed in Sub-Contracts. THE present system of dealing with sub-contractors is subject to some abuse. It is admittedly difficult to control sub-contractors, and if the architect requires the general contractor to give some surety, the contractor naturally—in dealing with the sub-contractors upon whom he, in turn, has to rely—desires to have some guarantee that their work should be thoroughly reliable and in conformity with the terms of the contract. The architect secures some reliability in the work of the contractor by stipulating in the general conditions for money to be retained until the completion of the job, or a stated period after. This means that the contractor has to lock up a good deal of money on a large job, and he usually obtains this money as a loan from bankers or others, upon which interest must be paid. Very few contractors could afford to wait until the completion of a job before receiving any payment at all, and they obtain draws on the certificates of the architects granted during the progress of the work. The certificates, of course, always amount to less than the value of the work actually done at any moment. As it is difficult for the architect to be very certain of the amount actually done throughout the progress of any job, much more money is kept back than actually should be under the terms of the contract. Of course, as soon as the job is finished. the contractor gets paid the correct percentage of the full payment, the remainder being the final retention money. The sub-contractors in practice, as recognised in the "Sub-contract of Building Work" issued by the Institute of Builders, are entitled to the same rate of payment as the general contractors. It is expressly stated that the final balance shall only be payable as, and when, the contractors receive their final payment. This is all very well in the majority of cases where the sub-contractors come upon a building towards the end of the job, such, for instance, as installing the lifts, supplying the joinery, partitions, plastering, marble work and painting, glazing and other finishings, because their work becomes completed approximately at the same time as the general contractors, and they are all in the same boat as regards the final payment from the building owner, but with several other trades it is obvious that the sub-contractor can be unfairly treated, and even if he goes into the job with his eyes open, it is an illogical state of affairs. For instance, supposing that the foundations are let to a sub-contractor. These are completed early in the course of a large building job. It may be a year or two years after the foundations are constructed before the job is finally completed. When the building is finished, the contractor, we will assume, has to wait six months before the final certificate is issued. If we apply the same period of time to the foundation work it is plain that the sub-contractor who did this part of the work should have been paid in full long before the rest of the building was finished; yet he would be obliged to wait until the final certificate before he received his payment in full. This means that he would be paying for the interest on the money borrowed or invested in the job by the general contractor. Of course, in the matter of foundations it may be argued that until the building is finally completed, and six months have passed, defects in the foundations will not become apparent, but it is plain that it will be too late then to remedy such defects without exceeding the retention money. Small cracks, it is true, might require to be remedied, but any serious defects would entail a great amount of work, if not partial rebuilding. The importance of the foundations being well built has been recognised, and particular attention is always paid to seeing that such work is properly executed. Where the supervision is strict there is no necessity to wait for time to prove that the sub-contractors have done their work properly, and they should not be kept out of their money in the way referred to. The same thing applies to sub-contractors who carry out other important constructional work in a building such as the steel construction, concrete floors and stonework, and even the same principle applies with less force to work which is done late in the erection of a building. Such a system, if it becomes common in contracts, will mean that only firms of large capital can enter into building operations. Not only should the general contractors have substantial capital, but the sub-contractors also. There is little doubt that this feature of modern contracting is not only illogical, but has disadvantages in the way of preventing enterprise. Undoubtedly the system is much more harmful where building operations are on an enormous scale, such as in the United States. There the steel buildings can only be executed by comparatively few firms, who sublet the work to an extent beyond anything we have yet seen in this country. There this feature of contract work is a considerable evil, and we need to take care that it does not grow to be one with us. It, fortunately, has not yet got a hold on the building trade in this country, for architects generally limit the sub-contractors, with whom they deal direct, and to whom they grant special certificates for presentation to the general contractor immediately their work is completed, and the other sub-contractors generally being labour men, are of small capital and must be paid up close.

The Month's Trade

Reports by our Special Correspondents.

THE STONE, GRANITE AND MARBLE TRADES.

In these trades the improvement which was shown in the previous month continued last month, except as regards the granite industry, which still continued to be very quiet and, if anything, worse than a year ago. The limestone and sandstone quarries were better employed than a month and a year ago. This very small improvement has continued now for a few months, and it is evident that trade is gradually improving.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of August, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
104,548	93,244	108,243	£109,757	£103,608	£115,935

THE CLAY-WORKING INDUSTRY.

The slight improvement that has now been noticeable for the last three months in the brick and tile trades happily still continues. After such a depression as these trades have been through, it is only natural to expect the employment can only be called moderate, but the fact that it is better than a month ago and a year ago is all that we could legitimately wish for. Last month we stated that it seemed that the continuance of the improved state of affairs points to the improvement being more than a seasonable one, and the addition of another month to the record tends to confirm this supposition, and nothing at the moment seems to disturb the promise of brighter things.

The brick trade at Manchester is prosperous. The local brickworks seem hardly capable of coping with the demand for common bricks which realise £1 per 1,000, although all are in full working order. It is estimated that the year's output will amount to 200,000,000 bricks.

Some of the Fletton firms are doing good business. It is stated that the London Brick Co. has just secured the contract for 4½ million bricks for the new Muswell Hill Reservoir, and a second one of six million for the G.N. Railway extension from Enfield to Welwyn. At no period of the year has trade in the Peterborough district been brisker than during August.

THE PORTLAND CEMENT TRADE.

Although as is usual at this season of the year demand has shown some slight signs of slackening in the home section, manufacturers are holding to the recently advanced prices, for they are convinced that the volume of trade in this country is going to rapidly increase at an early date, while the pressure to supply for export is as great as it was two or three months ago. It is now the opinion of those best able to judge that the use of Portland cement not only in this country but throughout the world is expanding very rapidly, and although, as is usual under such conditions, every effort will doubtless be made to increase supplies, yet it must be a long time before the output of new mills is available. Meanwhile, prices even at the advanced level are very considerably below quotations of a few years ago, and so long as manufacturers are content with a fair margin of profit they will not find buyers unwilling to meet the changed position. It should also be borne in mind that the recent improvement in prices only brings them to the level of a year ago, while owing to the rise in the price of many articles which enter into the cost of manufacturing cement, we doubt whether the manufacturer will find that he has increased his margin to any material extent. On the whole the market for Portland cement may be considered in a healthy state with a prospect of future improvement.

The returns of imports and exports of cement for building and engineering purposes for August, 1906, as compared with the same month in 1904 and 1905 are as follows:—

IMPORTS.

	1904.	1905.	1906.
Tons - -	24,499	22,912	14,382
Value - -	£35,171	29,172	18,560

EXPORTS.

	1904.	1905.	1906.
Tons - -	32,090	39,403	68,075
Value - -	£52,729	62,625	102,058

The report of the directors of the Associated Portland Cement Manufacturers (1900), Limited, for the year to June 30th last, which is to be submitted to the shareholders at the seventh ordinary general meeting of the company to be held to-day, shows a profit of £335,462, after deductions, including £110,334 for repairs and renewals, which, with the balance brought forward from last year of £13,187, amounts to £348,649. After deducting managing directors' remuneration and directors' and trustees' fees, £17,198; debenture stock, mortgage and other interest, £137,512; sinking funds, depreciation and reserves, £33,502; and bad debts reserve, £4,000, the directors recommend the payment of a final dividend on the preference shares at the rate of 5½ per cent. per annum, leaving £12,552 to be carried forward. It is stated that the profits of the sixth year of the company's working should have shown an increase, through various economies that have been effected in the manufacturing department, but the fall in the selling price of Portland cement, which continued until quite recently, has, unfortunately, more than counterbalanced those economies. It is recommended that a sum of £25,000 be carried to the general reserve and depreciation account as was done last year. That account will then amount to £120,000. The total charge for the year for sinking funds, depreciation and reserve (including the amount written off patents, but exclusive of the reserve for bad debts) would then be £58,502 9s. 9d. The total amount of debenture stock purchased by the trustees under the provisions of the trust deed has been increased during the year by £15,564. It now stands at £78,449. The company's 4½ per cent. debenture stock has been increased by the further issue of £32,400, the proceeds of which have been employed in replacing working capital which had been used to reduce the mortgage indebtedness. From this source, from sales of property, and from revenue, the total reduction, for the year, of mortgage indebtedness is £57,100.

The Belgian Consul at Manila, in the Philippines, states that large quantities of Portland cement will be required in the construction of new railways for which concessions have recently been granted. It is said that the concessionaires propose to invite public tenders for the supply of the cement needed.

THE IRON AND STEEL TRADES.

We had last month to report a period of monotony and dulness; the past four weeks have shown a better record. Things have improved and prices are up to their former level. The demand for structural steelwork is sluggish, it is true, but steelmakers have plenty of orders from other sources, such as the shipbuilding trade, railways, &c., and the prices for joists, angles, tees and other shapes used in building work have advanced. Whereas the price of Staffordshire common iron bars was quoted at £6 5s. in our last issue of the "Contractors' Supplement," they are now fetching £6 10s. to £6 15s. All departments of finished iron in the Birmingham district show an unusual steadiness. The demand for common bars and the best bars is good, but medium qualities are somewhat slack.

Corrugated sheets have difficulty in maintaining the figure they reached last month, but the present prices cannot be grumbled at.

Trade in structural shapes in Lancashire has continued good. The demand is steady and prices indeed show an upward tendency.

As regards Scotland, the absence of German competition and the continuance of a steady flow of orders has kept all the works fully employed, and prices have been maintained. The orders have, it is true, not been coming in quite at a rate equal to the output. No conclusion can be drawn from this at present.

In the North of England improvement in manufactured iron and steel and in pig-iron has been noticeable. Prices are steady again and are likely to advance.

As regards Continental material both America and Germany are full up with home orders. In fact, the latest reports go to show that manufacturers in the States will be unable to cope with their home demands and that orders may be placed in this country for structural steelwork. At any rate, both Germany and the United States leave us alone to take orders in the colonies and abroad and to supply our own market. Belgium still continues to take orders for structural steel for export at a low figure, but the steelworks are busy and everyone seems to be expecting a substantial rise in prices.

OTHER METALS.

The copper market continues strong. Prices are well maintained, and there has been something like a scramble for material for early deliveries. American advices tend to show that the consumption of copper in the United States for the present year is 20 per cent. larger than last year, whereas the output of the mines is only 6 per cent. In Germany and other European countries the consumption is considered to be larger. No wonder then that prices should be so high.

Lead has undergone increased demand and prices have still further hardened on last month.

Tin has also undergone a rise in price, though it is not so inflated as it has been.

THE TIMBER TRADE.

London Market in August.

There was some improvement in the volume of wood business in London during August. The dock deliveries still show a shortage of 2,300 standards as compared with August last year, but the overside deliveries more than counterbalance this with an improvement of 2,800 standards. The decrease for the eight months, however, as compared with the same period of 1905, averages more than 2,500 standards a month. Messrs. Churchill & Sim state that the stock now scattered amongst the three dock companies may be roughly estimated at nearly 20,000 standards less than last year. The month's importation has been a large one of deals and a small one of battens and boards. A considerable business has been effected (with a good deal of difficulty) for further goods for autumn shipment from Sweden and Russia, and a great deal more has been fruitlessly negotiated for on account of the extreme divergence of views as to prices between shippers and buyers. Shippers have continued on the lines of a very successful policy, easing off prices for unsaleable sizes and raising them continuously for the many dimensions which are in demand, so that more than one sale was effected during the month with deals and battens of the same quality at an all-over price. Buyers find it hard to follow all this with a wood trade still lagging behind the general trade of this and other countries. In many cases they have preferred to leave business alone altogether rather than pay prices on which they can see no immediate profit. They have proved too timid all through the season in this respect, and as prices gradually increase they naturally become less inclined to reverse their policy. Freights continue easily available with something less than the usual autumnal tendency to an increase of rates.

The abstract of dock stock, consumption, &c., for August, published by Messrs Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on August 31st was:—

	Pieces.
Foreign deals and ends - - -	1,625,000
Do. battens - - - -	1,778,000
Pine deals and battens - - -	731,000
Spruce do. do. - - -	705,000
Boards, rough - - - -	3,108,000
Do. prepared - - -	6,534,000

totalling 14,481,000 pieces, as against 16,615,000 in 1905, 18,284,000 in 1904, and 18,466,000 in 1903.

In other kinds the stock was as follows:—

Foreign wainscot logs - -	269 pieces.
Do. oak timber - -	663 loads.
Do. fir timber - -	5,016 do.
Do. Oregon pine, &c., spars and masts - -	4,627 do.
Colonial oak timber - -	906 do.
Do. birch timber and planks -	6,250 do.
Do. elm and ash timber -	892 do.
Do. yellow pine - -	807 do.
Do. red pine - - -	32 do.
United States pitch-pine timber	18,424 do.
Do. do. deals -	130,000 pieces.
East India teak - - -	7,152 loads.

Deliveries.

The deliveries have been—

	First eight months. Pieces.	August. Pieces.
Foreign deals and ends -	2,041,000	223,000
Do. battens - -	3,310,000	316,000
Pine deals and battens -	657,000	49,000
Spruce do. do. -	733,000	65,000
Boards, rough - -	3,260,000	304,000
Do. prepared - -	9,004,000	994,000
Total - -	19,005,000	1,951,000

The deliveries direct from ship to craft have been—

	First eight months. P.s.h.	August. P.s.h.
Deals and battens - -	72,651	18,658
Boards - - -	15,191	2,848
Total - -	87,842	21,506

Soft Woods.

Swedish Deals and Battens.—The supply of deals has been larger than it was in August last year, and it continues to be a hard task to maintain prices for them in the London market. Of battens the supply has been short, and rates have again risen. Of prepared boards the importation was a very small one indeed during August. Prices have been quite firm, and perhaps a point higher than they were in July, but the market for them has hardly responded sufficiently to the probabilities of the situation. For shipment some nominally cheap sales of deals have been made, well under current quotations. These seemed to have cleared the air, and the tendency is now towards firmness again. For Swedish whitewood also there have been signs that the limit of advancing prices has been reached for the time, and is hardly likely to be exceeded during the autumn.

Norwegian Boards.—There was a full supply of prepared boards from Norway during the month. They were much wanted, and, in the absence of the usual quantities from Sweden, prices were better than in July.

Russian Deals.—The importation from Russian ports into London was a large one throughout August—of deals nearly double that of last year, and of battens also considerable. Prices for the former have been difficult to maintain, but the battens have come to a welcome market, supplementing the deficiencies of the Swedish supplies, and rates for them were better than in July. For shipment the August business was quite a small one. The quantities available are much below an average, and, knowing this, shippers are inclined to hold rather more than firmly, but buyers are indifferent and decline business.

Finnish Battens.—The August importation of battens was very short indeed, not much more than half that of August last year. Prices advanced generally during the month, and for the favourite small sizes a high level was attained, from which, however, they seem more likely to go forward than backward during the autumn and winter.

Prussian Timber.—A considerable supply of fir timber was brought in during August to London at prices which compare favourably with the existing rates of pitch-pine, but it seems to have gone so completely out of fashion that it has been neglected in the Dock ponds, and the cheaper quotations fail to tempt consumers. For foreign oak also the demand has been unsatisfactory, the high level of cost in this case supplying the reason.

Canadian Timber.—There was almost a cessation of pine deals arriving in London during August. The market remains very dead at a very high level of price, which there is not business enough to disturb one way or the other. It is governed by questions of supply and demand on the other side of the Atlantic, with which we have very little to do. Of spruce deals there has been a full arrival from the St. Lawrence, but a complete shortage from the New Brunswick and Nova Scotian ports. Business has been again difficult at shippers' ideas of value, and for the time being stocks are held for more than buyers will yet pay. There is a better demand about for birch timber and planks, for which the values have been very depressed by the large quantities imported, but which are now showing an inclination to turn the corner. For elm and ash there is no change in the market situation or in quotations. For oak and for yellow pine timber the position has turned rather in favour of buyers. The market for sawn pitch pine timber was an interesting one during August. The slight decline in values at the shipping ports in June and July brought in buyers, and considerable sales were effected for very various destinations at rapidly increasing prices. Rates are now very high again, and buyers still unsatisfied; but the volume of business is checked for the time by lack of further supplies at any level on which they dare venture. Of pitch pine deals the supply has been something more than normal of late though chiefly in common qualities. Prices which were so largely inflated by the previous cessation of supplies are now tending towards a more reasonable level.

Hard Woods.

Teak.—Messrs. Denny, Mott & Dickson, Ltd., report that the landings in the docks in London during August consisted of 205 loads of logs and 95 loads of planks and scantlings, or a total of 300 loads, as against 957 loads for the corresponding month of last year. The deliveries into consumption were 489 loads of logs and 251 loads of planks and scantlings—together 740 loads, as against 387 loads for August, 1905. The figures indicate clearly the restricted state of the market. Prices nevertheless have again stiffened, owing to the requirements at the shipbuilding rivers absorbing most of the available floating supplies, whilst advices from Burmah and Siam continue to point to this season's

Abstract of Stock, Consumption, &c., in London Docks, for August.

supplies from the forests being disappointly small. The position will be clearer towards the close of the year.

Mahogany.—This market has been very restricted, owing to the short supplies. Prices have stiffened, owing to the very small stocks; but now that Honduras shipments are coming into sight, and the African supplies also promising to be appreciable, broader all round business should mark the remainder of the year.

Our Consul at Valdivia, Chile, reports that owing to the high price of timber at this town saw mills have been established in the district and there have consequently been some enquiries for engines and saw mills.

Our Consul at Chiengrai, Siam, reports that there is much excellent timber *other than teak* in the new province of Muang, on the felling of which, as is the case throughout Siam, no restriction is placed by the Siamese Government. Large numbers of valuable trees are constantly burned by the hill tribes in making their plantations. At present there is an entire lack of any persons who make a business of either felling or sawing timber, which is consequently difficult to obtain; so much that the local authorities have up to now been unable to commence the new Government buildings, for which funds were sanctioned some time back.

THE WALLPAPER TRADE.

The wallpaper trade shows little or no movement. The Board of Trade returns of exports and imports for the eight months of this year ending August 31st show that the importation of paperhangings is slightly larger than last year; the exports have also improved little, as compared with 1904, but distinctly better than last year.

The following is the return of paperhangings for August:—

IMPORTS.

	1904.	1905.	1906.
Cwts. - -	—	1,627	1,938
Value - -	—	£4,916	6,189

EXPORTS.

	1904.	1905.	1906.
Cwts. - -	5,565	4,894	6,851
Value - -	£12,821	12,361	15,552

THE PAINT TRADES.

The paint trades continue fair. As regards materials, the returns for imports and exports for August, 1906, as compared with the same month in 1904 and 1905, are as follows:—

IMPORTS.

	Cwts.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.
White lead - - - - - - - -	24.185	24,940	24,306	£18,919	19,970	22,666

THE GLASS TRADE.

The glass trade continues fair.

The returns for imports and exports of glass for the month of August, 1906, as compared with the same month in 1904 and 1905, are as follows:—

IMPORTS.

	Cwts.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.
Window and German Sheet, including shades and cylinders	82,943	122,453	103,736	£50,970	73,903	59,932

Plate - - - - - - - -	6,643	9,939	9,703	11,389	12,516	14,648

Our Consul at Nagasaki reports a noticeable increase in the import of glass at that port last year. It is due, he says, to the growing use by the Japanese of window glass for their houses. Most of it is of the fourth quality, and Belgium is the chief source of supply.

Builders' Notes.

A building trades' exhibition at Newcastle-on-Tyne was opened on Saturday last.

Gloucester Joinery Co., Limited.—The sixth annual report of this company states that the nett profits for the past year allow a dividend of 7 per cent. free of income tax, and placing £40 to the reserve fund.

Fall of a Girder: Fatal Accident.—While alterations were being carried out in a jeweller's shop in Great Market Place, Nottingham, last week, a heavy girder fell upon one of the labourers, who was so severely injured that he died soon afterwards.

Trade Unions Parliamentary Committee.—The only representative of the building trades on this committee, appointed at the recent Trade Union Congress at Liverpool, is Mr. F. Chandler (Carpenters and Joiners). In all, the committee comprises twelve members.

Manchester Bricklayers' Dispute.—A dispute has occurred between Messrs. Robert Neill & Sons, contractors, and the bricklayers employed by them on the new infirmary at Blackley. The men asked for an allowance for the time occupied in getting to their work, and, being refused, struck work. The society has also withdrawn their bricklayers from other works in which the firm in question are engaged.

Condition of Dantzig Building Trade.—Our Consul remarks on the activity shown in the building trade in the Dantzig district. Building materials, such as stone, cement, firebrick, tar, pitch, and roofing materials were imported into Dantzig in 1905 in large quantities both from the interior and by sea; 2,018 tons of asphalt, 782 tons of firebrick, 216 tons of fireclay goods, 182 tons of stone, 605 tons of tar, and 100 tons of pitch coming from the United Kingdom. Most of the cement for building, brought by sea, came from Pomerania, which sent 15,703 tons; most of the stone came from Sweden and Norway, which sent 50,038 tons.

Building in Coventry is brisk. Since the beginning of last year much ground in the city has been covered with houses, and hundreds are in course of erection. On all sides land is being rapidly developed and the new dwellings occupied as soon as habitable.

Scottish Building Trade.—The twelfth annual general meeting of the Scottish Building Trades Federation was held in Edinburgh on September 7th, Mr. Patrick Knox (president) occupying the chair. Reports were presented as to the state of trade in the different places. These indicated that the building trade was in a very depressed condition generally. Office-bearers for the ensuing year were elected, Mr. Patrick Knox, of Edinburgh, being re-elected president. It was decided that the headquarters of the Federation should be permanently fixed in Edinburgh. The date of the half-yearly meeting of the executive was fixed for April next year, and the next annual meeting it was decided should be held in Dundee in September next.

Rapid Reconstruction of a Brick Chimney.—A very rapid piece of reconstruction work has been done on a brick chimney which was damaged by lightning at Elizabeth, N.J. The chimney was 90ft. high, of radial brick construction. The base was square, and the upper 65ft. was built circular, and had on the top a cast-iron ring. This iron ring was struck by lightning and split. A jagged hole was also torn out of the side of the chimney about 40ft. from the top. Repairs were at once commenced, and the upper portion of the stack was quickly taken down. Five days after the damage had been committed the bricks for the renewal arrived, and reconstruction was commenced. In three days more the work was completed and steam was raised in the boilers. The stack was struck on July 4th, and on July 13th the reconstruction was completed.

A Crane Accident.—On September 7th an inquest was held on the body of a man named Bryce who was killed by a crane accident at the works of his employers, Messrs. George Jones, Ltd., of Lionel Street, Birmingham. The accident was due to the breaking of the crane hook. A cast-iron plate weighing 59cwts. was being hoisted by the crane (a 20-ton electric travelling one), and after being raised about 2ft. from the ground the hook gave way and the plate fell on three men, one of whom, Bryce, died from the result of the injuries he received. At the inquest the foreman ironmoulder of the works said that the ordinary weight lifted by the hook was a 50-cwt. ladle, but 12 tons could be attached to it with safety. The plate in question had been lifted with the hook a few weeks previously. The hook had been in use for about 15 years, but had not been used for any specially heavy work since 1894. Mr. Henry Lea, M.I.C.E., gave evidence to the effect that he had examined the hook and found that in the lowest part, where there was the greatest tensile stress, a patch of crystallised iron existed, which would much lessen the lifting capacity of the hook. Such crystallisation might have existed when the hook was made, or it might have developed as a result of vibration. In reply to the coroner, witness said it was a very good precaution to put hooks periodically in a furnace. The jury returned a verdict of accidental death.

Builders' Current Price List of Specialities

This list is not intended to promote undercutting, and prices are subject to discounts for a quantity and for cash. Readers are advised to write for these discounts. Where prices for goods are standardised and fluctuation takes place in trade discounts, our prices have the discounts deducted. In some cases it is difficult for firms to quote prices, and we have stated where they will be pleased to send catalogues and quotations immediately on receipt of applications.

Byres.

THE architectural profession is one which has perforce to take a good deal of interest in subjects which may be considered to lie outside the wide range of its technicalities. The hospital architect has to know something of the treatment of disease; and of late much attention has been drawn to the treatment of consumptives as vitally affecting the planning of sanatoria. The subject of hygiene is perhaps more closely connected with architectural design than other branches of general knowledge, and the opinions of the medical profession are therefore always worthy of the attention of architects. An interesting outcome of the treatment of those suffering from tuberculosis or consumption is suggested in the latest medical theories on the subject, and a book by Dr. W. Pickett Turner, M.D., on the origin and extinction of this disease puts forward a proposal which may have considerable influence upon the architectural design of buildings other than hospitals or sanatoria. It may be familiar to our readers that some time ago Professor Koch expressed grave doubts as to tuberculosis among cows being of the same form as that from which humanity suffers; he did not think, therefore, that the disease could be communicated by animals to men. This theory was thoroughly investigated and disposed of, and it appears that tuberculosis is communicable. Dr. Turner, reasoning on such a basis, assumes that we derive the germs of consumption chiefly from two sources—namely, the flesh (beef) and the milk of the cow, both of which form a large part of human food. The bacilli in milk or beef may be killed by cooking; milk may be Pasteurised or passed through a germ-proof filter. So far, so good, but unfortunately, supposing we eliminate beef as a serious cause from the fact that it is almost invariably cooked, it is too much to expect that all milk will be sterilised. Dr. Turner's remedy cuts at the root of the matter by suggesting that bovine tuberculosis is preventable. He explains the manner in which the disease can be dealt with, and this is very simple. All we have to do is to provide the cow with those conditions which, in the bovine or human species, make the body fit to defy the tubercle bacillus. Dr. Turner believes that the most important of these conditions is an abundant supply of sunlight. He thinks that cowhouses should be provided with transparent roofs so as to admit the sun's rays, and that they should be properly ventilated. We have it on the authority of Dr. C. W. Saleeby, M.D., F.R.S.Edin., that it is not the wild animal, but the housed animal, that suffers from consumption. He says: "This is known to be true of the bovine species, and lately it has been proved to be true of the monkeys and many other animals at the '*Zoo.*' When these were provided with nice warm, cosy, closed cages they died of consumption, one after another; the disease disappeared when they were left to take their luck in the open air—even though its temperature was far below that of their native regions." In view of this it will be readily appreciated that the ordinary type of cowshed is extremely inefficient. Cowsheds or byres are erected on two types; one where the cows are placed in single rows along the length of the building, and the other where they stand in two rows facing or backing on each other. The latter type is, perhaps, the more common, and the cows are placed with either a feeding or dunging passage in the centre. The animals are also usually tied together in pairs. It is obvious that infection can thus be easily communicated from one animal to another. Furthermore, ventilation and lighting are generally very bad, as they are also in stables for horses. It is beginning to be recognised, however, that the horse in its wild state is a native of a dry country and accustomed to an open-air life, and that the nearer we approximate to these natural conditions the better chance there is of keeping the animal in good health. It has not been thought worth while to trouble about the cow, but we now see that it is equally, if not more, important to study these conditions in the planning of byres. It has often been stated that if a plentiful air supply is given, the animals catch colds, but this is a mistake. A small stream of cold air constitutes a draught, which causes colds, but if the whole body is immersed in a quick moving stream of cold air no ill-effects result. It has been proved that it is better that an animal should be cold through the provision of fresh air (as it would be if left out in the open) rather than that it should be kept warm by confinement in the vitiated air of an unventilated, close and noisome stable. Each animal should obtain its supply of fresh air direct, if possible, and not after it has passed along the length of a stable and become tainted by the breath of other animals or the emanations of the stable. For this reason windows should be provided to each stall, and the stall should be single. Again, in regard to the sanitation of the stable, in connection with mangers, paving, and drainage, there is much improvement to be effected; but these various details have all been well worked out for stables for horses, and it only needs to adopt the same measures in stables for cows and bullocks. The architect has not paid sufficient attention to the design of places to receive animals of all kinds, such as markets and abattoirs, and, indeed, the ordinary piggeries upon estates. The principles that have been found advantageous to health dealt with above should be followed in providing accommodation for animals of all kinds.

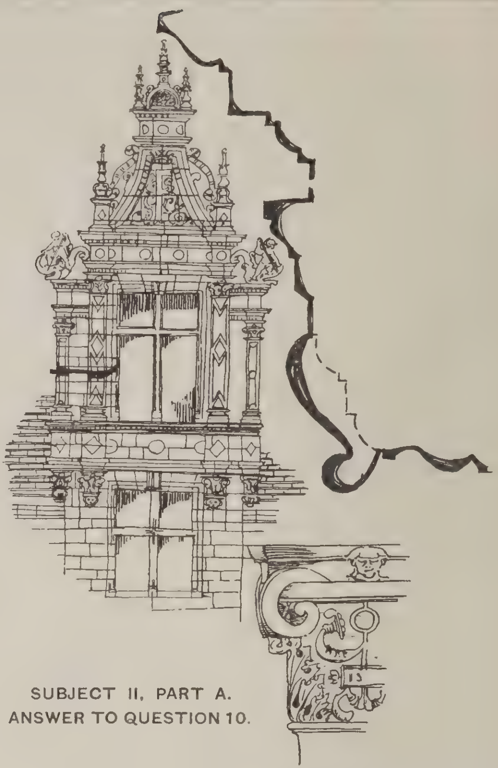
SUBJECT II, PART A. ANSWERS TO QUESTION 9.



SUBJECT II, PART A. ANSWER TO QUESTION 10.

R.I.B.A. EXAMINATIONS.

Model Answers by A. G. Bond, B.A., A.R.I.B.A.

The Final Examination.

Subject II.—THE PRINCIPAL STYLES OF ARCHITECTURE: THEIR FEATURES, MOULDINGS, AND ORNAMENT.

[*Time of examination, two hours. Maximum number of marks, 75. Every candidate in Division A to answer Question 9.*]

A.—Classic and Renaissance (continued).

9. *Sketch to a large scale various systems of fenestration in a Renaissance building, having entablature and pilaster treatment, in which it is impossible to bring the soffit of the windows below the main architrave of the building.*

There are many solutions to this problem but they can be divided into four main systems, namely:—

i. By raising the level of the main cornice where such a window occurs and treating it with a separate pediment. Fig. A, from St. Catherine's Hall, Cambridge, affords an example of such a treatment.

ii. By omitting the architrave of the main cornice between the pilasters on each side of the window in question. This is also illustrated by Fig. A.

iii. By stopping the main entablature at the window itself. This treatment would only be adopted in the case of very large windows, such as that shown in Fig. B, which is from Greenwich Hospital.

iv. By letting the main entablature run across the window and lighting the upper part of the room by a separate window, either in frieze (as Fig. C, an example from St. Mark's Library, Venice), or above cornice (as Fig. D, which is from St. Maria della Salute, Venice).

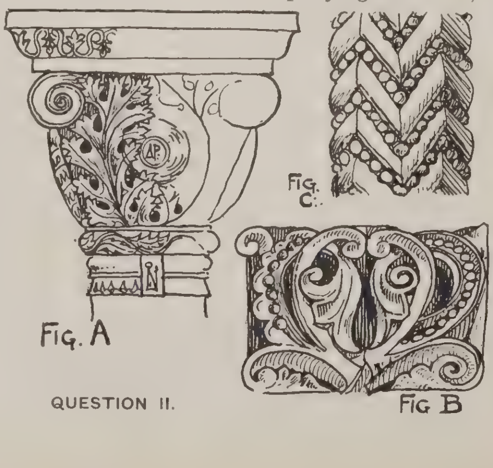
NOTE.—It was not absolutely necessary in answering the above question to give actual examples, but it would always be preferable to do so in such a case.

10. *Sketch to a large scale an enriched dormer window with pilaster treatment of French château type standing above the main cornice of the building. Show mouldings and ornament.*

The example given is a very typical one from the Château de Chambord; it is from the "keep," the main cornice being situated just below the lower window in the illustration. Details of the mouldings comprising the head of the dormer with the entablature immediately above it and of one of the capitals are given.

11. *Sketch to a large scale characteristic examples of Byzantine and Romanesque ornament.*

To a large extent the amount of work put into this question would depend on the time at the candidate's disposal. It would be well therefore to leave such a question until the last. Most candidates would find it impossible to do more than the amount indicated by the accompanying sketches, which comprise a Byzantine capital from Sta. Sophia, Constantinople (Fig. A), and two examples of English Romanesque work (Figs. B and C)—a voussoir from the west doorway of Rochester Cathedral, and part of a shaft from St. Peter's, Northampton.



QUESTION II.

B.—Medieval.

(Every candidate to answer Question 12.)

12. *Sketch, about one-quarter of full-size, three examples of stone or wood bosses of roofs.*

See illustrations: *a* is a wooden boss from the roof of Palgrave Church, Suffolk (a Perpendicular example); *b* is a Decorated example from Ely Cathedral; *c* is a Transitional example from the stone groining of the south aisle of Oxford Cathedral.

13. *Draw, full size, four examples of hood moulds to windows. Give the section of the mouldings and the carved or moulded termination.*

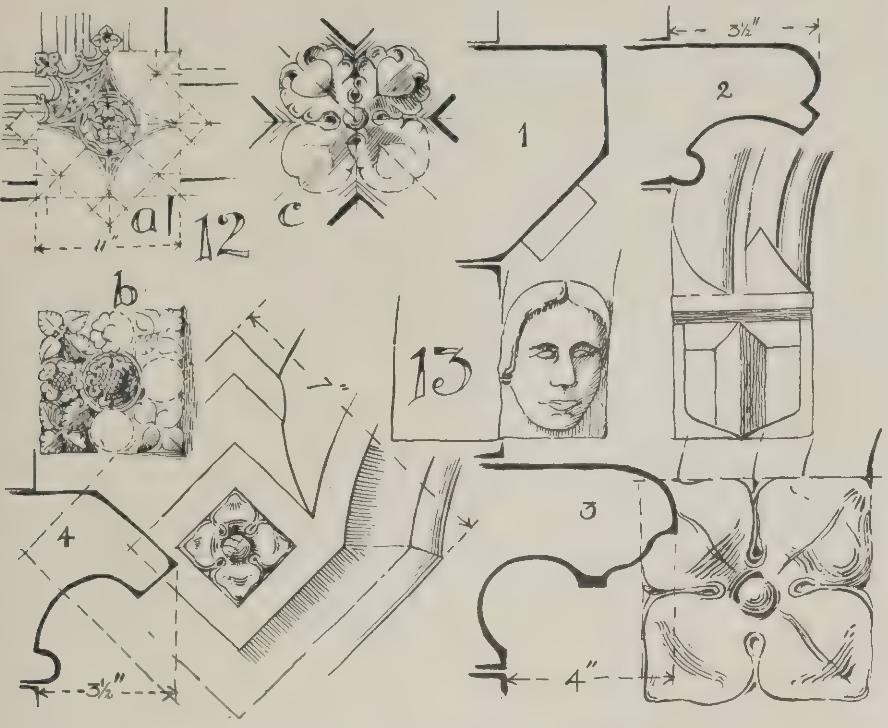
See illustrations: 1 is of Norman date, from Burnley Church, Yorks; 2 is Early English, from Barkby Church, Leics.—an example of the mask ornament which was frequently used in the earliest periods of Gothic; 3 is a Decorated example showing the typical form of the hollow moulding and the wave moulding formed by filleting the Early English form of bowtell (the stop in this case is the four-eaved flower, a common ornament of this period); 4 shows the angular form which was very commonly employed in the Perpendicular period and the most typical form of stop employed throughout the Perpendicular and Tudor periods, consisting of the label moulding returned and mitred four times upon itself so as to form a square.

14. *Draw to ½-in. scale the open timber roof of a church or hall, transverse and part longitudinal section to be given, and some of the principal details full size.*

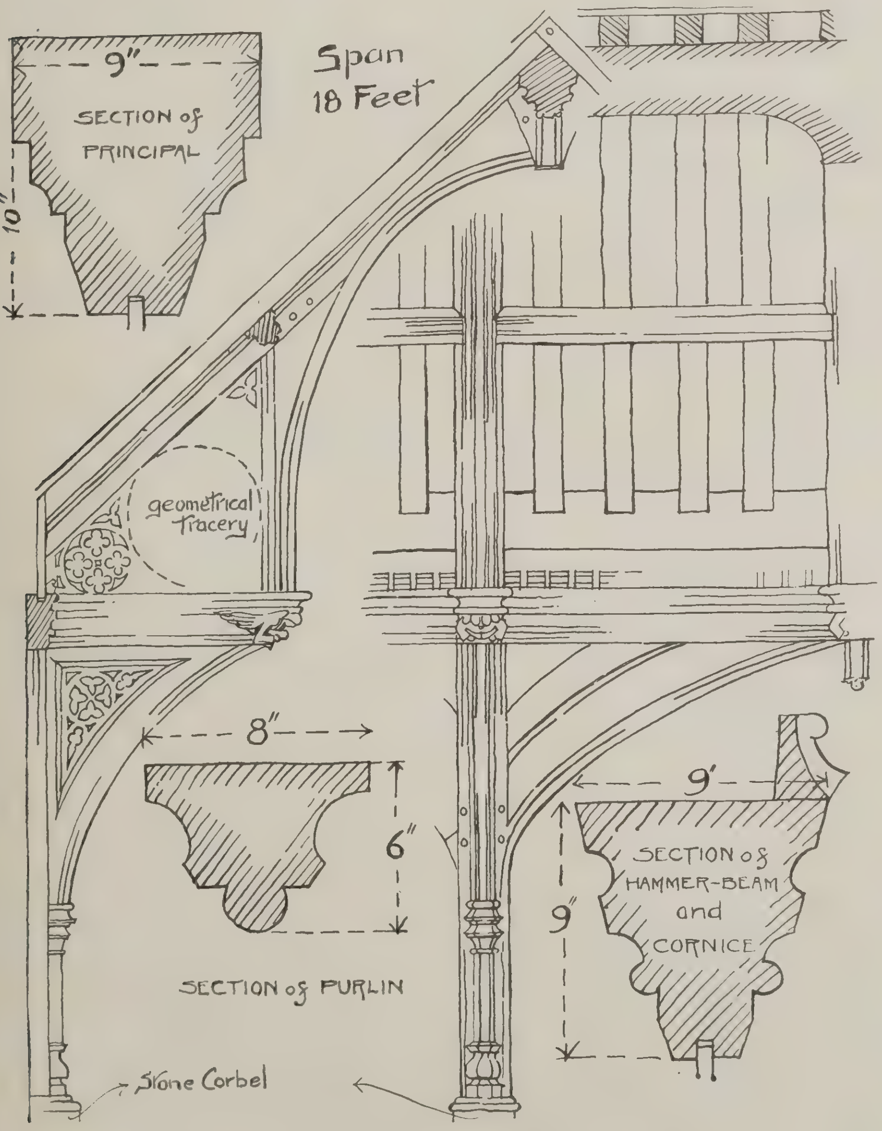
See accompanying illustration of hammer-beam roof truss from the church at Trunch, Norfolk.

(To be continued.)

[*Answers to the questions set in the Intermediate Examination were given in our issues for July 11th, July 25th and August 8th last, and to Subject I. and part of Subject II. of the Final Examination in the issue for September 5th.*]



SUBJECT II. PART B. ANSWERS TO QUESTIONS 12 AND 13.



SUBJECT II., PART B. ANSWER TO QUESTION 14.
R.I.B.A. FINAL EXAMINATION, 1906.

TIMBER CHURCHES IN NORWAY.

At one time there were no fewer than 700 timber churches in Norway, but only 24 now exist—fantastic relics of many centuries ago. The first impression suggests Chinese influence; but, in reality, there has been nothing of the kind, the churches being simply a Norwegian development of the Romanesque basilican plan. There is the usual nave, chancel and apse, but a novel feature is the open passage—the "svalgang"—round about the whole. This is no doubt an adaptation of a similar feature in domestic buildings, and served the purposes of a vestibule and a store for skis, &c., for a far-travelling public in a sparsely settled country. But whence the roof rider and dragons' heads? They also are native. The people who built these churches built viking boats, or had done so before they were converted. Now, they decorated their church gables after the manner of the prows of their ships. To detail and decoration they gave the greatest attention and care; as witness the work to be seen in the richly carved door-posts, the chairs, and other woodwork in their churches—exhibiting Celtic influence in the earliest examples, and Anglo-Saxon and Norman in the later. The construction is very solid. Large round posts are used as main supports, with tongued planks or staves between, from which the term "stave-kirke" arises. All "stave" churches date from 1000 to 1500 A.D.—that is, from the introduction of Christianity to the Reformation. They were built for the Roman Catholic ritual and have but little provision for lighting. Small holes in the clearstory permit a meagre light to filter down. The windows that show are modern, incongruous and unfortunate alterations.

The oldest church still standing is said to be one in Urnaes in Sogn, while the least restored is the church of Borgund in Laerdal: this latter dates from the 11th century, though the passage was added in the 12th. The other churches have been much altered and restored. Thus the church of Lom consists of two, pieced together, and is further disfigured with a spire and windows. The church of Fortun in Sogn has been moved to Fantoft, near Bergen, and much restored, but not always correctly: the "svalgang," with its too open postwork, has lost much of the character of stability and protection. The church of Hitterdal in Telemarken is restless and grotesque, but a notable and bold piece in spite of the very incongruous windows: it was built in the 12th century, and restored in the 50's.

The church of Hopperstad, in Sogn, dates from the 11th century, but was restored in the 60's and looks rather new.

The church of Gol is the one mostly seen by tourists, for it has been removed to Bygdoe, near Christiania, where there is an open-air museum of old Norwegian buildings. It, too, has been much restored, at the expense of King Oscar II.

It is worth noting that there are no "stave" churches outside of Norway. There are, certainly, a few remains in Sweden, just enough to show that both these peoples built on the same lines. But whereas, in Sweden, timber building gave way early to masonry, in Norway the traditions of wood construction have been carried down to the present day. It is true that after the 14th century they forgot, or neglected, to build artistic churches. But they did build dwellings and storehouses that are models of good construction well designed.

Correspondence.

Labour Conditions in London and New York Compared.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your notes on the above in last week's issue are excellent. It happens that I have just returned from a month's visit to New York—renewing an acquaintance after an absence of some years. I have had good opportunities for spending much time amongst the handicraftsmen of that city, and I do not think they are called upon to work harder than the average man in London. I have inspected many extensive workshops in New York, and the accommodation provided for the workers in them is distinctly superior to the majority of our own. It is the custom of the workers—an admirable custom—to breakfast before commencing work, which begins at 8 a.m., and, with an hour's recess at noon, is continued till 5 p.m., except on Saturdays, when work finishes at mid-day. The foremen declare that their men get through rather more work in eight hours than our own do in nine, though they generally observe that this is chiefly due to a better system of supervision and to the aid of more labour-saving machines. But in spite of this (I rather doubt its accuracy) 98 per cent. of the representatives of the building trades in New York are Europeans—born and bred—and the best of them are of British or Scandinavian birth.

Particular reference was made in your leader to the navvy, whose recognised pay in New York City is a dollar and a half a day (6s. 3d.). He is, almost without exception, Italian by birth. As to working harder than the navvy here, after extensively watching him I assert that he does not. In the enormous quarries at Carrara, where the same class of men only receive a couple of lira (1s. 7d.) a day of longer hours, I am perfectly sure the toil is more excessive.

True it is that, taking it all round, the purchasing power of a dollar (4s. 2d.) is not nearly so great in New York as it is in London—house rent especially being enormously high. But the actual necessities of life (save clothes) may be procured at about the same rate as in this country.

Strikes are the great drawback to the building trades in New York. If it were not for these, intelligent men have told me they would be infinitely better off there than in the British Isles.—Yours truly,

EXETER. HARRY HEMS.

Girls' Secondary School, Aigburth Vale, Liverpool.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your review of the competition for the above you state that according to the conditions of the competition cloakroom accommodation had to be provided for 100 juniors and 300 seniors, and that all the premiated designs wisely compromised the accommodation to 200 for each cloakroom. One naturally supposes that the Education Committee, who published these conditions, knew what they required, and did not intend 100 to mean 200, nor 300 to mean 200. Although one has every confidence in Mr. Frank G. Briggs as an assessor, is his award quite satisfactory to those competitors who, probably thinking there must be some sound reason for giving in the conditions the accommodation required in each cloakroom, worked hard to produce a plan which met those requirements, although fully realising that a more symmetrical plan could be produced by making the cloakrooms accommodate an equal number of children; this they would not do for fear that their drawings might be passed over because they did not conform with the conditions. Those who draft conditions and instructions for competitors cannot be too careful, and it should be clearly stated therein that either the conditions are to be rigidly carried out, or that they are only suggestive to enable competitors to form a general idea of what is required. When the former is the case, assessors should be instructed not to consider any designs which do not conform to the conditions.

If specific conditions are going to be ignored by assessors when making their awards, competitions will become nothing more nor less than chances, instead of fair trials to see who can produce the best solution of a problem.

I am in no way interested in this particular competition, nor do I know anything about it beyond what I have read in your paper, so my growl is not that of a disappointed competitor.—Yours truly,

SIDNEY F. HARRIS, F.R.I.B.A.

NORTHAMPTON.

Notes on Competitions

Premises for Leven Reform Co-Operative Society, Ltd.

Three weeks ago we made some comment on the conditions of the above. The competition closes this week, but it may be interesting to give the following particulars which we have received from a correspondent:—Leven is a small town about eighteen miles across the Firth of Forth from Edinburgh, and about four miles east of Wemyss, which, it will be remembered, had recently an unsatisfactory school competition. Leven's resident population is, roughly, four or five thousand, but there is a large influx of summer visitors, catering for whom is a "staple industry." The buildings recently erected mostly appear to bear the imprint of the same hand, and the same features are also evident in a number of small towns and villages in the vicinity. "It may therefore be easily judged," says our correspondent, "what success an intending competitor is likely to have—the whole county of Fife, indeed, having an unenviable reputation as far as competitions are concerned."

Free Library at Hither Green.

The Lewisham Public Libraries Committee have received designs from twelve local architects for the new library to be erected at Hither Green. The designs are now under consideration, and a report in regard to them may, perhaps, be presented at this week's meeting of the Borough Council.

Burton Police Station.

At the last meeting of the Burton Town Council a discussion took place as to the new police station which is to be erected in the borough. The General Purposes Committee brought forward a report on the matter, and Councillor Rowland, speaking on behalf of the committee, said it was thought better that the work should be put into the hands of an architect rather than be done by the borough engineer and surveyor (who, he might mention, was in agreement with the committee on this point). They also thought it best to leave it to the local architects. If they threw the competition open they would be deluged with plans, and in this connection he mentioned Swadlincote's experience in the matter of its Carnegie library, for which 87 designs had been submitted. It was decided that the committee's recommendation should be carried out.

Standard Colour Card.

Our readers will recollect that some months ago Messrs. Pinchin, Johnson & Co., Ltd., varnish, colour and paint manufacturers, of Billiter Street, E.C., instituted a competition with the object of establishing a Standard Colour Card. The competition was open to everyone, and each competitor was supplied with envelopes containing small colour slips—four slightly differing shades of 60 separate colours. From each set of four shades competitors had to select the one which they considered to be most correctly corresponding to its name—"lemon chrome" or "olive green," for example; and each slip selected was stuck down in its proper place on the card supplied. A standard card was then built up in accordance with the selections made, and the competitors whose cards were nearest to the standard were awarded the several prizes. These awards are as follows (number of votes in brackets):—

First prize (£50), William E. Taylor, Canterbury (42); second prize (£15), J. Standem Adkins, London (41); third prize (£15), Edward Y. Saunders, Barnstaple (41). Winners of £1 each:—C. H. Brightiff, Southampton (40); H. J. Capell, Clapham Common (40); C. H. Durber, Newcastle, Staffs. (40); F. J. Herbert, Newcastle-on-Tyne (40); W. Ward, Sheffield (40); R. J. Black, Ballinasloe (39); L. H. Crumpler, Wareham (39); E. A. Dyson, Tadcaster (39); F. Green, Thames Ditton (39); E. G. Hill, Minehead (39); Miss A. J. Ronald, London (39); L. Shrubsole, Maidstone (39); W. A. Webb, London (39); H. Williams, Altrincham (39). Winners of 8s. 6d. (14 share last 6 prizes of £1):—B. Bishop, Darlington (38); J. S. Cable, London (38); J. M. Davidson, Greenock (38); W. Dicken, Birkenhead (38); S. Edwards, Barnstaple (38); L. Fletcher, Wigan (38); T. Green, Thames Ditton (38); L. Judge, London (38): N. Keighley, Wakefield (38); J. L. Parker, Burton-on-Trent (38); A. G. Rhind, London (38); A. H. N. Rogers, Bolton (38); F. W. Shaw, Whitley Bay (38); W. P. Wyatt, Bognor (38).

Messrs. Pinchin, Johnson hope shortly to be able to send out their Standard Colour Card, which should be of much service.

In Praise of Competitions.

We take the following from the "American Architect" for September 15th, just to hand:—"It is our own belief that competitions are very far from being the unmitigated evil their opponents would like to have them held. A competition always is a success from the winner's standpoint, and there never was, and probably never will be, a competition so well and fairly managed as not to be declared a failure by some, if not by all, of the defeated contestants. Very much is made by opponents of the system of the vast aggregated cost of the time and labour wasted in a large public competition, as if such waste were peculiar to architectural competition, instead of being the one common element in every field of human endeavour. . . . .

The aggregate loss of a number of real-estate agents all trying to sell the same piece of property is also large, just as is that caused by the futile manœuvring of many lawyers, each trying to secure the same client. If the lawyer, the manufacturer, the architect, the real-estate broker, object to the burden that bears more or less equally on all labouring men, the remedy is entirely in their own hands. It is wholly by their own volition that they enter competitions; each, if he prefer it, can sit quietly in his office and do only such work as comes to him through and because of his acquired reputation—if he has any."

Suburban Houses, Bristol.

A competition among Bristol architects for designs of suburban houses costing from £700 to £1,000 the pair was instituted recently by the Corporation. The awards have just been made as follows:—First premium (£15 15s.), Messrs. Rowley and Norton; second premium (£10 10s.), Messrs. La Trobe and Weston; third premium (£5 5s.), Mr. P. Hartland Thomas.

List of Competitions Open.

Date of Delivery	Competition.
Sept. 28	COTTAGE HOMES AT CLEADON and receiving house at workhouse, for Guardians of South Shields Union. Particulars from J. W. Coulson, Union Offices, South Shields.
Sept. 28	SEWAGE DISPOSAL SCHEME FOR ELLESMERE. Premium of £20. Particulars from R. E. Lloyd, clerk to Urban District Council, Ellesmere.
Sept. 29	REBUILDING OF HENSHAW'S BLIND ASYLUM AT MANCHESTER. Limited to Manchester architects. Premiums £100, £50 and £25. Assessor, Mr. John Holden, F.R.I.B.A.
Sept. (last week)	PREMISES AT LEVEN, for Reform Co-operative Society, Ltd. Particulars from D. C. Wilson, secretary.
Oct 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
Oct. 20	SEWERAGE SCHEME FOR HIGHBRIDGE, Somerset. Premium £20. Particulars from W. C. Shier, Surveyor to the U.D.C., Highbridge.
Oct. 22	SCHOOL AT GAYWOOD, King's Lynn. Particulars from Secretary, County Education Office, 57, London Street, Norwich.
Oct. 31	BOURSE AT CAIRO.—Premiums of £E250 and £E100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Dec. 14	FOUNDLING HOSPITAL, MONTEVIDEO.—Four selected designs in preliminary competition to be awarded £212 each; first premium of £742 in final competition. Particulars from Consulate-General for Uruguay, 5 & 6, Clement's Inn, London, W.C.
No date	LIBRARY AT FRIBOURG, Switzerland (International competition.) Particulars from "La Direction des Travaux Publics," Fribourg.

NEW CYCLE WORKS.

Among the most recent contracts for constructional work entrusted to the St. Pancras Ironwork Co., Ltd., is that in connection with new offices and works at Redditch which have been built for the Enfield Cycle Co., Ltd. Here there is a total floor space of upwards of three acres. The east block, measuring about 300ft. in length, is devoted to the general offices and covers an area of about 10,000 sq. ft., the first floor being occupied by offices, board-room, show-room and sale department. The north side of the building is allotted to the machine shop, 214ft. by 50ft., adjoining which are frame stores, rough stores, and the view-room and finish stores—on the ground floor, with an extensive building shop on the first floor. In the centre portion the plating and polishing shops occupy the ground floor, and the enamelling and cleaning shop the first floor, covering an area of about 9,000 sq. ft. The first floor of the south wing is the largest clear area, free from walls; it is covered by 66 north light trusses in four rows, these being entirely supported by columns and providing a clear area of 22,000 sq. ft. for stores and finishing shop. The ground floor of the south wing is occupied by the stock room, 150ft. by 50ft. Along the gable ends, running from north to south wings, is a continuous balcony and bridge about 150ft. in length, from which each wing of the building is accessible from the offices. There are nine flights of staircases. Altogether the building has involved the use of between 300 and 400 tons of metal (including 172 steel trusses) and 26 timber trusses.

The work has been carried out from plans by, and under the supervision of, Mr. Francis F. Baylis, architect, of Redditch, the building contractors being Messrs. C. G. Huins & Sons, of Pool Place, Redditch.

Views and Reviews.

Mitchell's Building Construction.

The elementary course of Mitchell's "Building Construction" has now reached its seventh edition, and the advanced course its fifth. These two new editions of the work have been published at the same time, and consequently are better related to each other than before. It is evident that the books are popular. There are probably two reasons for this: first, their comparative cheapness; and, secondly, their use as text-books by the large classes at the Regent Street Polytechnic, where Mr. Mitchell is lecturer on building construction, and also headmaster of the Technical School. In former issues we have somewhat severely criticised these two books as new editions of them appeared, but, as is only natural with such a subject as building construction, the books could not be regarded as wholly bad; there is a good deal in them that can be praised, and that undoubtedly makes them worth their small cost. It is the unthankful duty of the critic, however, to find fault, and he does not feel himself relieved of his task with the new editions now before him. Primarily the deficiencies are traceable to the fact that the books have been compiled (as too many text-books are) to meet the requirements of the South Kensington examinations. As each set of papers is issued, any question that an examiner chooses to ask, if not directly answered in a text-book, seems to lead book-compilers to insert a paragraph to meet it in their next edition. In this way books grow by a steady accretion of heterogeneous items, without scheme or system. If the student knows sufficient practical construction to enable him to gain a good start in life, it matters very little whether an examiner this year or next asks the meaning of some term seldom used in the building trade or belonging to some small district. It is far more important that the student should have a sound practical knowledge than that he should lose marks by not being able to answer catch questions. The authors of what presume to be standard text-books are too often thus inclined to pursue the shadow and miss the substance. Too frequently, also, authors are teachers in schools, out of touch with current practice, and their time is so fully occupied that they cannot keep up to date or extend their knowledge. Only very few men, of course, would be able to master all the branches of building construction, and it is too much to expect Mr. Mitchell to possess a specialist's knowledge of applied mechanics and structural engineering, chemistry and physics of building operations, and all the many crafts and professions allied to architecture. It is true Mr. Mitchell has had the assistance of two of his colleagues at the Polytechnic to revise the chemical and electrical portions of his work, but this does not go far enough. In order to secure efficiency in this respect, it would be necessary for them to become part authors.

Defects are by no means so numerous in the elementary course, which consists more or less of plain, straightforward descriptions of simple things, without extended discussion of the theory and underlying principles of construction, and we can unhesitatingly recommend the elementary volume as a primer for students; but we cannot recommend the advanced course, which presumably aims at giving the student a thorough knowledge of building construction, to serve him in his future career. It is valuable as a supplementary work for consultation, but it is by no means all-sufficient for the student. In many ways it gives him a glimpse of the obvious, but it more often than not, in our opinion, sets the wrong point of view before him. It appears to be so thorough that he would be misled into supposing that it contained the whole truth, whereas often the information is wrong, or is beside the mark. In particular, the information about building materials and applied mechanics is deficient. There has been considerable improvement of recent years in constructional knowledge, and it is to be regretted that the book should not have kept pace with this advance. This is perhaps only to be expected, for it is against human nature and the interests of the publisher for a book to be entirely rewritten. That is, however, what is required to be done with Mitchell's "Building Construction," notwithstanding the attempts that have been made in this edition to bring it up to date by including the specifications of the Engineering Standards Committee, a chapter on reinforced concrete construction (which, however, is next to being useless), and the extensions in many other directions. The work, undoubtedly, should be purchased by students, but it should be regarded as supplementary to other standard books on the various branches of building construction.

"Building Construction and Drawing," by Charles F. Mitchell, assisted by George A. Mitchell. First Stage (or Elementary Course), 7th edition, price 3s.; Stages 2, 3 and Honours (Advanced and Honours Courses), 5tn edition, price 5s. 6d, London: B. T. Batsford, 94, High Holborn, W.C.

Birmingham's great electrical scheme is practically completed. The total outlay on the new power station and other developments is something like £400,000. The new power station in Summer Lane is one of the largest buildings of its kind in the country. The buildings stand on between four and five acres of ground, and the Birmingham Town Hall could with ease be placed in the engine-room. The work of erecting the new station has taken about two years.

PECULIARITIES OF WOODS THE JOINER USES.

By W. Young.

A careful, methodical mechanic can invariably save himself much unnecessary time, trouble and hard work by simply making ordinary use of the knowledge that experience has taught him of the nature of the wood he is handling—indeed, there can be no surer method of distinguishing the good from the inferior workman than by noting how they separately watch their material during the progress of their work. A careful workman, provided always sufficient time is allowed, will arrange the various details and adapt the grains of his panels and wider portions of his work so as to bring out to the greatest possible advantage all the natural perfections of the wood.

It is, in the first place, of the greatest importance that the workman who has the selecting and cutting of the material required for joinery work should be not only a joiner, and a good one at that, but should also possess a thorough knowledge of timbers, a qualification not possessed by all joiners. The slightly-increased remuneration paid such a man is more than recouped.

The loss occasioned by a careless selection results in great waste of material and men's time, ofttimes occasioning the necessity of casting out much of the material when a considerable amount of labour has been bestowed upon it before it reaches the hands of the joiner, and yet the latter will have to bear the brunt.

A considerable responsibility, therefore, rests upon the cutter out, as besides avoidance of sap, defective knots, shakes of various sorts, there are the grains of the wood to be carefully matched in cutting off for polished or stained work. **The neglect of such matching** often causes rejection of finished work by architects. In painted work, of course, matching of grains is not necessary, but for all hard wood work the grains should be so arranged as to be in the same position as the natural growth of the tree. At times in some wood it is almost impossible to detect with the eye the run of the grain, especially in wood without figure, but the joiner can readily discover it by trying with his plane on the face. It is customary with joiners when planing up their stuff to put on it when planed **the face mark,** but it is only few who put the mark determining the run of the grain, although the one mark is almost as necessary as the other. Some wood of course will smooth either way, but none so quickly or so easily as the way of grain, and it is in making use of this knowledge the good joiner will save himself much time and trouble. In fact, it is almost incredible what amount of time, consequently money, can be saved by ordinary attention being bestowed on these details, trifling to the inexperienced, especially considering the fact that builders are so frequent in their complaints as to the excessive cost over their estimates for their joiner's work. It is a great pity, even from the purely economic view of the matter, that a stricter observance of these details is not more often insisted on.

Although the occupation of a joiner cannot be classed under the head of dangerous trades, his life is a short one, the average being not more than 45 years; and in the case of the joiner continually in a shop much less, a fact easily proved by referring to death statistics published annually by the various trades unions in the woodworking industries. Doubtless this mortality is due mainly, if not entirely, to the nature of the calling. The diseases from which joiners suffer most—especially such as are constantly working on hard woods—are consumption and asthma, both of which are contracted through **inhalation of the fine dust** arising from and kept in circulation by the use of glass paper, noticeable more particularly with hand-rail hands, and especially with mahogany rails. A joiner working on such is scarcely ever free from symptoms of colds, being, from the nature of his work, compelled to bend closely over same, contracting the muscles of the chest, and thereby accentuating the evils arising from the inhalation of the dust, which in some cases is undoubtedly poisonous, and more especially so from the best qualities of mahogany, such as Spanish or Cuba, the pores of which are filled with a white chalky substance: this matter is not found in mahogany of the common sort.

Teak is another of the hard woods from which a joiner is liable to suffer, and to him it is one of the most objectionable of woods, containing, as it does, such a quantity of grit and iron, making it very hard and costly to work, taking at least double the time of any other of the hard woods, never repaying the cost of labour bestowed, besides the enormous wear it entails on the joiner's tools, the up-keep of which is a serious item to him. Another and a more serious objection is that, owing to a poisonous acid contained in teak, it is only on very rare occasions the joiner comes out of his job without some poisoned wound caused by splinters or cuts, and there is no doubt that this acid is of a very virulent nature. It is owing to its presence that teak is so largely used in good-class stable fittings, as it is well known that horses leave it severely alone after one or two attempts at gnawing. Men who are constantly engaged in working it are at times subject to **a dangerous skin disease,** and cases are by no means uncommon where men have become so permeated with the complaint that the finger nails have rotted away and paralysis has set in, supposed to be due only to the constant handling of this wood.

Walnut is, I believe, one of if not the most favourite of the hard woods with the joiner, expensive, doubtless, from all points, but it is doubtful if there is any wood which so well repays the cost of labour bestowed upon it when finished.

English oak, now very difficult to obtain owing to what amounts to the almost criminal neglect of its cultivation, is a wood not much in favour with the joiner. It entails much hard work in preparing and finishing; it is generally more or less damp, consequently strips or roughs up in the smoothing, and, owing to the great care a joiner has to keep tools from rusting, it never will become with him a favourite wood. Even with all the pains possible taken to clean up, the finish to him is never satisfactory. Riga wainscot, on the contrary, does not rust the tools nor strip in the cleaning up, and although the cost of the material exceeds either Austrian or American wainscot, it far exceeds both in appearance and value when finished.

Coming to woods of a softer description and in more general use, Archangel, Petersburg and Onega are the principal and preferable of the yellow deals, and Christiania of the white deals, and among the pines, American yellow. The last-named has now been raised to such a prohibitive price as to become almost as scarce in a joiner's shop as some hard woods; but, doubtless, of all soft woods it is the best—clean, fairly free from tendency to shakes, and few knots. It is easily distinguished by short dark, hair-like lines running in same direction as the grain. It is very easy to work, but requires great care, being so easily bruised and damaged when finished. For interior framings, panels, mouldings, &c., it would be difficult to surpass it; but the American does not mean the English joiner to partake of the luxury unless well paid for. That which would be saved in labour from the ease with which it is worked is more than lost in first cost.

Archangel, Petersburg, &c., are doubtless the most suited for all joiner's work requiring strength and durability for external joinery, in particular frames, jambs, windows, &c.; but here again prices for the best qualities are so high that inferior qualities of same are used and Swedish goods generally given to the joiner, much to his annoyance, so much time being often spent in making defects good and getting rid of sap that would more than repay for the extra £4 or £5 per standard asked for best qualities.

American white or bass wood is not a very satisfactory wood to the joiner unless specially selected, as there appear to be two distinct classes, one soft and easily worked, and the other cross-grained, tough and almost as difficult to work as some of the hard woods; but the selected well repays for labour bestowed. Very much of the furniture now sold as satin walnut is nothing more than stained bass wood.

Oregon, or "Horrible" Pine so named by the joiner, is a most objectionable wood to work, and is doubtless the most unsatisfactory to look at when finished, for no matter what are the pains taken, and care bestowed, the grains being so different in texture, "very hard and very soft," an even surface is never obtained, and the joiner is thankful it is a wood very deservedly ostracised by the builder.

Kauri pine should, to my thinking, be placed amongst the hard woods, and doubtless would be, except for the fact that, as regards its first cost, it is less than best qualities of Archangel or Petersburg; but considered from the labour point of view it is worth at least double either of these woods. It is utterly impossible to mortise without boring, or to scribe by hand pressure on the tools. It can certainly be got up to a very nice finish and will take either walnut or a mahogany stain, but it must not be given to the joiner with expectancy. Labour will come out at the same price as on yellow deal.

Pitch Pine is another of the woods a joiner does not desire. It is difficult to work; cloggy to the tools and to the glass papers, considerably more costly in labour than yellow deal; when thoroughly dry very hard and brittle; and splinters invariably result in gatherings and festers to manipulators.

There are very many woods too numerous to mention used by the joiner, but for the soft woods the writer would ask, Archangel or Petersburg yellow best quality, American yellow pine and selected American white or bass wood, and Christiania white deal: for hard woods, Spanish or Cuba mahogany, Persian or Virginia black walnut, Riga wainscot, and Kauri pine.

THE SCHLOSS, LIMBURG-ON-THE-LAHN. DRAWN BY WALTER MILLARD.

THE AGE OF IRON.

It is one of Ruskin's luminous generalisations—points of permanent light in the tempestuous expanse of his life's literary work—that Britain possesses in a high degree one art, and one only, that of working iron. It may indeed be put broadly that the use of iron is the one line of material workmanship in which the English-speaking race is creatively original. In architecture proper we have created nothing: we have improved on no successful style of the past, and produced no vitally good combination. With all our wealth we rather fall behind past ages in respect of ambition to build; but we have really done a new thing in our structures of glass and iron. If it be asked what is characteristically British in the way of architecture we can but point to our railway stations. The answer is not exactly calculated to cheer the native lover of architecture; but it is a datum to be recorded like another; and it brings out the force of Ruskin's proposition.

It is worth while, once in a way, to contemplate the work of our hands—the Babylon we have builded in Scotland.

The Forth Bridge

is not merely a prodigy of copious and patient labour, or a costly joint-stock undertaking, or a unique complex of mechanical calculation—it is a great visible and permanent mark on the face of Nature, always with our favourite material, in a land and an age in which great visible and permanent creations have been singularly few, considering the available resources.

This lack of enduring impressiveness in the ordinary run of our public works has hitherto been the great difference between our polity and that of the ancient Empire which is so often compared with ours. The Romans were stupendous builders. A few fragments convey to the appreciative sense as vivid an idea as could a reconstruction in the mind's eye of the face of the ancient world. The ruin of a bath in a town in an out-of-the-way province, as was Roman Britain, reveals an amount of deliberate labour greater absolutely (to say nothing of the relative opportunities) than goes to the construction of almost any sort of public building in these days. The secret lies finally, of course, in the profound difference between the political and economic conditions then and now—the difference between a world of Imperial military administration and slave labour on the one hand, and a government by the people and a life of competitive but non-military industrialism on the other. Freedom has revolutionised values, and the giving to each man an imprescriptible estate in his own labour has meant thus far a restriction of the general estate in great tangible works.

But the Forth Bridge is at least one work vast as any Roman aqueduct, and far transcending in its difficulty the simple skill which Roman energy propelled to its tremendous undertakings. It will stand to show for many a day—a worthy monument of the age of iron, alike in its visible entity and its social function of bringing together a nation's provinces.

Nevertheless, it has to be confessed that the extremities of the great bridge, with their gaunt stone supports, need all the dignity of the central towers to relieve their æsthetic poverty. Looking at them, one recurs to the question raised about the locomotive—If it had been invented by the Italians of the Renaissance what would it have been like? If the Forth Bridge could have been built by Hadrian or Trajan, or in the Middle Ages, what would have been the aspect of those scraggy extremities? In the one case as in the other there is but one easy answer—they would have been much more beautiful.—Extract from an article in the "Dundee Advertiser."

MARISCHAL COLLEGE, ABERDEEN.

To-morrow His Majesty the King will open the fine block of granite building known as Marischal College, Aberdeen—an extension of the University. This is a most important work. The design throughout is noteworthy, while in point of size the building comes next to the Palace of the Escurial, near Madrid, which is the largest granite building in the world. Marischal College has a frontage of 400ft. facing Broad Street, and a general height of 60ft. It accommodates the administrative offices of the University, the science library, and lecture-rooms for law, education, and modern languages, and lecture-rooms, laboratories, and museums for agriculture, geology, medicine, physiology, and comparative psychology. It is built entirely of light-grey Aberdeen granite, which looks almost pure white when seen in sunshine. There is a long series of powerful-looking buttresses, very severe and restrained till they reach the top storey of the building, when they burst into a rich array of pinnacles and pierced and fretted battlements. Crowning the whole is a great tower.

The architect of the building is Mr. A. Marshall Mackenzie, A.R.S.A., F.R.I.B.A., the contractors being Messrs. D. Macandrew & Co., of Aberdeen. Mr. George Reid acted as clerk of works, and Mr. A. Dawson as the architect's surveyor.

The total cost of the building has been over £200,000, and, with the exception of £46,000 granted by the Government, the whole of this large sum has been raised by voluntary subscriptions.

Prof. Patrick Geddes, of Dundee, describes the building thus: "The tamely conventional modern Perpendicular college has been reorganised as far as might be by a master hand. Porch and staircase, vestibule and ante-chamber lead through long perspectives as of a cathedral into the noble aula walled with rose-coloured granite blocks and pointed with gold, and upon the former tower he has piled another hundred feet of four-square precipice, from which there leaps and crystallises a spiry fretted crown of glittering pinnacles. Here is one of these rare points of the world where we may see the beginnings of a fresh phase of architecture, for here, and perhaps for the first time, a neo-megalithic builder has struck a new note of emotion, and risen from sternness or solemnity into hope or cheer."

The following is taken from an Aberdeen paper, giving a reporter's interview with a representative of the builders in regard to the arrangements for the opening dinner:—

> The seating of such a multitude of people? Oh! here you are. We have 4,500 Austrian bentwood chairs, by Thonet Brothers, the celebrated makers. These have been supplied by Davidson Brothers, cabinetmakers, Union Street, and were imported direct to Aberdeen via Hamburg. They made two or three shiploads, so much space did they require. "Splendid chairs these; you can't break them." And so saying Mr. Smith seized one of the chairs and threw it high in the air—they are quite light—and when it fell on the floor it immediately rebounded, as if it were of indiarubber, and suffered no damage whatever.

Our Plates

New Dining Hall, Wellington College.

This design was submitted to the college authorities last year as one of four competing designs. As the plan shows, it comprises a dining hall with master's dining room and common room, matron's department, kitchens and all servants' offices on the ground floor, the basement being planned to give matron's linen and store rooms, stewards' offices and store-rooms, a large servants' hall, wine and beer cellars, cold-storage rooms, lavatories, etc. On the first and second floors are masters' billiard-room and guests' bedrooms, matron's rooms and maid-servants' bedrooms, tea-rooms for boys, bath-rooms, lavatories, etc. The design has been purposely assimilated in materials and general treatment to the character of the older buildings of the college. The intended materials were red bricks and Portland stone, with green Westmoreland slates for the roof. The colonnade or covered way which extends across the front and joins on the west with the Combermere block, shown on the right-hand side of the view (built some years ago from the design of Sir A. Blomfield and Sons), was one of the stipulated features of the scheme. The designs were judged by a committee of the governing body, without a professional assessor, and the competition (which was limited to Messrs. Charles J. Blomfield, T. W. Cutler, Sidney R. J. Smith and Edward Warren) was decided in favour of the first-named gentleman, whose design, also that of Mr. Warren, was exhibited this year at the Royal Academy. Mr. Blomfield has already been responsible for various buildings for the college.

CHINESE CARPENTERS.

Naturally pre-eminent among the skilled craftsmen of China, the carpenter stills maintains the leadership. Though almost invariably wedded to the use of the tools of his ancestors and to their methods, judged by results he is more efficient in his line than most foreign-trained fitters and machinists are in theirs, though a constant diminution of the difference is in progress. In judging the performance of the native workmen, it is almost impossible to avoid the popular bias that addiction to their own methods and tools invariably bespeaks fatuous conservatism. Though this is in many cases true, it will often be found on careful observation that what has passed for a stubborn blindness to the virtue of innovation is in reality a keener perception of comparative merits than the judge himself was aware. This is particularly true of Chinese carpenters. While most of their commonest tools differ in some radical way from our own, it is never safe to assume the superiority of the Western product. Their small axe, for example, is a beautifully balanced tool, and they are remarkably adept in the use of it, being able to work as true a surface therewith as can be obtained with an adze in the hands of the white man. On heavy work it is customary for two to hew together on opposite sides, striking alternative blows. Both hands are used and the recover is over the shoulder, alternative right and left. There is a freedom of swing with an accuracy of delivery which is a delight to watch, and the rapidity of blows is almost bewildering.—Mr. Barrett Smith in the "Engineering Magazine."

FRONT.

[illegible]

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

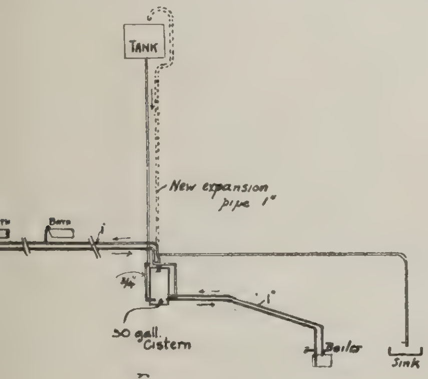
The querist's name and address must always be given, not necessarily for publication.

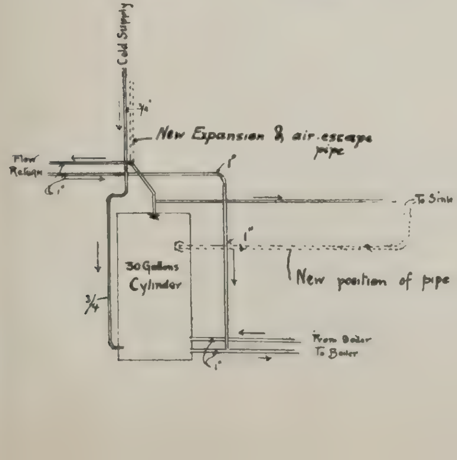
Defective Hot Water System.

PIETERMARITZBURG—NATAL writes:—"The accompanying diagram shows a heating apparatus which does not work properly. At times there is an abundant supply of hot water, which sometimes flows up the flow pipe and at other times flows up the return pipe. The boiler holds about two gallons, with the return pipe carried down in and to near the bottom of the boiler, the flow being taken off the top. Some days no hot water is obtainable, not even the cylinder becoming hot, although a large fire is used, and one might suppose, from the position of the pipes, that a short circulation should take place through the cylinder without passing through the whole system. In order to prevent the water filling up the return pipe, the cold supply has been reduced from 1″ to ¾″ before it enters the bottom of the cylinder. Another expedient has been resorted to in taking a branch off the return pipe just before it enters the boiler through the wall to the outside, and fixing a tap on same, so as to draw the cold water off as soon as the fire is lighted, and thus, if possible, induce the hot water to rise up the flow pipe, but neither when this is closed or open does the system work properly. The pipes are 1″, and the total length from boiler to highest point is about 70ft., with a 30 gallon cylinder. Can you suggest a remedy to put the system in working order?"

As the circulation is completely stopped at times, there must be a piece of wood, rag, cork, &c., that occasionally jams in one of the pipes, and is only dislodged by an accidental knock on the pipe, or by a sudden rush of water when a tap is opened quickly, or by some similar action, or the cooling of the hot metal. The remedy for this is to disconnect all the pipes, to see that all are clear, by drawing through them a wire with a small scraper and a mop at one end, examining and washing the cylinder, emptying it through the various nozzles, and coupling up again carefully. Or the cylinder may have become air-bound by the bubbles that escape from all heated water; the best remedy for this is to fit an expansion and air-escape pipe from the flow pipe, as shown by the dotted lines. This pipe must be led up to a greater height than the water-level in the main cistern and then turned down over it, so that nothing can settle in the pipe and all the water of expansion can run into the cistern. Or, if there be a branch on the side of the cylinder, say 6ins. from the top, the pipe to the sink tap had better be connected to it. Then, if one of the bath taps be opened for a minute or two three or four times a day, the air should escape from the top of the cylinder. If the end of the cylinder be at all dished down, or if the pipe and its coupling project down into the cylinder, there will be trouble with air, and a dome top with its nozzle completely outside is the best cure. If new pipes cannot be fitted at once, a temporary cure for the days when the apparatus will not work can be had by tying up the ball valve of the main cistern, and then opening the drain cock on the return pipe near the boiler and all the other pipes until the cylinder is empty. Rapping the cylinder should tell where the water-level is, and also help to dislodge the rag, &c., that plugs the pipe. Then the drain cock must be shut, and the ball valve untied, when water will again flow into the cistern, driving out the air through the open taps until water reaches them, when you will close them, and the cork will start on another voyage. There is no need to draw the fire for this; but if anyone is reckless or nervous, it had better be drawn. The reversal of current in the pipes is quite usual; whenever a tap is opened, water flows to it from all pipes that lead to it, and the flow due to heat is stopped for the time. When the tap is closed the water again flows, but in the direction it then finds easiest. The proportion of water in boiler to water in cylinder is small for English practice, but may suit in warmer Natal. Your proportion is 1 to 15, whilst here 1 to 10 is more usual. You will not gain much by putting in a larger boiler with the same proportion of heating surface to water contents. The heating surface, and especially that of the fire, must be in proportion to the total quantity of water in boiler, pipes, and cylinder. A small, round or conical, vertical boiler is the best; and if the cylinder can be put in one of the bathrooms there will be less strain on it, and the air-bubbles will escape better, while the flow to the taps will be as quick as when it is lower down, for it is the height of the main cistern that gives the driving pressure. There is no need to reconnect the pipe to sink (as shown by dotted lines) if the expansion and air pipe be fitted.

INGENIEUR.





Eating Away of Leadwork.

H. writes: "The lead cames on the inside of the windows of a billiard-room erected last year are covered with a white powdery substance, which partly dissolves with the condensed water on the inside of the panes, and is said to be oxide of lead. This is rapidly eating the lead away. The walls are panelled in oak to within 2ft. of the cornice, and the ceiling has exposed oak joists and beams. The plaster on the upper parts of the walls and on the ceiling is 'Granite Plaster,' as supplied by the Granite Silicon Plaster Co., of London. The lead glazing is fixed in iron casements set in stone mullions and transomes, and the oxidation is worse at the windows where there are opening casements, and shows only slightly at two small fixed lights in an ingle-nook. Enquirer has had experience of lead oxidising from the acid of oak where the two were in contact, but never had a case of this sort. Any information as to the probable cause will be gladly received."

It is quite possible that your lead casements are perishing from the action of rainwater and condensation water upon the lead. Soft water containing much oxygen often exercises considerable effect upon new lead. An oxide of lead is formed which is partly soluble in water. It is impossible, from the slight details given, to say whether this is causing the trouble in your case; but, if so, you will, I think, find that the white oxide will shortly cease to be produced. The manufacture of lead casements is in the hands of a very few firms, and is a highly technical business. I should, therefore, suggest that you call in the advice of a manufacturing firm having special experience in this class of work.

F. S. I.

Sketching near Blackpool.

BARNSLEY.—JUNIOR writes: "Can you give particulars of any sketching in the vicinity of Blackpool? I should like to make use of two or three days of a short holiday for this purpose."

There is very little architectural work in this district. Near the village of Upholland are the remains of a Benedictine priory, consisting of a high ivy-clad wall with five square windows in it. There are traces of arches built into a house close by. The church has nave, aisles and chancel, and a massive low tower; on the south side are some good windows, and inside are some brasses, a circular tower arch and oak benches, dated 1635, and some old glass. Orrel Hall, now a farmhouse, is of Elizabethan date.

H.Y.M.

Old Architecture Around High Wycombe.

HIGH WYCOMBE.—SCALE writes: "Which are the best examples of old work around High Wycombe, Bucks—say within a radius of about 20 miles—suitable for measuring and study?"

High Wycombe is not a good centre for the study of architecture. Although many interesting buildings fall within the 20 mile radius prescribed, those most suitable for useful study are on the extreme limit. Oxford is so situated, and furnishes well-known examples of every period, which it is needless to particularise. Other places which should be visited are Wing Church, with its Saxon apse and groined crypt, said to be 7th century work; Stewkley and Hemel Hempstead, fine Norman churches; Dunstable Priory, Norman nave and west portal, 13th century west front, 14th century tower; Leighton Buzzard, 13th century church with fine central tower and stone spire; Haddenham, 13th century church, near which the remains of Notley Abbey are incorporated in a farmhouse; Aylesbury, 13th century church spoiled externally by restoration; High Wycombe Church, with a 13th century south porch with good carved caps, &c.; Dorchester, Oxon, priory church very rich in 14th century work; Chesham, small cruciform 14th century church; St. Albans, abbey church containing work of all periods, abbey gatehouse, now grammar school; Tottern Church with good oak roof, *circa* 1500. Of domestic work there are Dinton Hall, *temp.* Henry VII.; Ockwells Manor, near Maidenhead, a fine 16th century timber house; Chequers Court, near the Kimbles (*circa* 1566); Hartwell House, near Aylesbury (Jacobean); Lucas Almhouses, at Wokingham, a charming brick building; Wotton House, near Aylesbury, late 17th century. There are other fine houses, but as tourists do not frequent Bucks and the local gentry have not abandoned their seats to farmers, as in so many other counties, access to most of the historic houses is difficult. E. G.

Roman Remains near Colchester.

WISBECH.—E. S. writes: "I know a field on Mersea Island, near Colchester, where there are known to be some Roman remains buried. About 60 years ago excavations were made and some arches and walling were found. The arches were not disturbed, but some of the walling was pulled down and the materials used in a garden wall now standing. There are several Roman remains on the island, and this particular field is generally supposed to have been the site of some important place. (1) Are Roman remains worth anything and would they pay for digging up? (2) If dug up, would the lord of the manor or anyone like that claim them? (3) If you are not in a position to supply the information asked for, to whom could I apply? Would the curator of the Colchester Museum do?"

(1.) Roman antiquities in England usually consist of the more solid parts of buildings which were almost totally destroyed by the uncivilised hordes which swept over Britain when the Roman dominion came to an end. The most valuable remains consist, as a rule, of tessellated pavements, and are of great interest when *in situ*; but I have never heard of a case in which a money profit has accrued when they have been unearthed. (2.) It is hardly likely that the lord of the manor will have a legal right to anything you may dig up, but I have known a case in which the Crown claimed important remains as "treasure-trove." (3.) The curator of your local museum would, no doubt, give you some hints, but the county archæological or antiquarian society would probably take a greater interest in the matter. F. S. I.

R.I.B.A. Intermediate Examination.

SOUTH SHIELDS.—C. writes: "Where can I get tuition for the above examination about South Shields, Newcastle, or Sunderland? I want names of private tutors or any colleges teaching same."

Armstrong College, Newcastle-on-Tyne.

Connection to Sewer.

TEAK writes:—"In a district where the building authority is a rural district council it is proposed to build two cottages. As the sewer at present ends a considerable distance from the site, which is by the roadside, I should be glad to know the greatest distance a builder can be compelled to lay a drain in order to make a connection to a public sewer. There is ample space available for cesspools in the rear. Also, would the council be bound to extend the sewer to within a reasonable distance of the site? From where would the measurements for the above distances be taken as regards the cottages?"

By the Public Health Act, 1875, section 16, the local authority are empowered to make a sewer, such as you suggest, if they think well. Section 21 of the same Act gives the property owner (under certain conditions) the right to connect his drains to the sewer. Section 23 further empowers the local authority to enforce such a connection, provided that the "sewer is not more than one hundred feet from such house." This section also gives the local authority power to construct a new sewer, should they consider it necessary, and to apportion its cost among the owners who benefit. F. S. I.

Prospects for Carpenter in New Zealand.

BLACKBURN.—J. V. J. writes: "What prospects are there for a carpenter and joiner in New Zealand?"

Employment is brisk with almost all the building trades in New Zealand. We advise our correspondent to consult the Emigrants' Information Office, 31, Broadway, Westminster.

Book on Farm Buildings.

SLEAFORD writes: "Is there a book on farm buildings, from an architect's point of view, showing the construction of detail? I already have the book on farm buildings by A. D. Clarke, but this is not what I want."

The only other works are: Professor J. Scott's "Farm Buildings," J. B. Denton's "Farm Homesteads," and H. Stephens's "Farm Buildings."

Foreign Architectural Publications.

LONDON, W.—BOOKS writes: "What is the cost of single copies of the "Berliner Architekturwelt," and where can it be obtained in London? Is there a somewhat similar publication in Austria? If so, can I get it in London? Is there a somewhat similar publication in France? Please also give names, cost, publishers, &c., of any books of photographs, drawings, &c., of Renaissance and modern Parisian buildings and details."

The "Berliner Architekturwelt" is published monthly by Ernst Wasmuth, Markgrafenstrasse 35, Berlin, W. 8, price 24 marks per year (about 2s. a copy). There is no similar publication that we know of in Austria, though there is the "Architektonische Runschau." In France there is "La Construction Moderne," published at 13, Rue Bonaparte, Paris, weekly, price 75 centimes (yearly subscription abroad 35 francs). We do not know whether you can obtain copies of these papers anywhere in London, though some can be seen at the Patent Office, Chancery Lane, as also the following:—"Schweizerische Bauzeitung," 5, Dianastrasse, Zurich II., weekly (foreign subscription 25 francs a year); "Deutsche Bauzeitung," Königgrätzerstrasse 104, Berlin, S.W., II., twice weekly (foreign subscription 24 marks a year); "Atlas zur Zeitschrift für Bauwesen," Wilhelmstrasse 90, Berlin (this is splendidly produced: it can be had in London from Williams and Norgate, 14, Henrietta Street); and "Allgemeine Bauzeitung," Andreasgrasse 1, Vienna VII., 1, quarterly (foreign subscription 20 marks a year). With reference to the desired book of photographs, drawings, &c., of modern Parisian buildings, very possibly there has been such a publication, but we cannot give you any precise title or particulars.

The Labour Market

Board of Trade Returns for August.

Owing to our last week's issue having had to go to press before the publication of the Board of Trade labour returns, we were unable to include the usual notes under this heading in our "Contractors' Supplement." The Board of Trade reports for August are as follows:—

Employment in the building trades continued dull during August, but was on the whole better than a month ago and a year ago.

In London

employment was better than a month ago, but not so good as a year ago. Returns received from 37 London employers show that in the last week of August 7,841 workpeople were paid wages, as compared with 7,035 a month ago, and 8,607 in August, 1905.

From Trade Union returns relating to carpenters and joiners it appears that the percentage of unemployed in London at the end of August was 5·5, as compared with 7·8 a month ago, and 5·5 a year ago. With plumbers the percentage for August was 7·5, for July 14·3, and for a year ago 8·7—a considerable improvement being shown as compared with a month ago. With bricklayers a slight decline was shown, but with all other branches, particularly with builders' labourers, a marked improvement took place as compared with July.

The Provinces.

Returns from 68 Employers' Associations in towns outside London show that in these towns employment was slack generally, and showed little change compared with a month ago and a year ago. The Trade Unions report that employment with bricklayers and masons was dull, and showed a decline as compared with a month ago. With carpenters and joiners it was still slack, but better than a month ago and a year ago. The percentage unemployed of Trade Union carpenters and joiners in the whole of the United Kingdom was 5·1, as compared with 5·3 a month ago and 6·5 a year ago; with plumbers the percentage was 7·5, as compared with 8·9 a month ago and a year ago. With slaters, plasterers and builders' labourers there was a slight improvement as compared with a month ago; with painters little change was shown.

In the Northern Counties

employment on the whole was quiet, and about the same as a month ago and a year ago. With painters a slight falling-off was reported. In the Wear district employment with plasterers continued bad.

In Yorkshire

employment on the whole continued quiet. Some improvement was shown, however, at Sheffield, Rotherham, and Leeds.

In Lancashire and Cheshire

employment was reported as fair in most branches. With carpenters and joiners and painters it was slack.

As regards the Midlands and Eastern Counties,

in Derbyshire employment was quiet, and about the same as a month ago; in Nottingham and the Leicester district it improved, except with bricklayers. In Norfolk a decline was reported, and employment continued generally slack throughout the Eastern Counties.

As regards the Southern and South-Western Counties,

employment with stonemasons in the Plymouth district improved somewhat, but with painters a decline was shown. At Bristol it continued dull. There was a general improvement in the South Wales district.

In Scotland

there was an improvement with bricklayers at Greenock and Paisley, and with masons at Edinburgh and Dundee.

In Ireland

at Belfast, Dublin, and Cork employment was dull, and worse than a month and a year ago.

THE ROTHERHITHE TUNNEL.

A highly interesting visit was paid last Wednesday by the members of the Society of Engineers to the Rotherhithe Tunnel, now in progress of construction for the London County Council. The work consists of a carriage and footway tunnel with approaches, commencing in Lower Road, Rotherhithe, and terminating in Commercial Road, Stepney. The total length is 6,883ft., of which 2,020ft. is open approach, 1,122ft. cut and cover, and the remaining 3,741ft. tunnel, lined with cast iron and concrete. There are four vertical shafts, one on each bank of the river near the water's edge and one at each end of the iron-lined tunnel further inland. These shafts vary from 70ft. to 100ft. in depth, and are each 50ft. in diameter inside, the sides consisting of two steel skins, 5ft. apart, with the intervening space filled with concrete.

The tunnel proper

is circular in section, the outside diameter of the cast-iron lining being 30ft., with a thickness of metal of 2ins. under the river and 1¾ins. elsewhere. The lining is put together in rings each 2ft. 6ins. wide, and composed of 16 segments with a key-piece. The rings are held together by means of bolts through the internal flanges, which have a depth of 14ins. When the work is completed these flanges will be hidden by the concrete lining, which will have an internal diameter of 27ft. The faces of the iron at the joints are all machined for a width of 12ins. and the segments fit metal to metal. The remaining 2ins. at the internal edge of the flanges are recessed for caulking with lead and rust cement. The tunnel is being constructed by

the shield system

under compressed air. A small pilot tunnel, 12ft. 6ins. external diameter, was first driven across the river and it is being followed by the main tunnel. The strata met with are known as the Woolwich and Reading beds, and consist chiefly of clay with beds of sand and shells, overlaying a bed of marl or rock of a chalky nature. Below the last occur a compact bed of pebbles and a thick bed of sand.

The cut and cover portion of the work consists of a brick barrel 1ft. 10½ins. thick, surrounded with concrete. The internal diameter of the brickwork is 27ft., the same as the concrete lining in the iron tunnel.

On the open approach the section consists of concrete retaining walls with battering face, surmounted by a brick parapet. A concrete invert fills the space between the footings of the side walls, and upon this the roadway is to be placed. The tunnel faces on each side of the river are built of red Aberdeen granite surmounted with a massive granite parapet, the surface of the whole being polished. Both the cut and cover portion of the tunnel and the open approaches are made water-tight with asphalt.

Present Condition of Work.

At the present time the approaches and cut and cover portion on the south side of the river are nearly completed. All the shafts have been sunk and the tunnel has been driven rather more than halfway across the river. The contract was let to Messrs. Price and Reeves early in 1904, and the work is expected to be completed in 1909. The total cost will be about £1,000,000.

The engineer-in-chief is Mr. Maurice Fitzmaurice, C.M.G., M.I.C.E., chief engineer to the London County Council, the resident engineers being Mr. E. H. Tabor, M.I.C.E., assisted by Mr. A. G. Drury, A.M.I.C.E.

Obituary.

Mr. J. H. Davies, senior member of the firm of Messrs. John H. Davies & Sons, architects, Chester, died recently, aged 75.

Bankruptcies.

Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—adjudication.

DURING THE WEEK ending Sept. 21st twenty-three failures in the building and timber trades in England and Wales were gazetted.

F. MUNNS, builder, Leagrave. R.O., Sept. 11.

T. R. AXCELL, builder, Southend-on-Sea. R.O. Sept. 14.

R. J. WRIGHT & Co., builders, Hitchin. R.O., Sept. 11

A. COATES, painter and decorator, Shildon. R.O., Sept. 13.

F. W. PHILPOTT, builder, Canterbury. Liabilities, £365; assets, £229.

LONGCAKE & CLEMINSON, plumbers and glaziers, Leeds. Adj., Sept. 11.

E. CHAMBERS, joiner, Nottingham. Liabilities, £333; assets, £10. P.E., Oct. 5.

J. MITCHIE, builder, Ballater. Liabilities, £692; assets, £322· deficiency, £422.

J. PHILLIPS, builder and contractor, Cardiff. Gross liabilities, £355; £305 to rank; deficiency, £292.

G. P. GILLHESPY, builder, Boldon Colliery. P.E., Newcastle-on-Tyne C.C., Oct. 18, at 11. R.O., Sept. 12.

T. WHALLEY, painter, Darwen. First meeting, O.R.'s, Preston, Sept. 26, at 12. P.E.. Blackburn C.C., Oct. 3, at 9.45.

C. FREEMAN, painter, Barnsley. First meeting, O.R.'s, Barnsley, Sept. 26, at 10. P.E., Barnsley C.C., Sept. 26, at 10.30. R.O., Sept. 13.

A. COX, journeyman joiner, Burnley. First meeting, O.R.'s, Preston, Sept. 26, at 11.30. P.E., Church Institute, Burnley, Oct. 26, at 10.45.

G. E. BATES, builder and contractor, Sheffield. First meeting, O.R.'s, Sheffield, Sept. 26, at 12. P.E., Sheffield C.C., Oct. 4, at 2. R.O., Sept. 10.

E. D. MULLIS & Co., builders' merchants, Loughborough. Unsecured creditors, £2,595; creditor partly secured, £4,925; deficiency, £3,615.

J. L. DUNN, builder and contractor, Sunderland. First meeting, O.R.'s, Sunderland, Sept. 26, at 3. P.E., Sunderland C.C., Oct. 4, at 11.15. R.O., Sept. 10.

I. WATKIN, painter and paperhanger, Chester. First meeting, Crypt Chambers, Chester, Sept. 27, at 11.30. P.E., The Castle, Chester, Oct. 30, at 11. R.O., Sept. 13.

ALDRIDGE & SON, builders and contractors, Willesden Green. R.O., Sept. 1. First meeting, London Bankruptcy Court, Sept. 13, at 12.30. P.E., same, Oct. 17, at 11.30.

J. WHITEHEAD & Co., brick, lime and cement merchants, East Dulwich and Peckham. R.O., Aug. 30. First meeting, London Bankruptcy Court, Sept. 14, at 11. P.E., same Oct. 30, at 12.

A New Town Hall at Sutton Coldfield, Birmingham, has been erected from designs by Mr. Arthur R. Mayston, A.R.I.B.A., of London. The building was opened last week. It is Georgian in style, harmonising with the existing buildings in the town. The total cost has been about £12,000.

Notes and News

The New Block of Admiralty buildings facing the Horse Guards Parade will shortly be ready for occupation.

The "Mauretania," launched at Wallsend-on-Tyne last Thursday, was built in a slipway glazed on Mellowes' patent "Eclipse" system.

A New Market-Hall for Haverfordwest is to be built, at a cost of £5,000, from designs (selected in competition) by Mr. Preece James, architect, of Tenby.

Institute of British Decorators.—The first gold medal of this institute has been awarded to Sir William Richmond, more particularly for his work at St. Paul's Cathedral.

An Abridged Edition of the "Burlington Magazine" is to be issued, price 1s., a fortnight after the publication of each number. The first appearance of the 1s. "Burlington" will be on October 15th.

The Public Library at North Islington, the first of five to be built in the borough, was opened on Thursday last. It is on the "open access" system, and has cost £9,000. Mr. Henry T. Hare was the architect.

A New Ward Block has been added to the Borough Isolation Hospital, Coppett's Road, Muswell Hill. It consists of two large wards, with accommodation for 24 patients. Mr. E. J. Lovegrove, the borough surveyor, was responsible for the work, which has cost £13,000.

The New Weights and Measures Office of the City of London was opened on Wednesday last by the Lord Mayor. The building is in Whitecross Street, and has been erected at a cost of about £6,000, from designs by Mr. Sydney Perks, F.R.I.B.A., the City surveyor.

Changes of Address.—Mr. E. W. Mountford, F.R.I.B.A., is moving his office from 17, Buckingham Street, Strand, to Norwich House, Southampton Street, Bloomsbury—three doors from Museum Station, Central London Railway.—Mr. W. D. Caröe is moving his offices from 8a, Whitehall Place to 3, Great College Street, Westminster.

The Bradford City Architect's Department.—A meeting of architects in Bradford was held last week (Mr. T. C. Hope in the chair) to discuss the report on the City Architect's Department and the alleged saving effected by the department as compared with what the cost would have been if the work had been done by outside architects. Strong disapproval with the department was expressed. (See p. 140 of our issue for last week.)

The National Association of Master House Painters will hold its fourteenth annual convention in Leeds from October 9th to 12th. An interesting feature of the meeting will be the presence of a deputation from La Chambre Syndicate des Entrepreneurs de Peinture et Vitrerie, of Paris. The Association carries on an important educational work of its own, on which it has already spent more than £1,800. A national competition for apprentices exists, and between £70 and £80 are offered in prizes, whilst a School of Decorative Painting has been established at Manchester, with travelling and other scholarships, for the benefit of youths seeking instruction in the higher branches of the trade.

The L.C.C. Central School of Arts and Crafts, at 316, Regent Street, opened its eleventh session on Monday. The instruction is adapted to the needs of those engaged in the different departments of building work and the curriculum provides instruction in a wide range of artistic handicrafts. The inclusive fee for the whole curriculum is £1 1s. per session, and apprentices, learners and improvers are admitted free. The principal of the school is Prof. W. R. Lethaby. The architectural section is directed by Mr. Halsey Ricardo and Mr. Sidney B. Caulfield; structural mechanics by Mr. E. Sprague; building construction by Mr. F. Herbert Mansford; and architectural modelling and ornament by Mr. Richard Garbe and Mr. D. McGill.

Holyrood Restoration.—Under the direction of the Office of Works, the partition in Queen Mary's audience chamber, in Holyrood Palace, which used to disfigure the south end of the apartment, has been removed. It was erected during the occupation of Charles I. As a result of the change, visitors are now able to see the chamber practically as it was at the famous interview of John Knox with Queen Mary. The ceiling bears 16 panels, which are an interesting study in heraldry, and, until the partition was removed, the design could not be fully traced. In the south wall there has been opened up a deep recess, which is supposed to have been Queen Mary's private oratory. A rich ceiling has been disclosed in a wonderful state of preservation.

A Note on Thomas Hardy.—In a "Real Conversation" with Mr. William Archer, Mr. Thomas Hardy, the novelist, has said that when he was an architect's pupil, he used to be sent round to sketch village churches as a preliminary to their restoration—which mostly meant destruction. "I feel very remorseful now," he says, "but, after all, it wasn't my fault—I was only obeying orders." It is this remorse, perhaps, that has tempted Mr. Hardy to propose that a tower be added to Holy Trinity Church, Dorchester, and present the rector with a design for it. Mr. Hardy, at sixteen, was articled to an ecclesiastical architect in the very place he is seeking to beautify. His time up, he migrated to London, where he worked first under the late Sir Arthur Blomfield (with whom he had a good grounding in Gothic), following afterwards in the wake of Scott, Butterfield, Street, and the other Gothicists. Forty-three years ago he won the Tite prize, and also an Institute essay prize "On Coloured Brick and Terra-Cotta Architecture." After that he began to drift from architecture into literature.

THE ORDERS.

We very much regret that, owing to a defect in machining, a large number of copies of our issue for last week had blotches on the illustration of "The Orders" accompanying the "Practical Notes for Architectural Draughtsmen," by Mr. Alfred W. S. Cross and Mr. Alan E. Munby. In view of this, we have considered it advisable to reprint the block in the present issue, so that those readers who are following this important new series of articles, and whose copies of last week's issue are defective, may be able to carefully study this first plate.

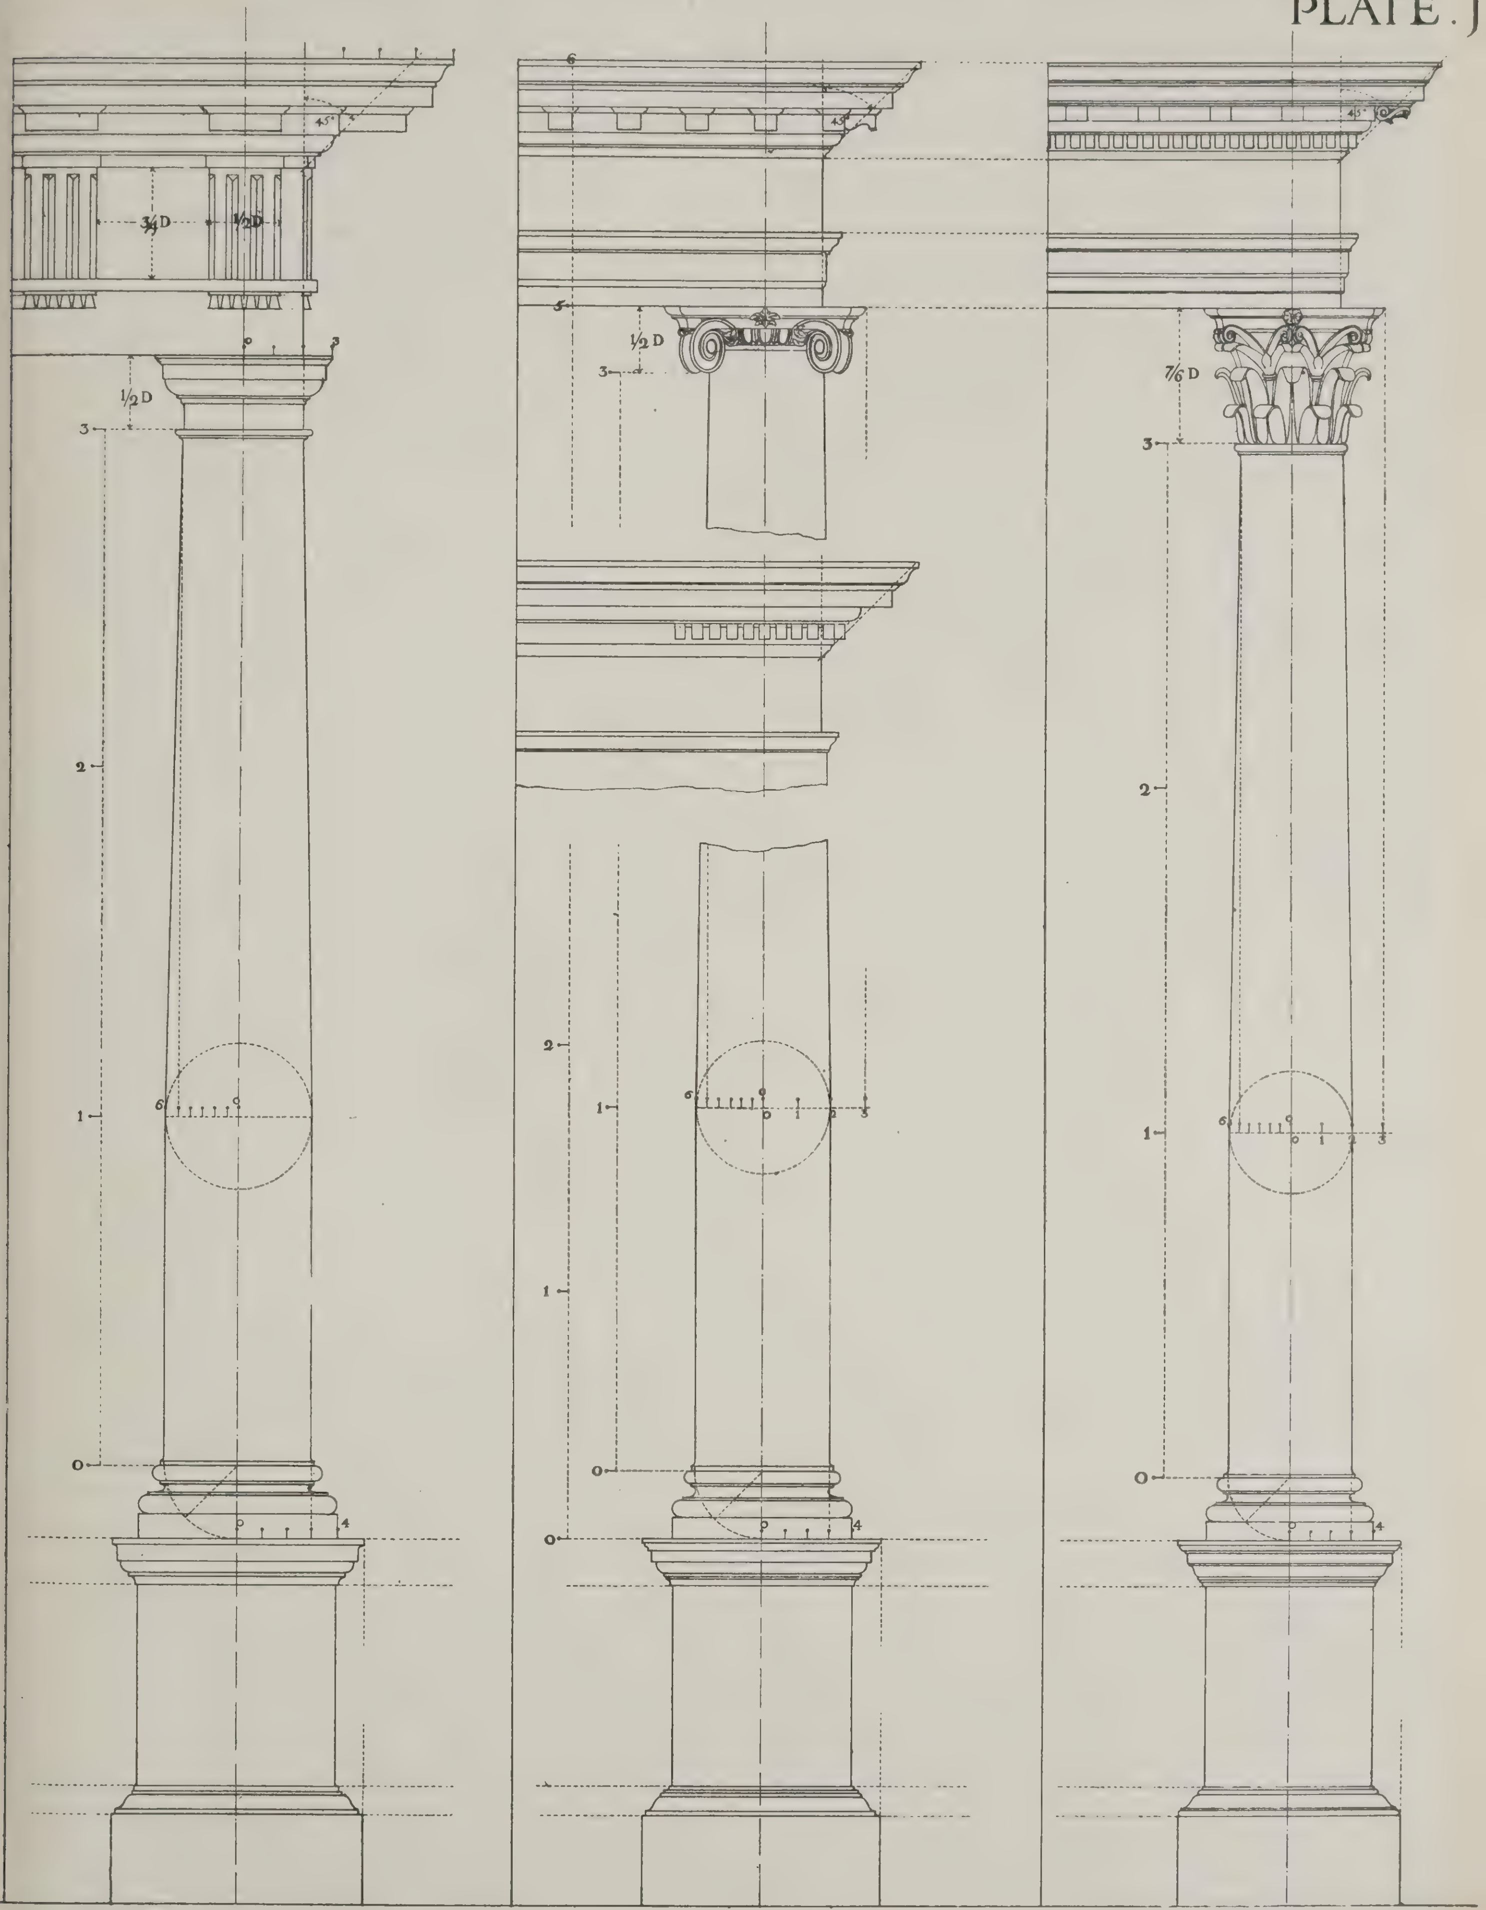
PLATE . J



DORIC IONIC CORINTHIAN

THE ORDERS AND THEIR APPLICATION. BY ALFRED W. S. CROSS, M.A., F.R.I.B.A., AND ALAN E. MUNBY, M.A.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Sept. 27. Castle Caereinion.—*Erection of a new cattle building*, at the Farm, Castle Caereinion. Plans and specifications may be seen at the Farm aforesaid. Tenders to be endorsed "Tender for Building," and sent in to T. Gittins, Pool Quay, not later than Sept. 27.

(£11,500), and a deposit of 29,000fr. (£1,160) is required to qualify any tender. Tenders by registered letter will be received at the "Société nationale des chemins de fer vicinaux" offices, 14 Rue de la Science, Brussels, not later than Oct. 9. A copy of the specifications may be obtained on payment of 1fr. from M. Mahieu, Rue du Moulin, No. 3, Waremme.

Oct. 13. London, S.W.—*Supply, delivery, and fixing complete* at the depot, Queen's Road, Wimbledon, of a circular saw bench, band sawing machine, and a 12-h.p. electrical motor for driving same. Particulars may be obtained on application to the Borough Engineer and Surveyor, Town Hall, Wimbledon. Sealed tenders, endorsed "Wood-cutting Machinery," to be delivery at the Town Hall on or before noon on Oct. 13.

Oct. 15. Coventry.—*Manufacture, supply and erection* for the Gas Committee, at their Foleshill Works, of the hydraulic plant:—Two wagon tipping machines, one direct acting hydraulic lift, two 1-ton capstans and snatch heads, one set of high-pressure steam pumps, one accummulator, &c., connecting pipes, valves, &c. Drawings, specification, and form of tender may be obtained on payment of £1 1s. Sealed tenders, addressed to the Chairman of the Gas Comittee, Gasworks, Coventry, endorsed "Tender for Hydraulic Plant," must be delivered not later than 9 a.m., Oct. 15.

Oct. 15. Coventry.—*Manufacture, supply, and erection, at the Foleshill Works* of the Gas Committee, of the following coal-conveying plant: Two gravity bucket conveyors, each about 830ft. long and capacity of 40 tons per hour; two short tray conveyors, each about 36ft. long and similar capacity; one large 4-roll coal breaker of capacity of 60 tons large coal per hour: high-pressure steam engines, for driving the breaker and conveyors; one 15-ton capacity receiving hopper, together with steel work, &c., for carrying breaker, &c. Drawings, specification and form of tender may be obtained of F. W. Stevenson, general manager, Gas Works, Coventry, on payment of £1 1s. Sealed tenders addreised to the Chairman, Gas Works, Coventry, endorsed "Tender for Coal Conveyors," &c., must be delivered not later than 9 a.m on Oct. 1.

Oct. 31. Zagazig.—*Installation of a supply of drinking water in the town of Zagazig,* in accordance with plans and specifications to be seen at the Ministry of the Interior. Tenders made out on stamped paper, obtainable from Lieut.-Col. Western, R.E., C.M.G., Queen Anne's Chambers, Westminster, S.W., and marked "Offre pour les travaux d'installation d'eau à Zagazig," should be addressed to "S. E. le Sous-Sécrétaire d'Etat, Ministère de l'Intérieure, Cairo," where they will be received up to Oct. 31. A deposit of 10 per cent. of the estimate is required to qualify any tender. Conditions of tender, together with lists of the materials and machinery required may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

Nov. 3. Shanghai.—*Construction and erection of two steel girder bridges across the Soochow Creek to replace the present Garden Bridge and Chekiang Road Bridge.* The Garden Bridge will consist of two spans, each of 171 feet and having a width of 60 feet between the parapets. The Chekiang Road Bridge will be one span of 196ft. with a width of 40ft. between parapets. General conditions, specifications, drawings, forms of tender, and all other information may be obtained at the office of Charles Mayne, M.Inst.C.E., municipal engineer, No. 15, Hankow Road. A charge of Tls. 100 will be made for the specification and set of drawings. Sealed tenders, separately for each bridge, and endorsed "Garden Bridge," or "Chekiang Road Bridge," will be received by W. E. Leveson, secretary, Council Room, Shanghai, not later than noon on Nov. 3.

Nov. 6. Madrid.—*Construction and working of a railway between Ferrol and Betanzos,* in accordance with conditions set forth in the "Gaceta de Madrid" of August 7. A Government subsidy of 3,054,508 pesetas (about £109,284), payable in eight annual instalments, will be granted to the concessionnaire. All materials imported for the construction of the line and for its working during the first 10 years will be exempted from import duties. A deposit of 145,259 pesetes (about £5,196) is required to qualify any tender. Tenders will be opened on Nov. 6 at the Directorate General of Public Works, Madrid.

IRON AND STEEL.

Oct. 8. Kingswinford.—*Supply and delivery on the works, as may be required, of about 715 tons of cast-iron pipes,* varying in size from 16ins. to 27ins. in diameter, for the Kingswinford R.D.C. Plans, detailed drawings, and form of contract may be seen, and specifications, schedules, and bills of quantities obtained at the offices of W. Fiddian, F.S.I., engineer, Old Bank Offices, Stourbridge, on payment of £2 2s. Two sureties will be required for the due performance of the contract. Sealed tenders, endorsed "Tender for Kingswinford Sewerage Contract No. 9," to be sent to G. F. James, clerk to the Council, the Council Offices, Wordsley, Stourbridge, not later than noon Oct. 8.

PAINTING & PLUMBING.

Sept. 27. London, S.W.—*Certain Painting Works at the Infirmary* for the Guardians of the Wandsworth Union. Form of specification and tender can be obtained upon application to F. W. Piper, Clerk Union Offices, St. John's Hill, S.W., and the same must be returned not later than 10 a m. on Sept. 27. Separate tenders must be sent in, endorsed "Tender for Painting Works, Infirmary."

Sept. 27. Northampton.—*Painting and decorating, &c.,* required at the Police Court, Guildhall, Northampton. Conditions of contract can be seen, and specifications and forms of tender obtained on application to A. Fidler, M.Inst.C.E., borough engineer, Guildhall. Sealed tenders, endorsed "Tender for Police Court Painting," are to be delivered to H. Hankinson, town clerk, Guildhall, on or before 12 o'clock noon, on Sept. 27.

Sept. 27. Llantrisant.—*Cleaning, scraping and painting various road, bridle and foot bridges* for the Llantrisant and Llantwit Fardre R.D.C., within the Council's area. Specification may be seen at the office of G. S. Morgan, surveyor, School Street, Pontyclun, from whom schedules of the bridges may be obtained upon payment of £1. Tenders must be delivered to the Clerk of the Council, W. Spickett, solicitor, Pontypridd, before 10 a.m. on Sept. 27.

Sept. 29. Dundee.—*Repainting the Town House buildings.* The specifications may be seen and schedules of quantities and forms of offer obtained at the office of J. Thomson, city architect, 91, Commercial Street, Dundee. Tenders, endorsed "Painting Town House," are to be lodged with W. H. Blyth Martin, town clerk, City Chambers, Dundee, not later than Sept. 29.

Oct. 1. London W.—*Outside painting and repairing works* at the Houseless Poor Wards, 86, East Street Marylebone Road, W., for the Guardians of the Poor. Persons desiring to tender may obtain a specification and form of tender upon application to the Guardians' architect, Mr. A. Saxon Snell, F.R.I.B.A., of 22, Southampton Buildings, Chancery Lane, W.C., and depositing with him a £5 Bank of England note. Tenders to be signed, sealed, and endorsed "Tender for Outside Painting Works, &c., Houseless Poor Wards," and addressed and delivered to H. T. Dudman, Guardians' Office, Northumberland Street, Marylebone Road, W., at or before 10 a.m. on Oct. 1.

Oct. 1. Margate.—*Painting of the external wood and ironwork, and the colouring of the rough-cast work* at the Wingham Pumping Station. Specification can be seen and particulars obtained at the Borough Surveyor's Offices, Municipal Buildings, Margate. Tenders, under cover, endorsed "Painting," to be sent to Edward Brooke, town clerk, Town Clerk's Office, 18. Cecil Square, Margate, not later than 1 o'clock on October 1.

Oct. 1. Stratford-on-Avon.—*Painting and Repairs at Corporation Properties.* Specification of the work may be seen, and form of tender obtained, upon application at the Borough Surveyor's office. Tenders, sealed and endorsed "Painting, etc.," to be sent to R. Dixon, borough surveyor, Municipal Offices, Stratford-upon-Avon, by October 1.

Oct. 3. London, N.—*External and internal cleaning and painting works,* at the Northern Convalescent Fever Hospital, Winchmore Hill, N., in accordance with specification prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief. Specification, conditions of contract, bill of quantities, and form of tender may be inspected at the office of the Board, Embankment, E.C., and bills of quantities and forms of tender can then be obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board not later than 10 a.m. on Oct. 3.

Oct. 1. Hull.—*Painting, &c., at the Relief Station, St. George's Road, Hull*, for the Sculcoates Union. Forms of tender and all particulars can be obtained or will be sent by post, on application to J. H. Wild, solicitor, clerk to the Guardians, Union Offices, Harley Street, Hull. Fair wages clause. Tenders must be sent to Mr. Wild so as to be received not later than 10 o'clock on Oct 1.

Oct. 5. Llanelly.—*Painting and papering required at the Union Workhouse* in accordance with specification, which may be inspected at the office of W. Griffiths, architect, Llanelly. Tenders to be sent in to D. C. Edwards, clerk, Union Offices, Llanelly, on or before Oct. 2.

Oct. 6. Chelmsford.—*Painting and other work* to the new Head Quarters, Springfields, Chelmsford, for the Standing Joint Committee of the Court of Quarter Sessions, &c. Specification can be seen at the office of F. Whitmore, county architect, 73, Duke Street, Chelmsford, any working day, except Saturday, between the hours of ten and four. Sealed Tenders, endorsed "Tender for Painting, etc., New Head Quarters, Springfield," must be addressed and delivered to F. Whitmore, not later than Oct. 6.

Oct. 8. Dublin.—*Painting of the following girder bridges*, for the directors of the Great Northern Railway Co. (Ireland):—1. The Carrickmacross Road Bridge at Dundalk Station. 2. Ardee Road Bridge over Barrack Street branch at Rail Yard, Dundalk. 3. Hill Street Bridge, Dundalk. 4. Underline Bridge on Howth tramway (G.N.R. [I.]), at Howth Station. Parties wishing to tender can see the specification at the office of W. H. Mills, engineer-in chief, Amiens Street Terminus, Dublin, or copy thereof at office of the district engineer, Belfast; and forms of tender can be obtained at either of the above-mentioned places on payment of 1s. each. Tenders, made out separately for each of the four contracts and on the forms supplied by the company, endorsed "Tender for Painting," should be lodged with T. Morrison, secretary, Secretary's Office, Amiens Street Terminus, Dublin, not later than 10 a.m. on Oct. 8.

ROADS AND CARTAGE.

Sept. 27. Royal Leamington Spa.—*Making a short length of roadway*, for the Town Council. Plans and specification may be seen at the office of their engineer, at the Town Hall. Tenders addressed to L. Rawlinson, town clerk, Town Hall, Royal Leamington Spa, and endorsed, "Tender for Road Making," are to be sent in before noon on Sept. 27.

Sept. 29. Walmer.—*Supply of 400 tons, more or less, of quartzite*, broken to pass a 1½-in. ring; also 50 tons fine, free from dust, delivered carriage paid, in trucks, at Walmer or Deal Station, in quantities as required, during the months from November to March inclusive for the U.D.C. Tenders, endorsed "Road Material," to be addressed to the Clerk to the Council, must be delivered at the Council Offices not later than Sept. 29. A sample of the material offered is to accompany each tender.

Sept. 29. Leeds.—*Making asphalt footpaths, covering the existing pitched foundation of the carriageway* with broken granite, and laying channels in Allerton-Drive, Chapeltown, for the Highways Committee. Forms of tender and bills of quantities may be obtained, and copies of the documents forming the contract inspected, on application at the Highways Office, 155, Kirkstall Road. Sealed tenders, endorsed "Tender for Private Street Works," and addressed to the Highways Committee, must be delivered at the Town Clerk's Office, Town Hall, Leeds, not later than 10 a.m. on Sept. 29.

Sept. 29. London, W.—*Supply of fine crushed Thames shingle, granite chippings*, or other material suitable for strewing upon carriageways during frosty weather, to be delivered at such times and in such quantities as may be required by the Council before the end of March, 1907. Printed forms of tender and further particulars may be obtained upon application to E. B. B. Newton, Assoc.M.Inst.C.E., F.S.I., borough surveyor, Town Hall, Paddington, W., between the hours of 10 a.m. and 4 p.m. (Saturdays, 10 a.m. and 1 p.m.) No tender will be considered unless upon the official form. Tenders must be sent in sealed and endorsed "Shingle," directed to A. W. J. Russell, town clerk, Town Hall, Paddington, W., and delivered not later than Sept. 29, after which no tender will be received. Samples of the material proposed to be supplied must be sent with the tender.

Oct. 1. Reigate.—*Supply of about 100 tons of rough Rhenish basalt or Cherbourg quartzite*, delivered carriage paid at the Workhouse, near Earlswood Station (L. B. & S. C. Ry.). Persons tendering must state how soon the material can be delivered, and send samples of same to the Master at the Workhouse, Redhill, Surrey. Tenders to be delivered to F. C. Morrison, 46, High Street, Reigate, Surrey, in sealed envelopes, endorsed outside "Tender for Stone," on or before Oct. 1.

Oct. 1. Frimley.—*Ballasting and metalling of 7¾ miles of roads*, for the U.D.C., in their district. Plans, sections and specifications may be seen, and copies of quantities and form of tender obtained from T. C. Jones, C.E., engineer and surveyor, Municipal Offices, Camberley, on payment of £2 2s. Sealed tenders, giving the names and addresses of two sureties, are to be delivered to F. T. S. Marsh, clerk to the Council, Municipal Offices, Camberley, endorsed "Tender for Reconstruction of Roads," not later than noon on Oct. 1.

Oct. 1. Teddington.—*Following works in connection with the making up of Munster Road*, in the Parish of Teddington, for the U.D.C.:—3,862 sup. yds. of roadway forming and metalling, 1,015 lin. yds. of kerbing, 1,015 lin. yds. of channelling, 2,312 sup. yds. of tarpaving. Plans and specifications may be seen, bills of quantities and forms of tender obtained on payment of £2 2s., on application to M. Hainsworth, surveyor, Elmfield House, Teddington. Tenders will not be considered unless made out on the forms provided. Sealed tenders, endorsed "Private Street Works," must reach G. H. Salmons, clerk, Elmfield House, Teddington, not later than noon on Oct. 1.

Oct. 1. Sandgate.—*Supply of the following highway materials* to be delivered at the cost of the contractor on or before Nov. 30:—60 tons of Guernsey granite, broken to pass a 1-in. gauge, to be delivered into carts at Folkestone Harbour or on rail at Sandgate station, free of all charge for freight, carriage, harbour, or other dues whatsoever; 10 tons of Guernsey granite siftings, broken to pass a ¾-in. gauge, ditto, ditto; 150 tons of Cherbourg quartzite, broken to pass a 2-in. gauge, ditto, ditto; 25 tons of Cherbourg quartzite siftings, broken to pass a ¾-in. gauge, ditto, ditto; 150 cubic yds. (more or less) of dug flints, broken to pass a 2½-in. gauge, and delivered upon roads or into depot as directed; 75 cubic yds. (more or less) of Kentish ragstone, broken to pass a 2½-in. gauge, ditto, ditto. All the stone is to be hand broken, thoroughly screened, free from dust and dirt, and to the entire satisfaction of the Council's surveyor. Tenders may be sent in for all or either of the above items, and samples of each of the items included in any tender must be sent to the Surveyor's office at Sandgate before the date of delivery of the tender. Forms of tender may be obtained upon application to J. S. Atkinson, clerk to the Council, Council Offices, 51, High Street, Sandgate. Tenders must be on the forms supplied, and under cover, marked "Tender for Highway Material," and must reach him not later than Oct. 1. In case any tender shall be accepted, the person or persons who shall have made such tender shall within one week after the acceptance of the tender by the Council execute such contract for the delivery of the material as the Council shall determine.

Oct. 2. Handsworth.—*Street improvement works in Wellington Road* for the U.D.C. All particulars may be obtained on application to H. Richardson, Assoc.M.Inst.C.E., surveyor to the Council. Sealed tenders, endorsed "Wellington Road Improvement," are to be delivered at the office of the Surveyor, Council House, Handsworth, Birmingham, on or before Oct. 2. Fair wages clause.

Oct. 2. London, W.—*Making up of the following roads*:—Wolverton Gardens (portion), King's Road (portion), St. Kilda Road (portion), Lyncroft Gardens, for the Town Council of the Borough of Ealing. The drawings and specification may be seen, and form of tender, together with schedule of quantities and other particulars, obtained from C. Jones, M.Inst. C.E., borough engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of 10s. 6d. for each road. Sealed tenders, in the envelopes provided, endorsed "Tender for Making-up——," must be delivered to G. E. Brydges, town clerk, Town Clerk's Office, Town Hall, Ealing, W., not later than 9.30 a.m. on Oct. 2.

Oct. 2. Leatherhead.—*Supply of about 1,000 tons of well-broken 1½-in. gauge and 120 tons of ½-in. chippings of Basalt, Quenast, or Enderby granite*, in truck loads at Leatherhead station for the U.D.C. Samples of stone to accompany tender. Tenders are also invited for steam rolling and scarifying. The contractor to supply 10 or 12-ton steam-roller, with driver, flagman, notice boards, stores, water-cart, and fuel. Contractors are to state the rate per day for rolling and the price per square yard for scarifying. Tenders to be submitted, under cover, addressed the Clerk, U.D.C., Council Offices, Leatherhead, on or before Oct. 2nd, at 5 p.m., endorsed "Tender for——."

Oct. 2. Lewisham. S.E.—*Kerbing, channelling, and metalling the roadway and paving the footpaths with artificial stone (in separate contracts) of Saravia Road, Lewisham.* The plans and specifications may be seen and forms of tender obtained at the Town Hall, Catford (Surveyor's Department). Copies of the specification may also be had on payment of the sum of 5s. in each case, which will not be returned. The tenders must be on forms issued by the Council, enclosed in an envelope, sealed and endorsed "Tender for Saravia Road," and must be delivered by 4 o'clock on Oct. 2, at the Town Hall, and placed in the box there provided for the purpose. The works must be proceeded with immediately on acceptance of tender and execution of contract, and the contractor must employ local labour as far as practicable in carrying out the work. Fair wages clause.

Oct. 3. London, S.W.—*New tar-paving and repairs to existing paving at Tooting-bec Asylum*, Tooting, S.W., in accordance with specification prepared by Mr. W. T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief. Specification, conditions of contract, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can then be obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board not later than 10 a.m. on Oct 3.

Oct. 3. London, S.E.—*Supplying and laying cresoted deal blocks* in the roadway in High Road, Lee, from High Street, Lewisham, to Lee Green; also for repaving with the same material a portion of the roadway in Tranquil Vale, Blackheath, particulars of which are set out in the specifications and forms of tender for the Borough of Lewisham. The plans, specifications, and conditions may be seen and forms of tender obtained at the Town Hall, Catford (Surveyor's Department). The tenders must be on forms issued by the Council, enclosed in an envelope, sealed and endorsed "Tender for Wood Paving in——," and must be delivered by 12 o'clock on Oct. 3, at the Town Hall, and placed in the box there provided for the purpose. The contractor must employ local labour as far as practicable in carrying out the work.

Oct. 4. Bromley.—*Works of sewering, levelling, paving, metalling, channelling and making good Hayes Road.* The works will include (about)—Excavation, 3,250 cubic yds.; hardcore, 1,620 cubic yds.: flints (pit), 1,330 cubic yds.; kerb, Norway granite, 1,620 lineal yds.; channel, New Guernsey setts, 260 lineal yds.; channel, secondhand setts, 1,070 lineal yds.; Burgess Hill brick paving, 2,970 super. yds.; 2-in. Hayes gravel margins, 1,460 super. yds. Draughtsman; total abstainer; thoroughly reliable; highest references.—Apply Box 2111, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

CONTRACTOR'S AGENT or ASSISTANT seeks POSITION in office or works. Eleven years' experience, roads, sewers and buildings; home or abroad.—S., 2 Douglas Road, Lewisham. 2106

ESTIMATING AND P.C. CLERK seeks change; 10 years' experience; successful; highest references; moderate salary.—Box 2100, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

FOREMAN MASON wants situation; just finished large job; used to all classes machines: first class references; age 31.—Box 2087, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C'

FOREMAN MASON desires RE-ENGAGEMENT; just finishing church job; abstainer; good knowledge of machinery; first class references and qualifications.—Box 2103, Builders' Journal Office, 6, Great New Street, London, E.C.

GENERAL FOREMAN wants situation, new or alterations; carpenter; age 36; abstainer; energetic; trustworthy; practical in all branches; twelve years' experience; good reference.—Box 2099, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

GENERAL FOREMAN (36) seeks RE-ENGAGEMENT. Well up in plans and measuring. With last employer 13 years on London jobs. Highest references. W., 77, Ardgowan Road, Catford. 2082

HANDYMAN desires Engagement on an Estate or Small Tenement Property. Use to all house repairs and collecting rents. Excellent references.—Box 2067, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

MACHINIST requires situation to take charge of small plant, gas engine, 3 cutter, overhand, thicknessing and saw bench; make own cutters, sharp saws, etc.; town or country.—A.B.B., 47, Colmer Road, South Streatham. 2088

PERSPECTIVES effectively executed; general architectural drawing; moderate terms.—Claude H. Simpson, 18 Hill Top Avenue, Roundhay, Leeds. 2062

PLASTERER wants job, foreman or working; town or country; abstainer and punctual; reference if required.—W. H. Kerr, 87, Cottage Grove, Clapham, S.W. 2073

QUANTITY SURVEYOR'S ASSISTANT (21) desires RE-ENGAGEMENT, temporary or permanent; 5 years' experience; abstracting and billing; good references.—C., 3, Ballock Road, Dowanhill Road, Catford, S.E.

QUANTITY SURVEYOR'S ASSISTANT open to re-engagement, temporary or permanent; recent employers 14 years; taking off and measuring up; thoroughly experienced; terms moderate.—Apply W. H. C., 18, Calabria Road, Highbury, London, N. 2072

WORKING FOREMAN PAINTER, competent and reliable man; 25 years' experience; town or country; moderate terms, good references.—R.W., 19 Alma Square, London, N.W. 2061

YARD FOREMAN & STOREKEEPER desires engagement in a Builders' or Contractor's Yard. Thorough command over men; distance no object. Good reference. Moderate salary.—Box 2068, Builder's Journal Office, 6, Great New Street, Fetter Lane, E.C.

Drawings, Tracings &c.

AN ARTIST and DRAUGHTSMAN is prepared to undertake Architectural Drawings or Designs for manufacturing firms, either in office or at home. Perspectives, Illuminated Addresses, &c.—E.S.B., Box 1813, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

DRAWINGS from rough Sketches, Designs, Details, Specifications, Drain Plans and Quantities Prepared; terms moderate. — J. W., 8, Rylett Crescent, Shepherd's Bush, W. 2101

PLANS, SPECIFICATIONS and QUANTITIES prepared from sketches and notes.
Richard M. Geater,
18, Prince of Wales Road, Norwich.

QUANTITIES AND SPECIFICATIONS ESTIMATES. (Nominal fee if unsuccessful). Experienced General Assistance, Competitions, Designs, Contract, Detail, and Working Drawings—Address, Quantity Surveyors, 21, Liverpool Street, E.C.

TRACINGS EXECUTED by first-class worker. — Box. No. 2110, Builders' Journal Office, 6, Great New Street, London, E.C.

Appointments Vacant.

AGENTS wanted throughout United Kingdom, with connection amongst builders and architects, to represent manufacturers of high-class enamels, varnishes, paints, &c., on commission.—Box 2019, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

TIMEKEEPER and PRIME COST CLERK wanted for Stone works; must be smart. Write, stating previous experience, wages required and references, to Box 2083, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

WANTED a PUPIL by an Architect and Surveyor. Exceptional opportunity for a smart youth. Premium. Address Box 2,076, Builders' Journal, 6, Gt. New Street, E.C.

WANTED, JUNIOR DRAUGHTSMAN well up in detailing constructional steelwork and capable of superintending small jobs. Must be quick at figures and neat tracer. Salary, 30s.—Write "J. D. 927," Messrs. Deacon's, Leadenhall, Street, E.C.

WANTED, BUILDER'S CLERK, near Birmingham; general routine. State age; experience; and salary required.—Apply, Box 2092, Builders' Journal Office, 6, Great New Street, Fetter Lane. E.C.

WANTED, Builder's CLERK OF WORKS to keep time, stores and generally assist. Send references and salary required to Ebbw Valley Building Company, Ltd., Ebbw Vale, Mon.

Miscellaneous.

ACCURATE Quantities prepared by London Surveyor of experience, in shortest possible time. Reasonable terms. Provincial work undertaken. Jobs measured up and settled in town or country.—Surveyor, 2 Minster Road, London, N.W. 2079

CONCRETE BLOCK MACHINES.—For sale, Machines for the manufacture of Building Blocks, Heads, Sills, Copings, &c. Full particulars and prices on application.—C. & A. Musker, Ltd., Engineers Liverpool. 2031

TO BUILDERS' MERCHANTS AND OTHERS.

FOR SALE, as a going concern, the GOODWILL, STOCK, HORSES, and VANS of the old-established Business of the late Mr. GUS DAVIES, Builders' Merchant, 146/158 Weedington Road, Kentish Town, N.W.—Full particulars obtainable from Messrs. Letts Bros., Solicitors, 8 Bartlett's Buildings, Holborn Circus.

FOR SALE. — BERRY'S latest CONCRETE MOULDING MACHINE with pumps, accumulators, and all appliances; pressure, 800 to 1,000 tons. This machine can mould blocks 6 ft. × 2 ft. × 12ins. deep, also flags or slabs any size required. It can also be used as a press for other purposes. The machine is new, and will be sold cheap. Can be seen working by appointment.—Address, Moulding Co. (W. Porteous & Co.), Glasgow.

POLING BOARDS, selected lengths and thicknesses (best quality and full measure).
Also Scaffold Boards, Putlogs, Scantlings, Deals, Battens and Boards. Lowest wharf prices.
C. H. GLOVER & CO., Ltd., Importers, Hatcham Saw Mills, Old Kent Road, S.E.

SECOND-HAND OPTICAL MART for the Purchase and Sale of LEVELS, THEODOLITES, DRAWING INSTRS. —Clarkson's, 338, High Holborn, London, W.C. (opposite Gray's Inn Road).

TO ARCHITECTS' ASSISTANTS.—Having been appointed representative of one of the largest and best Life Assurance Offices, I am willing to allow my fellow-assistants benefit of full commission, which in many cases equals half the premium. District immaterial.—Box 2093, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

TO ARCHITECTS & BUILDERS.—Fire-Resisting and Soundproof Partition Slabs FOR SALE; surplus stock. cheap; tested by the B.F.P. Co. —W. S. & Sons, 76, Eldon Street House, London, E.C. 2064

WANTED.—First-class Firm to undertake Sole Selling Rights of Speciality of Wall Linings. —Write Box 2065, Builders' Journal Office, 6, Great New Street, London, E.C.

WANTED TO PURCHASE No. 13 of The ARCHITECTURAL REVIEW.—Box W., Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

SEE PAGES XXVII AND XXVIII FOR EMPLOYMENT REGISTER.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.

September 26, 1906.

FIRE SUPPLEMENT (MONTHLY).

FIRE TESTS ON STONE.

A good deal of information has been published with regard to the fire-resisting qualities of certain building stones and the general effects which are known as the result of actual fires in buildings. Tests have been carried out from time to time, which have not perhaps been very thorough or systematic, but they have all brought out the distinguishing characteristics of the effect of fire. The latest tests which have been carried out recently by the geological department of the New York State Museum have been carefully made, and we give below a summary of the results obtained.

We may introduce this, however, by references to two previous American investigations into the subject. Cutting, in 1880, carried out some experiments for the "Weekly Underwriter" in order that insurance rates might be adjusted. His conclusion was that granite would not stand fire, and that granite walls were injured beyond the possibility of repair, and would have to be taken down after a fire. Sandstone he found to resist fire better than granite, while limestones and marbles were of superior value to sandstone. They seldom crack from heat and water, but when the heat is excessive they slightly crumble on the outside if water is thrown on them. When cooled without the application of water the injury is much less. If the temperature rises greater than 900 degrees Fah., and is long continued, they are changed into quicklime so as to flake off and crumble down. Conglomerates and slates show no capacity for resisting heat, as the slates crack, and conglomerates are almost immediately ruined.

Buckley.

Buckley performed a number of experiments in 1898 upon the building stones of Wisconsin which were published in "The Wisconsin Geological Natural History Survey Bulletin" of that year, which confirmed Cutting's investigations. Buckley, however, gives the reason why stones do not resist fire very well in the following words:—

"Other things being equal, it appears that a rock having a uniform texture and a simple mineralogical composition has the greatest capacity to withstand extreme heat. It is known that rocks are poor conductors of heat, and for this reason the outer shell of a rock may be very highly heated while the interior remains comparatively cold. If, after heating, the rock be quickly cooled, contraction of the outer shell takes place. The differential stresses occasioned thereby ruptures the rock and the outer shell is thrown off."

The Present Fire Tests.

As regards the latest tests on New York building stones, the details of the work were carried out by Mr. W. E. McCourt under the superintendence of Professor Heinrich Ries. Eighteen samples were selected for testing, these being types representative of those produced in New York State. A few examples are, however, not now used for structural purposes.

The samples from each locality were cut into three-inch cubes. Most investigators, who have studied the refractoriness of building stones, have selected one- or two-inch cubes; but these sizes do not give as accurate results as the larger ones, for the reason that a small piece becomes easily heated throughout the mass and consequently upon neither heating or cooling are differential stresses between the interior or exterior likely to be set up, as would be the case if larger cubes are selected. In actual fact in the burning of a building the stone does not become thoroughly heated; the heat penetrates probably but a slight distance into the mass, while the interior may remain comparatively cold. The heating and cooling of this outer shell causes strains which do not obtain in a stone which has been heated throughout its entire body. One-, two- and three-inch cubes of the same kind of stone have been tested in the laboratory, and while the smaller cubes stood fire very well, the larger ones were more affected and in some cases went to pieces. It was to avoid this error and to approach more closely the existing conflagration that the three-inch samples have been employed in the present series of tests.

Six Tests on Each Stone.

As far as the number of cubes would admit, six tests were made on the stone from each locality, four furnace and two flame tests. For the first set of experiments a Segar gas furnace was used, thus allowing the cube to be gradually and evenly heated. An opening was cut in the cover of the furnace large enough to admit the three-inch cube of stone, to which a wire had been attached to facilitate its handling.

One sample was heated at a time. The heat was applied gradually for half-an-hour until a temperature of 550° C. was reached, which was maintained for half-an-hour. The temperature was measured with a thermo-electric pyrometer. The cube was then taken out and allowed to cool in the air. A second sample was heated, as before, to 550°, and this was suddenly cooled by a strong stream of water. The third and fourth cubes were heated to 850° C., kept at that temperature for half-an-hour and cooled slowly and suddenly as in the 550° tests.

In order to approach more nearly the conflagration conditions samples were subjected to two flame tests. In the first case the cube was so placed as to be enveloped on three sides by a steady but not strong gas blast. The flame was allowed to play on the cube for 10 minutes, then the samples were allowed to cool for five minutes, after which time the flame was again applied for ten minutes, and the cube was again allowed to cool. To determine the combined action of heat and water a second cube was subjected, as before, to the flame for ten minutes, then a strong stream of water was turned on to the sample, along with the flame, for five minutes. Then the water was turned off and the flame continued for another five minutes, after which, for five minutes more the flame and water together were allowed to act on the sample.

Conclusions.

It is unnecessary for us to give the results of all these tests in detail. The generalisations which Mr. Court has drawn are, however, of interest and value. He thinks it is difficult to group the different kinds of stone in any order, for they vary among themselves, and also act differently under different conditions.

A stone which under some conditions stands up very well, will disintegrate under other conditions. Thus, for example, the granite from Northville acted very badly on fast cooling after having been heated to 850°, yet, under the combined action of the flame and water it was little damaged. Additional variations of this character all go to show that, for one temperature, the order of resistance will differ from the order given for another temperature.

At 550°C. (1,022°F.) most of the stones stood up very well. The temperature does not seem to have been high enough to cause much rupturing of the samples, either upon slow or fast cooling. The sandstones, limestones, marble and gneiss were slightly injured, while the granites seem to have suffered the least.

Temperature of Actual Fires.

The temperature of a severe conflagration would probably be higher than 550°C., but there would be buildings outside of the direct action of the fire which might not be subjected to this degree of heat, and in this zone the stones would suffer but little injury. The sandstones might crack somewhat; but, as the cracking seems to be almost entirely along the bed, the stability of the structure would not be endangered, provided the stone had been properly set.

The gneiss would fail badly, especially if it were coarse-grained and much banded. The coarse-grained granites might suffer to some extent. These, though cracked to a less extent than the sandstones, would suffer more damage and possibly disintegrate if the heat were long continued, because the irregular cracks, intensified by the crushing and shearing forces on the stone incident to its position in the structure, would tend to break it down. The limestones and marble would be little injured.

The temperature of 850°C. (1,562°F.) represents fairly the probable degree of heat reached in a conflagration, though undoubtedly it exceeds that in some cases. At this temperature we find that the stones behave somewhat differently than at the lower temperature. All the cubes tested were injured to some degree, but among themselves they vary widely in the extent of the damage.

All the igneous stones and the gneiss at 850°C. suffered injury in varying degrees and in various ways. The coarse-grained granites were damaged the most by cracking very irregularly around the individual mineral constituents. Naturally, such cracking of the stone in a building might cause the walls to crumble. The cracking is due, possibly, to the coarseness of texture and the differences in coefficiency of expansion of the various mineral constituents. Some minerals expand more than others and the strains occasioned thereby will tend to rupture the stone more than if the mineral composition is simpler. This rupturing will be greater, too, if the rock be coarser in texture. For example, a granite containing much plagioclase would be more apt to break into pieces than one with little plagioclase for the reason that this mineral expands in one direction and contracts in another, and this would set up stresses of greater proportion than would be occasioned in a stone containing little of this mineral. The fine grained samples showed a tendency to spall off at the corners. The gneiss was badly injured. In the gneisses the injury seems to be controlled by the same factors as in the granites, but there comes in here the added factor of banding. Those which are made up of many bands would be damaged more severely than those in which the banding is slight.

All the sandstones which were tested are fine grained and rather compact. All suffered some injury, though, in most cases, the cracking was along the lamination planes. In some cubes, however, transverse cracks were also developed.

The Controlling Factors.

The variety of samples was not great enough to warrant any conclusive evidence towards a determination of the controlling factors. It would seem, however, that the more compact and hard the stone is the better will it resist extreme heat. In a general way the greater the absorption the greater the effect of the heat. A very porous sandstone will be reduced to sand and a stone in which the cement is largely limonite or clay will suffer more than one held together by silica or lime carbonate.

The limestones, up to the point where calcination begins (600°-800°C.) were little injured, but above that point they failed badly, owing to the crumbling caused by the flaking of the quicklime. The purer the stone, the more will it crumble. The marble behaves similarly to the limestone; but, because of the coarseness of the texture, also cracks considerably. As has been mentioned before, both the limestones and marble on sudden cooling seem to flake off less than on slow cooling.

The Flame Tests.

The flame tests cannot be considered as indicative of the probable effect of a conflagration upon the general body of the stone in a building, but rather as an indication of the effect upon projecting cornices, lintels, pillars, carving, and all thin edges of stonework. All the stones were damaged to some extent. The limestones were, as a whole, comparatively little injured, while the marble was badly damaged. The tendency seems to be for the stone to split off in shells around the point where the greatest heat strikes the stone. The temperature of the flame probably did not exceed 700°C., so it is safe to say that in a conflagration all carved stone and thin edges would suffer. However, outside of the intense heat, the limestones would act best, while the other stones would be affected in the order: sandstone, granite, gneiss and marble.

After having been heated to 850°C., most of the stones, as observed by Buckley, emit a characteristic ring when struck with metal and when scratched emit a sound similar to that of a soft burned brick. In those stones in which iron is present in a ferrous condition the colour was changed to a brownish tinge owing to the change of the iron to a ferric state. If the temperature does not exceed 550°C., all the stones will stand up very well, but at the temperature which is probable in a conflagration, in a general way, the finer grained and more compact the stone and the simpler in mineralogic composition the better will it resist the effect of the extreme heat. The order, then, of the refractoriness of the New York stones which were tested might be placed as sandstone, fine grained granite, limestone, coarse grained granite, gneiss and marble.

SAFEGUARDING LIFE IN THEATRES.*

A Study from the Standpoint of an Engineer.

By JOHN R. FREEMAN.†

It is a fair and moderate statement that the present practice of the art of fire-prevention as applied to theatres and buildings of public congregation is from 10 to 20 years behind the fire-protection of large industrial works, and true that the fire-hazard to theatre property in general, as measured by a comparison of insurance rates, is ten times as great for the modern theatre as for the modern factory. All of this is unnecessary. It is a wrong against the public that should be righted. The safeguards needed are mostly simple. The main features of some of them are already worked out and well proved within the great factories which engineers build and manage. The additional safeguards required to be worked out or adjusted for this special case—the automatic smoke-vents, the safe proscenium curtain, the safe warming and ventilation, the proper arrangement of automatic sprinklers in stage and dressing-rooms and store-rooms—are within the field of the mechanical engineer and are mostly simple problems to solve when serious attention and skill are once directed to them.

The Lesson from Actual Fires.

I first became actively interested in this question by the burning of the Iroquois Theatre at Chicago a little less than two years ago.

The great lesson of the Iroquois fire was only a repetition of a lesson that has been given several times before and each time forgotten. The recurring formula is:—

(1) A stage crowded with scenery.

(2) The sudden spread of the flames over the scenery.

(3) The opening of a door in the rear of the stage, an inrush of air.

(4) Scant smoke-vents over the stage, an outburst of smoke under the proscenium arch.

(5) Death to those in the galleries.

In 1881, at the Ring Theatre disaster in Vienna, with about 1,800 in the audience, careless lighting ignited a "hanging border," a large door in the rear of stage was opened, letting in a blast of air that drove the smoke through the proscenium arch; the iron curtain could not be lowered; special exit doors were found locked; 450 were killed, mostly in the upper gallery.

In 1887, at Exeter, England, fire caught on a stage crowded with scenery. Within about five minutes from the outbreak of the fire 200 were killed, mostly in the upper gallery.

In 1876, at Conway's Theatre, Brooklyn, N.Y., the stage was crowded with scenery; a border caught fire; the blast of suffocating smoke was increased by the opening of large doors in the rear of stage; about 300 were killed, all in the upper gallery.

Note the suddenness, the suffocation, and the fact that the fatalities are nearly all in the galleries!

The Problem.

The amount of combustible material on the stage in a great spectacular piece is surprisingly large. It is plain that the fuel supply is sufficient to send out an enormous volume of suffocating gas. Indeed, I have computed that merely the quick burning of the 160lbs. of gauze that hung over the Iroquois stage would heat a volume of air equal to that contained in the space above the proscenium arch to 1,000 degs. Fahr. There is good testimony to the effect that only about two minutes elapsed after the first spark until all the upper scenery was in flames. Only from three to four minutes' time elapsed before the large space of the hanging-loft was so filled with fire that the flames and smoke rolled out beneath the proscenium arch into the top of the auditorium; then came suffocation and death.

The main problem is to give prompt and certain vent to this smoke and suffocating gas elsewhere than through the proscenium arch.

The Solution.

The ordinary construction with a high spacious chamber for the hanging-loft above the level of the proscenium arch makes it a simple matter structurally to keep this fire and smoke out of the auditorium, and no matter how great the mass of flaming scenery a smoke-vent of one-eight or one-tenth the area of the stage, if instantly opened, would probably have saved all of this terrible suffocation at Chicago, at Exeter, at Brooklyn, and at Vienna.

Fig. 1 shows a longitudinal-section of the Iroquois through auditorium and stage. The form is typical and about the same in all the first-class theatres. To one who has not been behind the scenes and up to the gridiron the surprising thing is the great head room, commonly 70ft. from stage to gridiron and 80ft. or sometimes 90ft. from floor to roof, and necessarily more than double the height of the proscenium arch, into which are hoisted the great sheets of canvas on which the scenes are painted.

The conditions are plainly similar to that of the fireplace in our living-room magnified 10 or 20 diameters. Note how admirably the high space over the stage screened by the arch is adapted to give the best of chimney draught and not give us a smoky fireplace. The roaring fire on our hearth sends 95 per cent. of its heat up the chimney and gives out no smoke into the room, if only the chimney be properly designed and the damper open. An ordinary rule is to make the throat of the chimney at least one-tenth the area of the fireplace opening, or it may be stated that the space through the damper should be one-eighth the area of the hearth, and when we simply provide an adequate chimney area and a damper that will surely open we shall have adopted a safeguard that would have saved four-fifths of those who perished at the Iroquois Theatre fire, regardless of defective curtain and defective exits and absence of fire-hose on the stage.

---

* Summary of presidential address before the American Society of Mechanical Engineers at its annual meeting in New York City, December 7th to 9th, 1905.

† President Manufacturer's, Rhode Island and Mechanics' Assurance Companies, 815 Banigan Buildings, Providence, R.I.

Existing Regulations and Practice.

In a way it has long been recognised that there should be a large ventilator over the stage, and one city has copied from another the building law that in the case of New York reads as follows :—

> There shall be provided over the stage metal skylights of a combined area of at least one-eighth the area of the stage, fitted with sliding sash and glazed with double thick sheet-glass . . . the whole of which skylight shall be so constructed as to open instantly on the cutting or burning of a hempen cord. . . . Immediately underneath the glass of said skylight there shall be wire netting . . . &c.

The evident purpose of the thin glass is to cover the opening with something that will break out under heat if the mechanism for sliding off the cover fails. The wire-netting is to catch any piece of broken glass from falling to the stage.

The building law of the London County Council reads much the same, save that its ratio is $\frac{1}{10}$, and perhaps that is where the rule began. Some the leading American cities make the proportion $\frac{1}{10}$.

The idea of a large ventilator expressed in these rules is all right, but the execution is commonly all wrong, and needs some good engineering to provide a design of damper with careful details that will be sure to work. Note the antiquated suggestion of the burning of a hempen cord when fusible links have been used on the fire-doors in our factories for twenty years! There is no good reason to expect that the hempen cord in this position in smoky atmosphere from which oxygen had been largely removed would burn off until a majority of those in the gallery had been suffocated.

The requirement of thin glass in the building law is well meant, but it would be too slow in breaking out. Remember how quickly unconsciousness of suffocation comes in an atmosphere of smoke. The wire-netting called for is a positive danger as often applied.

Doubtless there are many good smoke-vents here and there that have been designed and built with skill and conscience, for the problem is not so very difficult; but I have not yet seen one of these vitally important pieces of apparatus in which the design had been worked out with reasonable degree of perfection of detail. The proper specification should be "Something of ample area that will be sure to open wide instantly without human intervention, and that cannot be stopped by warping, settlement, obstruction, frost, snow, rust, dirt, or ordinary neglect.

I do not know who first fixed this ratio of $\frac{1}{10}$ for size of ventilator, the same figure that appears in the rule of the London County Council. Its author might have built wiser than he knew, or may have taken it from the well-proved ratio of the fireplace chimney. It works out as safe when computed mathematically on theoretic grounds from the uncertain data. The material is so favourably disposed for ignition that the rapidity of combustion is largely a question of the air-supply. I am led by computation and precedent and the need of some factor of safety to concur in the wisdom of the ratio of $\frac{1}{8}$ or $\frac{1}{10}$ as already specified by the building laws of the great majority of our American cities, and believe it wise to base it upon the gross area of the stage floor rather than upon proscenium opening or cubical contents of the stage.

The Austrian Experiments.

Following the great theatre fire in Vienna, a committee of the Austrian Society of Engineers (Technischer Verein von Ober Oesterreich) built a model of the Ring Theatre on one-tenth of its lineal scale (which thus contained only one-thousandth of the cubic contents of the original) and made many tests and experiments.

The experiments were divided into two groups—the first comprising those in which no ventilators were opened over the stage, while in each of the experiments of the second group two ventilators were opened, having a combined area which according to the scale of their drawing was very nearly one-tenth of the area of the stage. In the first series of tests made by igniting sheets of paper hung to represent the scenery, but containing proportionally far less combustible material than is often hung on a theatre stage, they found that the expansion of the air caused by the heat quickly forced the curtain outward from the proscenium arch, and within about twenty seconds from lighting the fire this heating of the air produced an excess of atmospheric pressure much greater than that of the ordinary pressure of city gas, thereby explaining why it was that the lights in the Ring Theatre became so quickly extinguished after the outburst of the fire.

In the second series of these Austrian experiments their models of the ventilating shafts were closed by sheets of paper, and as soon as these burned open all excess of air pressure disappeared from the auditorium, and, indeed. the updraught drew the proscenium curtain inward over the stage. During these experiments an unexpected warning was given against covering smoke-vents by wire screens, for it was found the flying bits of charred paper carried up by the draught almost completely closed them.

The Committee of the Austrian Society of Engineers concluded that the outburst of flame and smoke into the upper part of the auditorium and the extinguishment of gas-lights in a theatre could all be prevented by providing adequate smoke-vents over the stage, and places these smoke-vents as the feature of first import in safe-guarding life in theatres, and says that without them emergency exits and fire-curtains will be of no avail; and in this conclusion I most heartily concur. Regarding the mechanical construction of these smoke-vents the committee says :—

"It is necessary that these be opened instantly upon the outbreak of the fire; mechanical contrivances of iron to be operated by human means will certainly fail, for according to all experiences in theatre fires thus far fright on the part of the employees prevents the use of such arrangements."

They warned against automatic contrivances whose action may be interfered with in consequence of rust or expansion by heat, and against sheet-iron valves falling inward by their own weight, which might be restrained from falling open by the excess of pressure due to updraught, and, finally, recommended that these shafts be closed by a quickly combustible tissue of hemp or jute covered with varnish or celluloid, and with a hole about $1\frac{1}{2}$ins. in diameter in the centre to invite quick ignition. Our Austrian friends were unfamiliar with the American fusible-solder link, which is certainly quicker and safer and more practical than any such tissue of varnished hemp.

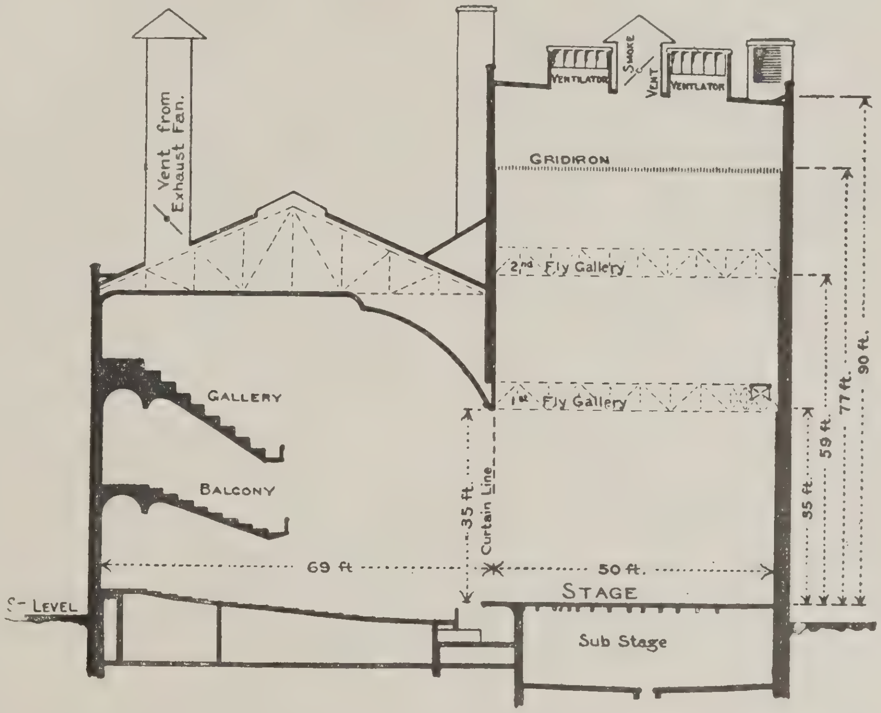

FIG. I. LONGITUDINAL SECTION THROUGH AUDITORIUM AND STAGE, IROQUOIS THEATRE, CHICAGO, ILL.

Fusible Links.

have been in common use on automatic fire shutters in our factories for nearly 20 years. Three types of these links are shown in Fig. 2. It is strange almost beyond belief how slowly and scantily these have found their way into the fire-protection of theatres.

These links melt open at about 162° Fahr., and thus will open long before flame reaches them. Their cost is trifling. Links like those shown in Fig. 2 tested to immediate rupture will break under a load of about 200 to 500lbs., but can be trusted to sustain continuously a load of only about 50 to 100lbs. All of the known solders that fuse at low temperature are subject to stretching or "cold flow" under long continued loads, unless these loads are made extremely small, and one of the most important features in the design of any such link is to make the direct stress upon the solder small and in tension over a large area rather than by shear. The links shown will open with about the same promptness as an automatic sprinkler. At the top of a rigging loft (gridiron) over a fire like that on the Iroquois stage they probably would open within 20 or 40 seconds after the blaze got a good start.

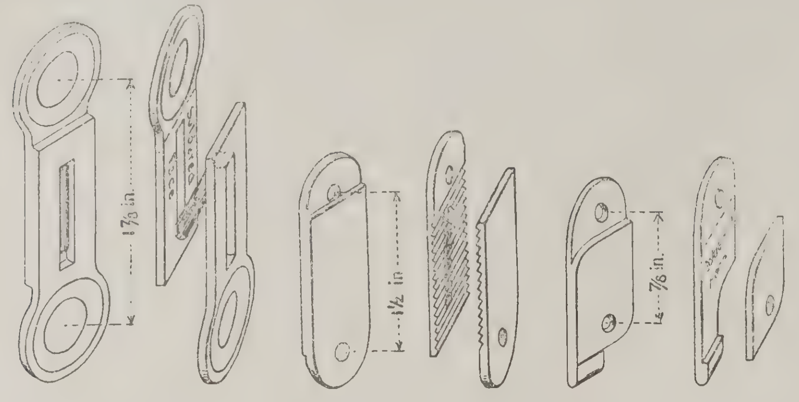

FIG. 2.—FORMS OF FUSIBLE LINKS FOR AUTOMATIC FIRE SHUTTERS.

The sensitiveness of the link or quickness of action under moderate degrees of heat depends on the thinness of the mass of metal to be warmed up and therefore on the rapidity with which it absorbs heat enough to melt the solder. These two characteristics—the weakness of the fusible solder under long-continued strain and the necessity for rapid absorption of heat—limit the strength of fusible link that can be employed. In many situations a link is desired of such form and size that when inserted in a rope it can run over the ordinary pulley.

Smoke-vent Design.

Concerning the design of smoke-vents, those I have seen in actual use have been, with hardly an exception, imperfect pieces of mechanical design. I have worked out two models shown in the accompanying drawings, Figs. 3 to 7. I am certain that with experience and constructing, one after another, these designs could be improved upon. It is best the total area of one-tenth the stage be subdivided into four independent units. The fundamental requirements are as follows:—

(1) Absolute certainty of opening by force of gravity in spite of neglect, rust, dirt, frost, snow or expansion by heat, twisting or warping of the framework.

(2) Quickness of opening to be secured by automatic links of the thinnest metal practicable, and also by controlling the doors by a cord run down to the prompter's stand and to the station of the stage fireguard.

(3) The operative mechanism of the smoke-vent should be simple and massive, designed not as a watchmaker would build it, but more according to the standards of railroad service or rolling mill practice. The counter-poise weights should be heavy and a constant tension on the release cord of upwards of 25lbs., so that rust, cobwebs or temperature changes might not be of noticeable effect in the resistance to be overcome.

(4) The vent should be of such form that it can be tested daily or at least at the weekly inspection by partially opening it, preferably closing it again by means of the cord running to the prompter's stand. It may perhaps add to the safety if it is of such design that it can be used whenever needed for the ordinary ventilation of the stage, summer or winter, rain or shine, thereby keeping it under constant view and bringing into immediate notice any difficulty about its opening or lack of repair.

In the first of these designs submitted, shown in Figs. 3 and 4, the 8ft. by 12ft. opening, of which four would be needed over the stage of ordinary size has a roof

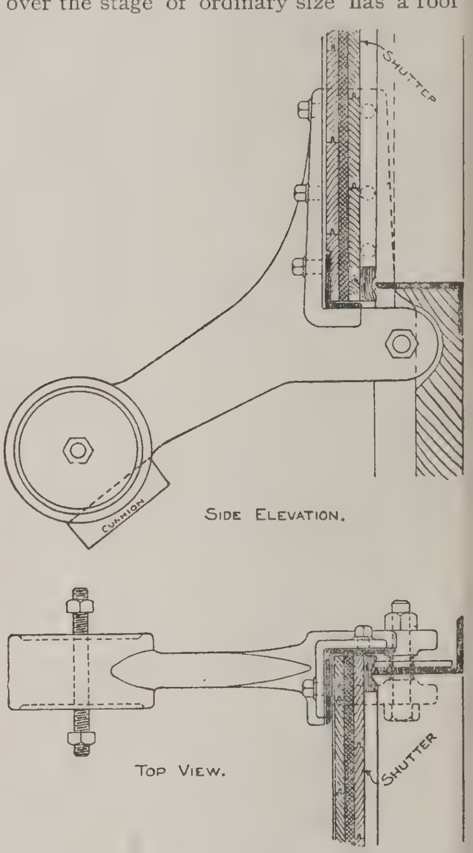

FIG. 4.—DETAIL OF COUNTER-WEIGHTS FOR HINGED SHUTTERS FOR SMOKE VENTS.

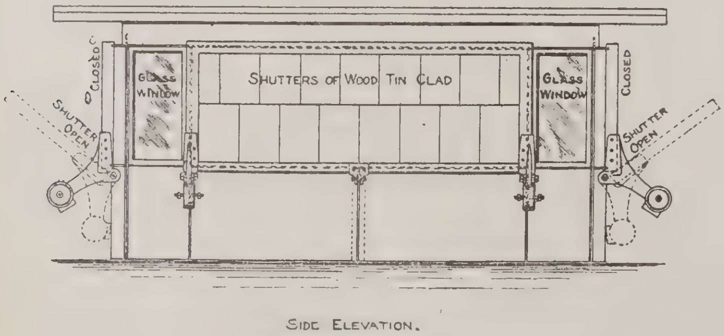

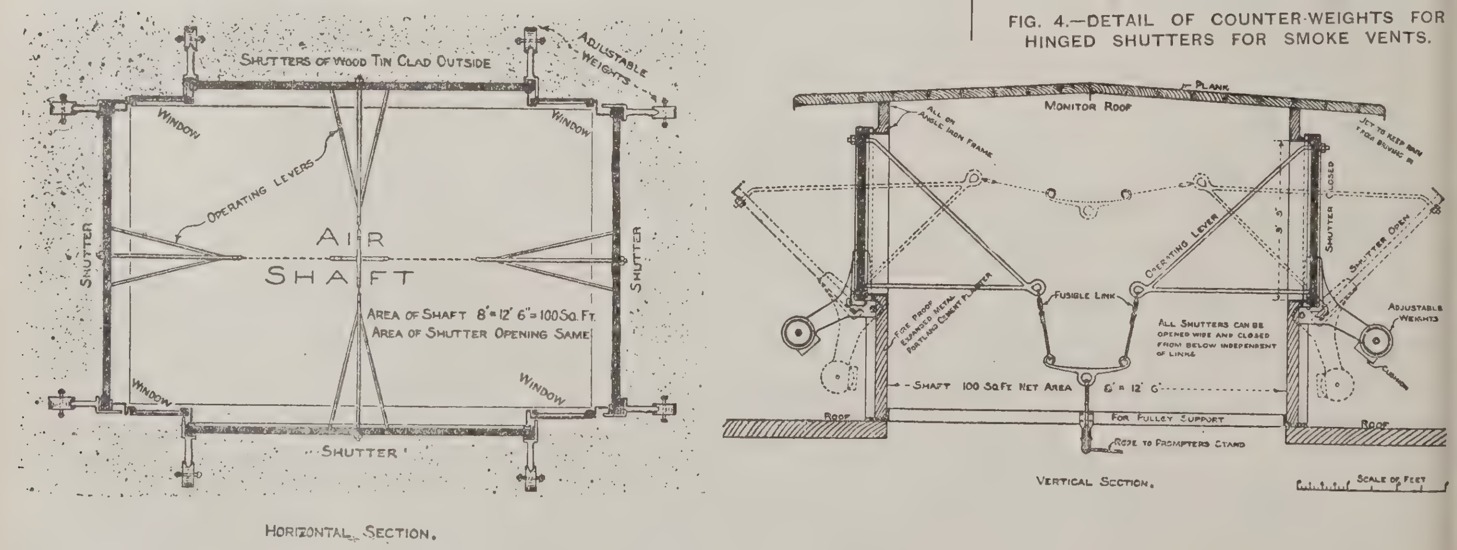

FIG. 3.—DESIGN FOR SMOKE VENT WITH HINGED SHUTTERS.

for protection from rain and vertical sides, that contain four small windows for admitting daylight to the rigging loft, but which can be closed by ordinary window shades for dark scenes. All necessity for the wire screen is avoided. The four shutters fall outward lest the pressure of the updraught tend to hold them shut, and are pulled open by force of gravity, opening to the full area called for. The pull on the rope holds them against their seat which, if made with a thin edge pressing loosely against fibrous material, as shown, will be more tight against cold-air draughts than a common window sash or house door. Fusible links are inserted in each of the four branches of the cord. No sprinkler should be placed up within the monitor containing these links, and care should be taken that the links are of a thin, quickly sensitive type.

In the second design (Figs. 5 and 6) the sliding type is used. This obviously cannot be used as an ordinary ventilator on rainy days. The special effort in remodelling this from the current New York type has been, first, to place the glass in the vertical side so that no necessity for a wire screen remains. Second, to provide a better track and trucks and arrange the joints so that the leakage of air through the clearance space would not tempt the janitor to close the space by something that may interfere with it sliding open.

A third sketch (Fig. 7) shows an arrangement of a safety ventilating shutter that sometimes can be conveniently placed in the brick wall near the top of the rigging loft.

Automatic Sprinklers.

The second safeguard in order of importance is in my opinion a complete equipment of automatic sprinklers over the stage and throughout all rooms and nooks and corners except in the auditorium.

It has been claimed that under the high rigging loft of a theatre sprinklers at a distance of 60ft. or perhaps 80ft. above the floor of the stage would be so remote from the flames that they would not open with sufficient promptness to be of material service. I am confident that this is untrue. The hot air from a fire quickly travels over a vertical distance of 60ft. or 80ft. Not more than five to ten seconds' time would be required for this, and the conditions for pocketing and confining the heat in a small area in the top of the rigging loft of a theatre are much more favourable than in many portions of factories where sprinklers are found to work successfully. One series should be placed below the gridiron, and, preferably, another series above it, these not being vertically over one another. Those in the top series are as likely to open first, but it is well to be liberal, and provide both series. A line should also run along the lower outer edge of each fly gallery. With care, a skilful sprinkler fitter can readily place and guard all the heads and pipes so that the danger of breakage need be no greater than in a factory. The 162-degree solder should be used.

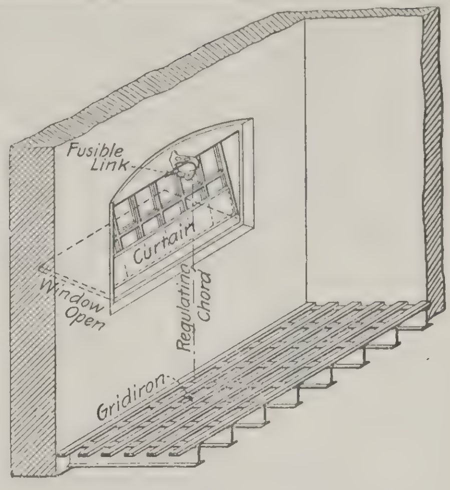

FIG 7. DESIGN FOR SMOKE VENT IN BRICK WALL AT TOP OF RIGGING LOFT (GRIDIRON).

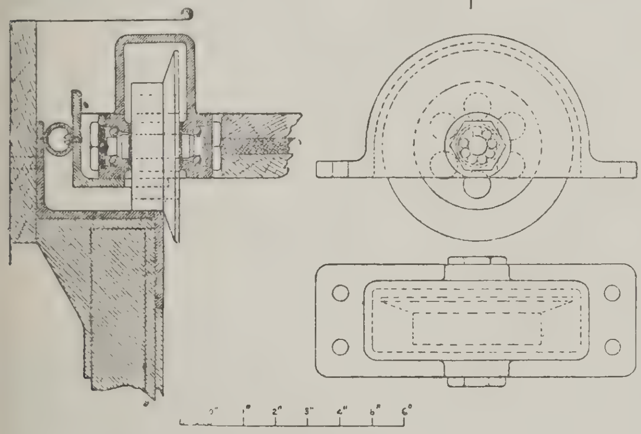

FIG. 6. DETAIL OF ROLLER AND ROLLER TRACK FOR SLIDING SHUTTERS FOR SMOKE-VENT.

Fire Curtains.

The third of the safeguards demanding investigation is the curtain for closing the proscenium arch. With good smoke vents and thorough automatic sprinkler protection over the stage and with ample stairways from galleries, it is probable that the audience could escape from a situation as bad as that in the Iroquois, even though there were a very poor fire curtain, or perhaps no curtain at all; but in theatres as in factories, it is wise to have a second, and even a third, line of defence, lest the first happen to be inoperative in the moment of need. The fire curtain for covering the opening under the proscenium arch in nearly all American theatres outside Chicago at the present time is made from a heavy canvas woven from an asbestos fibre; and in English theatres the asbestos curtain appears to have been steadily gaining in favour because of its less weight and smaller cost in comparison with a curtain of sheet iron, stiffened by ribs. In Chicago the failure of the Iroquois asbestos curtain and the excellent corrugated iron curtain of the auditorium—both in evidence—has made the steel curtain become the rule. These steel curtains merit little criticism except the absence of a positive down-haul and better holding and guiding in iron channels at the edge. Like nearly all steel ribbed shutters they will warp and twist off their seats under 10 to 15 minutes of exposure to a severe fire unless securely held at edges, and should smoke vents be closed and sprinklers lacking and a back door open, their loose fit would let volumes of suffocating smoke and tongues of flame pass into the auditorium. With the smoke vents open and the draft therefore inward, they will serve their purpose until the audience has escaped and the firemen have arrived.

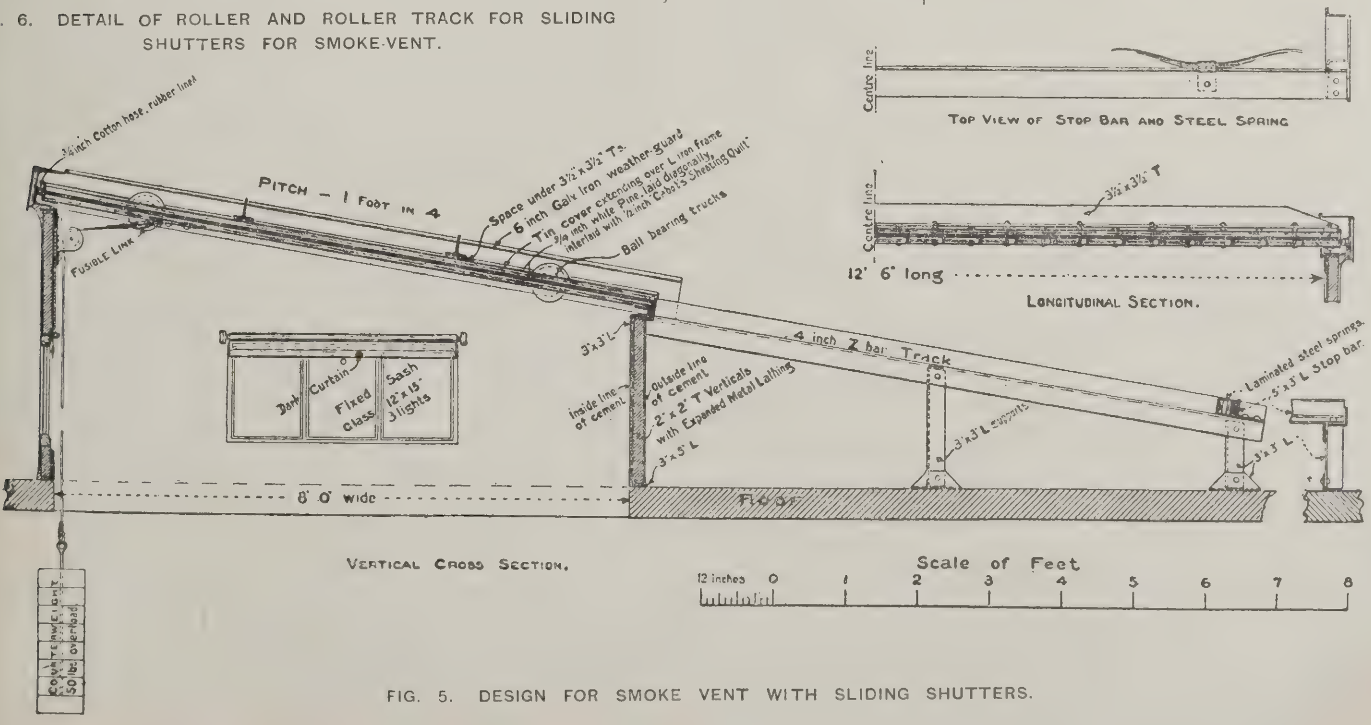

FIG. 5. DESIGN FOR SMOKE VENT WITH SLIDING SHUTTERS.

After having investigated the question of **fireproofing the scenery.** I am led to believe that we must, after all, rely on the safeguards of the engineer rather than those of the chemist. The efficient fireproofing of the great quantity of white pine used in frames, battens, and profiles (8,000 sq. ft. in the case of the Iroquois) appears to be a practical impossibility. The 11 miles of Manila ropes cannot be "flame-proofed" without too great sacrifice of their strength.

HOUSE AT HOMERTON, ENTIRELY GUTTED IN 1899, BUT THE VULCANITE ROOF AND CONTAINING WALLS REMAINING INTACT ARE STILL IN USE.

The great lesson out of all the theatre fires as to the danger to those in the gallery should not be forgotten in designing the **stairways and fire escapes.** The area, the total number of stairway exits, and the total width of stairway per 100 persons should be two or three times as great for the gallery as for the other parts of the house, and all exits should run in such a direct and obvious course that with a person once in them he could not fail to find his way to the bottom, although in total darkness. The flights of stairs should be each of the fewest steps practicable, with frequent landings on which one can steady himself, and with good, simple, continuous handrails that can be followed down each side, and a strong centre rail, continuous all the way, where wide stairs are necessary.

As to the aisles and exits a great deal of cutting out and enlarging of aisles and removal of seats was done immediately after the Iroquois fire, apparently without reflection that to deliver the crowd from the seats at the doorway with too great a rush increased the danger of crushing on the stairs. The narrowest aisle permitted in a theatre even close to the stage, is commonly 30ins. In a Pullman car and in the ordinary railway coach 22ins. and 20ins. is found ample for a crowd of people moving along with all necessary speed in single file.

It is far better to introduce additional aisles at the expense of making all the aisles narrower, thus lessening the tendency in a mad rush for people to try to crowd past one another, and giving better chance for those who are not strong to steady themselves by holding on with their hands to the seats on both sides the aisle as they go along towards the exit.

Another feature that is worthy of note is that it is not essential for safety that a theatre should stand in an open lot. Some of the worst theatre fires in history have happened where the theatre was open on three sides or four sides. It is far more important that attention be given to the details of fire walls and to providing passages.

In safeguarding our factories against fire we find **systematic inspections** and the filing of a weekly report one of the very best means towards safety. They would be of equal value for the theatre. A printed blank can readily be devised for each case. This should cover the completeness and operative condition of all valves, fire hose, sprinklers, fire pails, soda water extinguishers, hooks, fire doors, exit locks and latches, smoke-vents, fire curtain mechanism, and particularly of the neatness, cleanliness, and order of every room, passageway, closet, air chamber, loft, basement and fly gallery, used as a part of the theatre building. This inspection should be made on each Monday afternoon, since the week-end is the time when attractions are commonly changed and the confusion of new sets is most apparent.

FIRE-RESISTING ROOFS.

Vulcanite roofing in various forms has now been utilised in Great Britain and the Colonies for quite a number of years, and the present holders of the various patents are able to execute their work as based on quite 10 years' experience.

Vulcanite roofing, as is, of course, well known, comprises a bituminous, hornlike and elastic substance, which, whilst retaining its elasticity permanently, soon has an outer surface of metallic hardness which is absolutely impervious and offers hermetical resistance to water and air, whilst its hermetical nature is of the utmost importance as a water-proofing quality, and has in the first instance given it its reputation. It is this same hermetical resistance which plays such an important part in Vulcanite roofing as a fire resistant. As a result of the roofing being not only incombustible but air-tight, the draught which gets through ordinary tile roofing, slate roofing, and many other forms of metallic roofing at the joints is not created so as to fan any fire occurring below. Incombustible from above and air-tight from below, the roofing practically affords an ideal protection.

For this reason the fire insurance offices favour Vulcanite roofing. It is to be looked upon, also, as a safeguard even for concrete roofs, which are so often finished with cement or asphalt. It is well known, however, that cracks occur in concrete roofs, that expansion and contraction frequently affect them, and that both cement and asphalt fracture along these cracks, so failing to afford those water-tight and air-tight qualities which are so desirable and continually requiring repair.

VULCANITE ROOF OVER MODERN FACTORY USED AS ROOF TANK TO STORE 50 TONS OF WATER FOR FIRE EXTINGUISHING PURPOSES.

As always occurs with any method of construction when newly introduced, it had to meet a certain amount of opposition.

For instance, the point was raised, whether Vulcanite roofing was incombustible within the meaning of the London Building Act. The whole question was first brought before the Court, which upheld its incombustibility. The opponents were, however, not satisfied, and the matter was carried to the Appeal stage, when they were again beaten, the High Court finally considering the material incombustible within the meaning of the Act, and the opponents had to pay costs.

Fire Tests.

But apart from the commonsense view taken by the Court on the subject of fire resistance, Messrs. Vulcanite, Ltd., have been at pains to demonstrate the matter popularly, commencing as far back as 1899 with a public test at Wolverhampton, when two buildings covered with slate and Vulcanite roofing respectively were under test, resulting in the entire destruction of the slate roof, whilst Vulcanite roofing remained intact. Then there was the official test of the British Fire Prevention Committee, also in the form of a comparative test between a slate roof and a Vulcanite roof, and here again, whilst the slate roof was entirely consumed, the Vulcanite roof remained intact. We reproduce photographs showing this, as also a detail of the construction.

Actual Fires.

But even if the definition of the Court as to its fire resistance and public and official experiment had not proved the case, there were additional instances of actual fires, the most notable being one at Messrs. Boyes' works and Messrs. Roylance's works. In the former case the fire was an exceptionally severe one, yet although the whole of the woodwork near the roof was badly scorched and charred, the absence of air prevented the fire from getting a thorough hold of the roof, and no flame or smoke penetrated the roof surface at any point—in fact, the top surface was quite intact.

Whilst these two instances were from larger buildings—*i.e.*, works—there have been also instances in smaller property as, for instance, at Rushmore Crescent, Homerton, N.E., where, although in this cottage property there was a "burn out" which resulted in the insurers having to pay £300, and the interior of the cottage was entirely gutted, the roof remained and, as a matter of fact, served as a route of escape for the occupants. As this is rather an interesting case, we are illustrating the building six months after the fire under reconstruction, the original roof being in place.

At a period when so much is being done in the Metropolis with a view of increasing the safety of buildings from fire, it would be well for architects to consider the advantages of Vulcanite roofing where flat roofs are required. With the fire service they are, of course, infinitely more popular than lead or zinc flats, which are such sources of danger during fire brigade operations owing to the low temperatures at which these materials melt.

It is pleasant to observe that no less an authority than Mr. J. Belcher, A.R.A. (until recently President of the R.I.B.A.), covered the Royal London Friendly Society's new premises in Finsbury Square with Vulcanite roofing, which shows that it is holding its own in buildings of architectural pretensions, as well as in the more utilitarian factory and warehouse buildings.

It is not our purpose to enter into the different classes of buildings which Messrs. Vulcanite, Ltd., have covered in such large numbers, and which vary from public buildings to cottage property and from factories to high-class business premises; but in one case we would, however, illustrate an example which has considerable importance from the fire point of view—namely, a roof at Messrs. Leal's factory, where Vulcanite roofing has been taken up around the actual roofing surface, so that a tank can be formed with a reserve of water for fire extinguishing purposes, the water itself also, of course, being a non-conductor.

One of the great difficulties of factories is to have a sufficient supply of water for their sprinkler and hydrant systems, and there is a growing tendency to utilise roof surfaces as a large tank, whereby the whole

DETAIL OF SLATE ROOF. DETAIL OF VULCANITE FLAT ROOF.

THE FIRE-RESISTANCE OF VULCANITE FLAT ROOF v. SLATE ROOF: SECTION OF TESTING CHAMBER.

of the top of the floor is also now much cooler than would otherwise be the case.

We see in the application of this roofing a material addition to the fire resistance of the Metropolis, and an advance upon the slate or tile roof of old, which is certainly most unsuitable for many of the buildings of our larger cities.

Economically, perhaps we should add, this roofing also has certain advantages, and generally speaking, quite apart from any question of fire resistance, calls for serious consideration. We are pleased to observe that the Government departments and municipalities have taken it up as being both practical and economical, and that with the modern tendency to utilise the roof surface as so-called roof gardens or roof yards. there should be a growing field of application.

Last but not least, the many new works in connection with the covering of projecting shops should give Messrs. Vulcanite, Limited, a largely increased field of activity in the Metropolis.

CHIMNEYS AND FLUES.

A special committee of the National Fire Protection Association of the United States appointed to consider the question of chimneys and flues reports in general terms and not in the customary draft clauses for a building code. The committee thinks that all heat conveying flues should be free from all contact with inflammable materials, should have a free ventilating space surrounding them, should be securely built and supported, should be so placed that they can be readily reached so as to clean them off on the tops; the distance from inflammable materials is to a great extent dependent upon the construction of the flue, the temperature of the heat passing through it, and the continuous length of time the heat is passing through.

In all chimneys and flues of brick construction, only good, hard, well-burnt brick should be used; soft brick should be prohibited; all joints should be struck smooth on inside excepting where the flue is lined with well-burnt clay or terra-cotta pipe; no pargeting mortar shall be used on the inside; for bake ovens, low-pressure boilers and similar purposes the brickwork shall be at least 8ins. thick and lined continuously on the inside with well-burnt clay or terra-cotta pipe and be capped with terra-cotta, stone or cast iron; for high-pressure boilers the brickwork shall be not less than 12ins. thick with the inside 4ins. of this wall built up of fire-brick laid in fire mortar for a distance of 25ft. in any direction from the source of heat; for smelting furnaces or of steam boilers or other apparatus which heat the flues to a high temperature, shall be built with double walls of suitable thickness for the temperature, with an air space between the walls, the inside 4ins. to be of fire-brick laid in fire mortar for a distance of not less than 25ft. in any direction from the source of heat. All other chimney flues shall be lined continuously on the inside with well-burnt clay or terra-cotta pipe made smooth on inside from the bottom of the flue or throat of the fire-place if the flue starts from the latter; chimneys not in continual use, or in dwellings from fire-places or stoves, need not be lined, but must be struck smooth on inside. It is not advisable to have any bends or curves requiring a smaller upward inclination than 75 degrees, and all curves and bends are to be deprecated. No flue should be less than 8ins. by 8ins. All unused flue holes in chimneys shall be bricked up, or closed with permanent tightly fitting metal covers. Horizontal brick flues should be covered on their tops with neat cement.

As regards protecting woodwork and other inflammable materials from metal flues, in some places metal shields with air spaces of varying depths on each side will be sufficient; in others a heavy coating of asbestos on the flue and an air space will answer; in other places the woodwork should be protected with asbestos overlaid with tin following all lines and angles.

Tile flues should not be used; these are subject to breakage. Clay pipe flues or chimneys are prohibited.

EXTERNAL DRENCHERS.

We have had occasion to mention the value of external drenchers and have shown an illustration of roof drenchers to Messrs. Jaeger's works. We now give, by the courtesy of the "Sprinkler Bulletin," an illustration showing how certain drenchers actually got into operation at 95, Milton Street, E.C., thereby materially assisting the fire brigade in limiting the spread of fire in adjoining premises.

The fire in question occurred at No. 58, Chiswell Street, the back windows of which are separated from those of the Jaeger Co.'s premises by a distance of 18ft. The fire spread rapidly and the whole of the two top floors of the Chiswell Street property were burnt out, the flames leaping across the small 18ft. space and the heat actually cracking the window glass. The drenchers, however, immediately came into operation, and the flames could make no headway. This incident is particularly interesting at a time when efforts are being made to limit the hazard of vertical openings across courts and narrow thoroughfares. Glazing—and particularly fire resisting glazing—supplemented by drenchers should be of very great value.

The Dundee Fire.—The photographic general view at the top of page 23 of our last "Fire Supplement" was taken by Mr. J. Monkhouse Cartmell, A.M.I.M.E., Glasgow.

EXTERNAL DRENCHERS AT MESSRS. JAEGER'S WORKS, AS A MEANS OF PROTECTION AGAINST A FIRE IN ADJOINING PREMISES.

A New Feature. In this issue we give a very fully illustrated article on new buildings in Liverpool—the first of what we hope will be a very useful and interesting series dealing with the chief cities of the Kingdom. There is a considerable amount of good new work in the provinces which has never been illustrated by photographs, and we feel that in this series of articles we shall be covering quite a new field. While referring to new articles in our columns, we may say how pleased we have been to receive such gratifying letters in reference to our series on "The Orders," the second part of which appears in this issue.

Architect and Engineer. FALLACIOUS sayings, dictated either by a desire to make an epigram, or resulting from momentary excitement, sometimes gain considerable public credence. Such remarks do not deserve to be placed on record, but when made by a person of eminence they, unfortunately, too often achieve undeserved notoriety. They may be provocative of thought, but, more often than not, are applauded by the unthinking section of the public. Such remarks can hardly be ignored when constantly repeated. A remark which is reported of Prince Albert has been reiterated by an eminent engineer, evidently with his approval, in a popular book just published. The remark is that Prince Albert used to say that if he wished to *talk* about a thing he would send for an architect, but if he wanted to *do* a thing he would send for an engineer. Obviously, it could be retorted that it would be better if a great many engineers as well as architects talked less and did more. We can easily ignore Prince Albert, but the approval which his remark has received from a well-known engineer, and the fact that this opinion is certainly typical of many members of his profession, as well as the public, renders it desirable to enquire into the chief reasons for such a common opinion. First, perhaps, it reminds us of the disrepute into which the architectural profession brought itself some years ago. This aspect of the subject, however, has often been dealt with, and it is not necessary for us to belabour the dead horse. But another aspect, not only applicable to the architectural profession, but more or less to all the professions, will repay study. Representatives of the working classes have lauded the man who actually does things as being the only useful member of society. In this democratic age they are forgetful that even elementary tribes needed headmen and chieftains to control affairs, to direct labour, and meet their wants in the way of education. The labour advocate might as well look upon the machine as better than its attendant and constructor. The foreman and the labour "boss," crude examples of organisers of labour, are recognised as necessary even by the worker who, because he comes closer in contact with them and understands the part they perform, cannot deny the fundamental logic of their position. The engineer, too, is admitted by the profoundly ignorant because, being a man of science, he is looked upon as a master of the abstruse The architect, together with all those who work in form and facts that are common everyday things of life, is subject to interference, because the public, having that little knowledge which is dangerous, think they could, if it were their choice or opportunity, deal equally well with these realities, forgetful that considerable difficulties underlie the placid surface of common things which the constructive artist has to master. For instance, in planning, everyone thinks himself best competent to judge as to what would be desirable in the way of convenience and accommodation for living or business purposes. Then, again, in regard to decoration and form, the public believe themselves possessed of taste because they have crude likes and dislikes, the result of associations obtained in a narrow life or as a result of reading, travel abroad, and other visionary and fleeting impressions which are difficult to trace. It is strange, though, that the public should ignore as a matter of little or no importance a technical knowledge of construction, or else admit without demur the right of the engineer to this province, merely because he loudly proclaims it and condemns the architect unheard. It is obvious that this assumption of the engineer is entirely unwarrantable, because his profession came into being late in history, whereas the architect was already in possession of the field. By reason of the multitude of details necessary in building operations it is impossible for an architect to be a specialist in every branch. We are now accustomed to call professional specialists engineers, and the specialist seems inclined to sneer at the architect because he does not know so much about the narrow field of work as the specialist himself does; but this is surely expecting too much. As we have often said, it is the architect's controlling hand that brings the workers into their proper relation. We do not ask the admiral to be able to run the engine of a battleship as well as the engineer. We do, however, expect him to be able to understand, and to convey his directions intelligibly to the subordinates—in fact, to *talk* about a thing; and the architect occupies an exactly similar position. Every member of society is necessary in his own particular sphere and the attempt of any one section to laud themselves, and to belittle others, is wrong. The worker and the machine are just as necessary as the professional man, and it is not for us to judge their importance in the ultimate fitness of things, but the part each has to play is clear, and we must all recognise the part of the professional man to be to direct the worker. We all know the position of the architect. There are things he can do which the engineer cannot. Consequently, he should be allowed to exercise his profession without interference from those outside.

PRACTICAL NOTES FOR ARCHITECTURAL DRAUGHTSMEN.

By Alfred W. S. Cross, M.A., F.R.I.B.A. and Alan E. Munby, M.A.

THE ORDERS AND THEIR APPLICATION.

(Continued from p. 136, No. 606.)

Plate II.

The Tuscan Order, though seldom used, is suitable for situations in which an appearance of strength and simplicity is required, and in which the cost of the work is an important factor. It should always be devoid of any enrichment and the unbroken character of the frieze and cornice makes it particularly useful in designs presenting awkward problems of intercolumniation.

The ratio of the dimensions of its parts is exceedingly simple. It should be noticed that the fillet below the cincture of the shaft is included in the height of the base of this Order. The projection of the cornice over the upper circumference of the column is, in this and in all Orders, except the Doric, equal to its height.

The Doric Order is always effective when used in lower storeys, arcades, and door and window openings, but owing to the triglyphs upon the frieze, which must fall centrally over the columns, it is the most difficult to deal with when spacing is in question.

The dimensions of the cornice do not lend themselves to any simple ratio and its projection is always greater than that adopted for the other Orders. The 45° line from the top of the frieze at once gives the bed mould of the mutule course, and one-third of the height of the cornice added to the top projection of this guiding line gives the total projection, while the mutules are one-half a diameter in side elevation. Some considerable modifications of the Order, as here represented, will be found to exist in many recognised examples. Occasionally the mutules are dispensed with, and their bed mould is cut to form a dentil course, as in the Theatre of Marcellus. The cyma crowning the cornice is often replaced by a cavetto, while the Doric base (shown alternatively on the plate) sometimes replaces the more graceful attic base. When this base is used, the upper fillet should be included in the height of the shaft, as in the Tuscan Order.

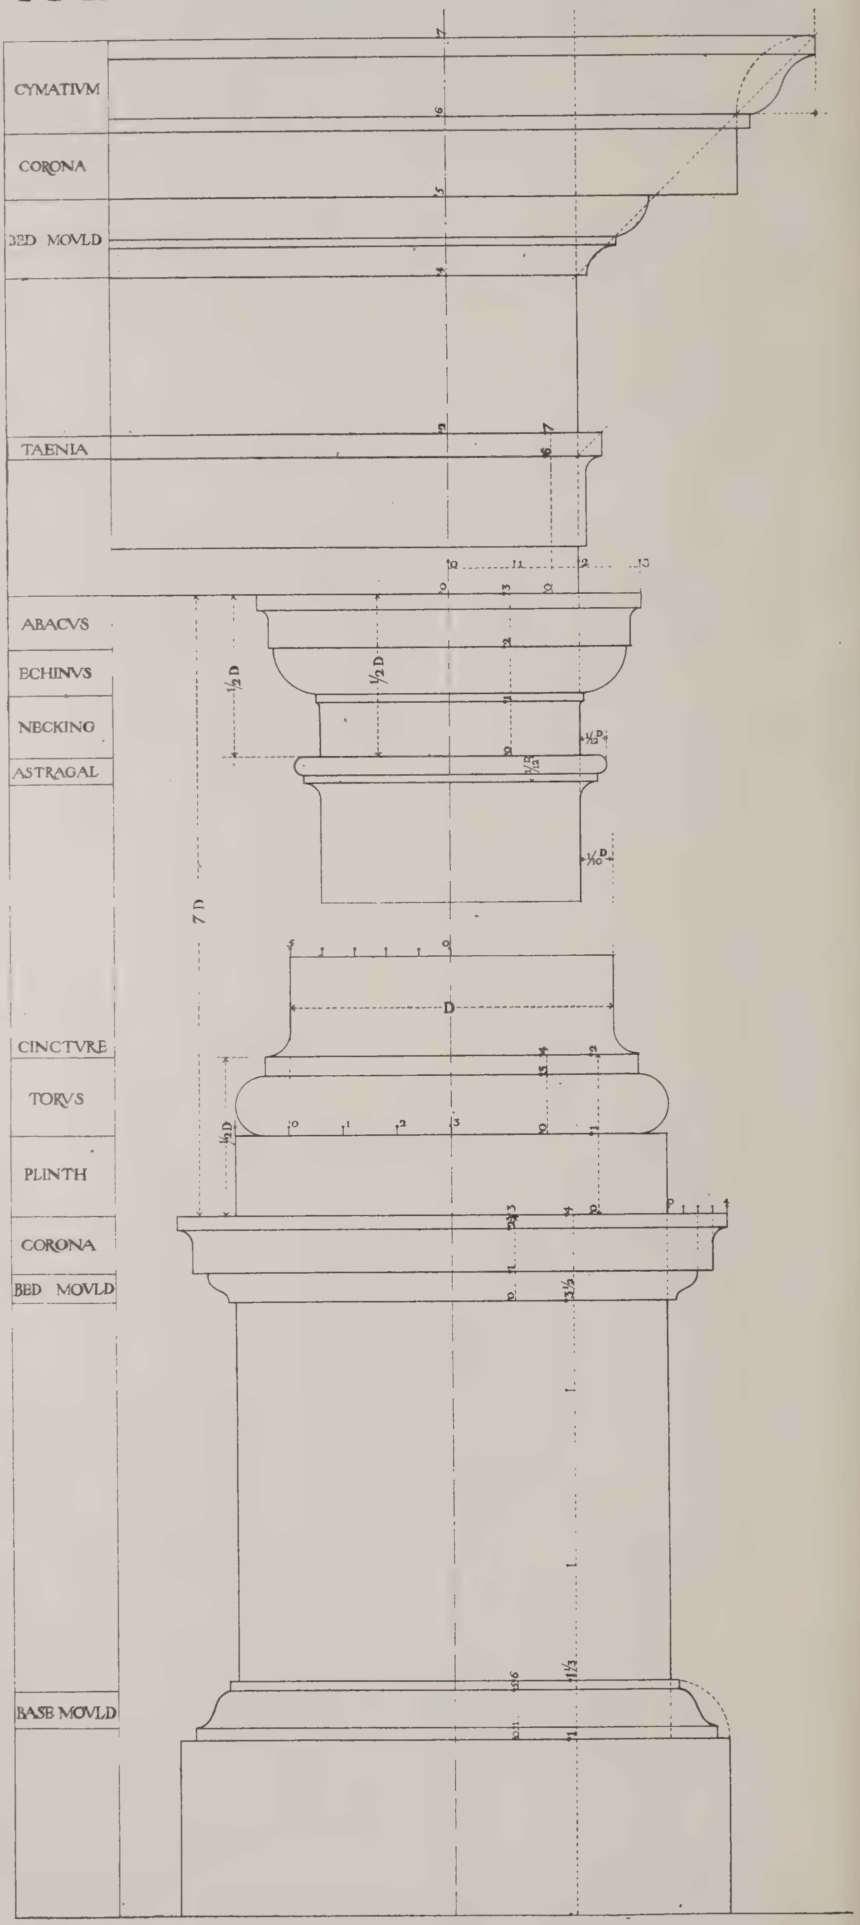
Plate III.

The Ionic Order shows smaller variations from the pure Classic examples than any other, and its proportions are fairly simple.

Two styles of cornice are, however, used, the modillion and the dentil cornice, and although the method adopted by Gibbs of giving prominence to the former has been followed, it should be stated that the latter is more generally found in old examples, whilst the former is preferred by Palladio.

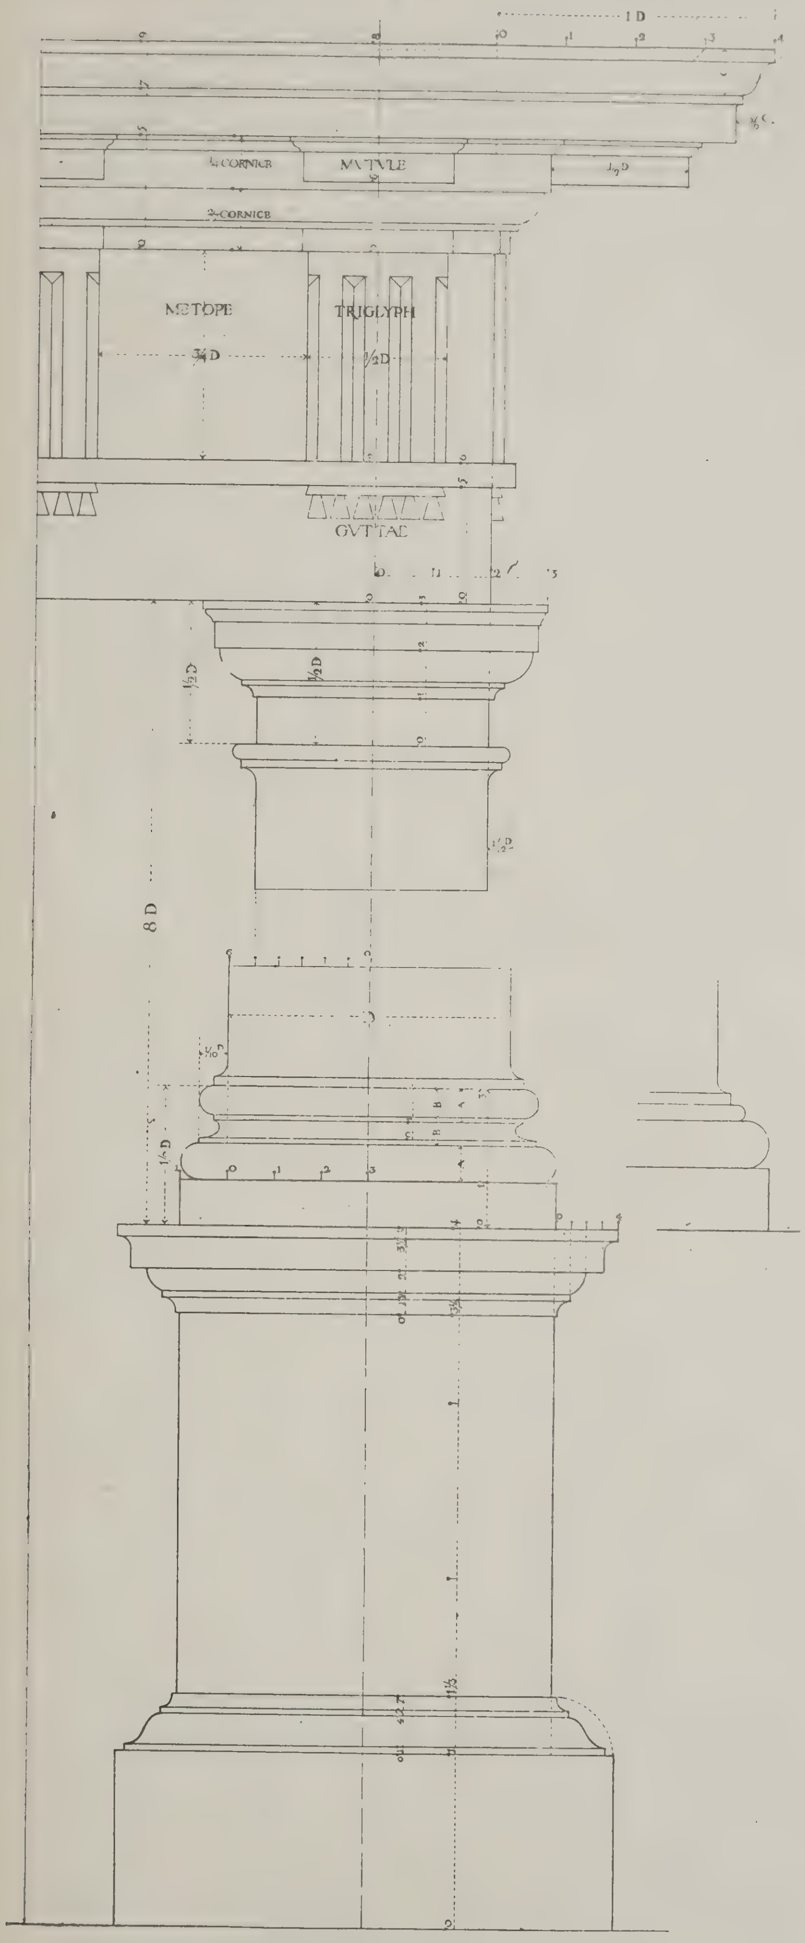
Represented side by side upon the plate the extent of the variation is easily discernible. A modillion or dentil should always be bisected by the centre line of the column and the spacing determined by the distance of this line from the frieze, as set out upon the drawing. The frieze is always plain and in larger works it is, preferably, kept flat. In smaller com-

THE ORDERS IN DETAIL



TVSCAN

PLATE: 2.



DORIC

positions, however, when narrow or when used over doors and windows a pulvinated frieze may be adopted with good effect.

The earlier alternative form of the Ionic capital in which the faces of the volutes are parallel to the plane of the elevation (not shown upon the drawings) may, of course, be substituted for the capital with angle volutes at 45°, though the latter has usually a much more graceful effect, particularly in small compositions. Of course, the geometrical method for setting out the volutes cannot be used in drawing such capitals in ordinary elevation. It should be noticed that the height of the capital in this Order is measured from the soffit of the volutes.

The centre of the eye is one-third of the height of the capital from its bottom and is in elevation placed just outside the top circumference of the shaft, while the horizontal fillet at the top of the shaft is immediately below the eye.

When the column is fluted the width of the fillets should be one-fourth to one-third that of the flutes. The flutes generally number twenty or twenty-four; in the latter case the simple method of setting them out on plan, as shown on the drawing, will be found of service.

The attic base is always used with the Ionic Order.

The Corinthian Order has been represented with considerable variations from the original type.

The Ionic entablature was often used by the ancients, supported by Corinthian columns, and the Corinthian cornice itself, though here represented with a dentil band, is often found without one. No general rule appears to exist for spacing the modillions or for their dimensions, the ratio of the width of the modillion to the space between two of them varying from 1 : 1½ to 1 : 2½, and again the number of the dentils between the modillions varies from 2 to 5 in different examples.

Both features should be symmetrically placed with reference to one another and to the centre line of the column, a point often neglected. To secure this result the following method is recommended:—Draw a modillion one-sixth of the diameter of the column in width, arranged symmetrically over the centre line of the column. Place another with its outside edge three and a-half times its width within the total projection of the cornice, and thus obtain the spacing between the blocks. Divide the distance between two modillion centres into 15 parts, give two to a dentil, to be placed symmetrically under a modillion, and one to each space between the dentils, which will be found to bring the inside edge of the last dentil before the return, on the frieze line.

The form and projection of the leaves of the capital are largely matters of individual taste, but the general method of their arrangement will be evident after examining the drawing. It may, however, be noted that the eye of the volute is just outside the lower circumference of the shaft, and that the tiers of leaves divide the capital below the abacus into three approximately equal horizontal sections.

The column may or may not be fluted as in the Ionic Order.

The attic base, as used in the Ionic Order, is very generally employed—in fact it is often preferable to adopt it, omitting the additional mouldings shown, for the sake of variety, on the drawing.

(To be continued.)

THE ORDERS IN DETAIL

CORINTHIAN

Views and Reviews.

Historic Ornament.

The character of this book, which has now deservedly arrived at a second edition, is accurately conveyed by the title. It has been considerably extended since the first edition, especially in the direction of architectural ornament. The book mostly consists of plates drawn by the author from examples of decorative detail, but general mass composition and planning in architecture are also dealt with. To the architect these two latter branches are of much interest, but the book is devoted to ornament and we cannot expect it to depart from its particular purpose. Together with the plates there are notes giving an historical summary of the derivation of the various ornamental forms, and incidental reference is made to some of the causes which led to their coming into being. The book does not deal with the anatomy and æsthetic laws of decoration, nor with the technique incidental to the special branches of work which have been the causal functions of types of decoration, *e.g.*, the influence of position and purpose, climate, material, and durability in the ornament of architecture, sculpture, furniture, textile fabrics and printing. Information is provided by Mr. Glazier which would be sufficient for a most enlightening critical treatment of the subject on such lines, and we wish that the author had gone out of his way to thus deal with the subject, however sketchily, for by so doing students would have been given a glimpse of the relation of the form to the determining causes, so that he would not be led to copy the decorations suited to one material, to one age, and to one country, in other materials, at the present day, and in other countries. Forms derived by thus working in one branch may be suggestive to workers in other branches, but there has never been in real living decoration anything in the nature of copyism, and the publication of such manuals as this has, in the past, tended more to produce copyism than to advance original thought; consequently, while we are willing to admit that this book is excellent as far as it goes, we could wish that the author had broadened its purview so as to direct the student (for whom the book is primarily intended) to the right road.

"A Manual of Historic Ornament," by Richard Glazier, Hon. Associate Royal College of Art, A.R.I.B A., headmaster of Municipal School of Art, Manchester. Second Edition. London: B. T. Batsford, 94, High Holborn, W.C Price 6s. nett.

Three Books Published Serially.

Not long ago we reviewed in volume form Prof. Adams's "Building Construction," which had been published originally by Messrs. Cassell & Co. in twenty-four weekly parts, a system apparently popular, for the publishers, in addition to now reissuing this book, have adopted the serial system with two further works, namely, "Engineers' Handbook" (also written by Prof. Adams) and "Carpentry and Joinery." The former promises to be a most valuable work. Under a slightly different title it has already passed through four previous editions, but has now been thoroughly revised and partly re-written in order to bring it up to date. It is intended to contain a series of memoranda such as we are accustomed to find in the class of publication generally called "a pocket book." It is, however, somewhat different to the ordinary "engineer's pocket book," for which Molesworth sets a very high standard, in so far that it endeavours to explain the derivation of formulæ; in fact it stands between the formula-book and the text-book, and may be rightly called an *aide-memoire.* It compares perhaps more with the two well-known American pocket books, Kidder's for architects, and Trautwine's for engineers, or with the German "Hütte des Ingenieurs Taschenbuch." The first part before us deals with the fundamental principles of engineering, and defines such terms as force, matter and motion, chemical laws and physical properties of matter, Newton's laws of motion and units of work and energy. The definitions consist mostly of quotations from authorities to whom reference is made. These quotations are very pointed and clear. The work undoubtedly deserves to be purchased by everyone in the architectural and engineering professions. The first part of the text-book on "Carpentry and Joinery" also holds out promise of being an excellent work when completed. It commences with a description of hand-tools and appliances, well illustrated by photographs from actual tools. A coloured plate is included illustrating the construction of a circular-headed casement window. This, however, is entirely out of place—an obvious fault to which we referred in reviewing the bound volume of Prof. Adams's "Building Construction." In future parts it would be well if the coloured plates were inserted in their proper position in the text.

"Engineers' Handbook, comprising Facts and Formulæ, Principles and Practice," by Prof. Henry Adams, M.Inst.C.E., M.I.Mech.E.
"Carpentry and Joinery," edited by Paul N. Hasluck.
"Building Construction," by Prof. Henry Adams.
(Each published in 24 weekly parts, price 3d. eachnett).

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Fees for Surveying.

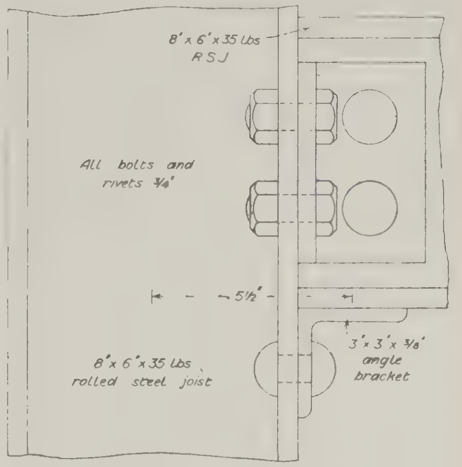
CURIOUS writes: "How should I make out a bill of costs for surveying several farms?"

See "Specification No. 9," price 2s. 6d. nett or 3s. 3d. post free from our offices.

Stanchion with Side Load.

YORKS.—R. F. writes: "Please show how to calculate the size of a rolled steel joist to act as a stanchion 15′ 0″ high, carrying 20 tons at one side on a 3″ bracket riveted to a flange at the top of the stanchion. Kindly give detailed sketch of bracket."

More information should have been given about the circumstances of the case—in fact, full particulars are necessary before any reliable answer can be prepared. Assuming that there is no other load upon the stanchion, and that it is so placed as to be unable to bend in the plane of the flanges, try a British Standard beam (B.S.B. 14) 8ins. by 6ins. by 35lbs. By the Rankine-Gordon formula, as used by the Cambria Steel Co., $\frac{\mathrm{FS}}{1+\frac{1}{a}\left(\frac{l}{\mathrm{T}}\right)^2}=\frac{50{,}000\times10{\cdot}29}{1+\frac{1}{36{,}000}\frac{(15\times12)^2}{10{\cdot}8}}=475{,}000$lbs. ultimate load. Allow a factor of safety of 4, then safe load $=\frac{475{,}000}{4}=119{,}000$lbs. = say, 53 tons, and $\frac{53}{10{\cdot}29}=$ say, 5 tons maximum safe working load per sq. in. Then the bracket being as in the accompanying figure, the maximum stress will be $\frac{\mathrm{W}}{\mathrm{A}}\pm\frac{\mathrm{M}}{\mathrm{Z}}=\frac{20}{10{\cdot}29}+\frac{20\times5{\cdot}5}{28}=2+4=6$ tons per sq. in., showing that the section is not quite large enough; but it would be waste of space to go further here, as the conditions are so indefinite.



Moment of Inertia of Trough Beam.

LLEWELLYN writes: "I send sections (not reproduced) of a trough. I tried to calculate the moment of inertia by using Molesworth's and Hurst's formulæ, but the results are very different. Where does the error lie? My object in working out the moment of inertia is to determine the moment of resistance given in Dorman, Long & Co.'s book—namely, 135·80. M.R. in inch tons 882·70, breaking pressure 28 to 32 tons per sq. in., and working pressure $6\frac{1}{2}$ tons per sq. in. Again, assuming the moment of inertia to be the same, I find that Molesworth's rule for obtaining $\mathrm{M.R.}=\frac{6\mathrm{KI}}{\mathrm{N}}$ or $\mathrm{M.R.}=\frac{\mathrm{MI}}{\mathrm{N}}$ and Dorman, Long & Co.'s rule $\mathrm{R}=\frac{\mathrm{I}}{n}$. The I and n in each case stand for the same quantities, and therefore I cannot see how the result can be made the same in each case."

Section modulus $z=\frac{\mathrm{I}}{y}$, where I equal moment of inertia and y = the distance from neutral axis to edge of section. Applied to the present case, $z=135{\cdot}8$ as given in Dorman, Long & Co's catalogue and $y=6{\cdot}5$, then $\mathrm{I}=zy=135{\cdot}8\times6{\cdot}5=882{\cdot}7$. By Hurst's approximate rule the result is bound to be less than the true figure; as shown it equals 844·04, but there are errors in the calculation; correcting these the result is 864·26. By Molesworth's method $\mathrm{I}=\mathrm{A}a=38{\cdot}0\times23{\cdot}48=892{\cdot}24$. In finding the area of the "inertia area" the scale must be allowed for; if drawn 2ins. to 1in. (half size) the actual result must be multiplied by $2^2=4$. In the working submitted for this method one side of the trough has been omitted. More care is necessary.

HENRY ADAMS.

Treads for Stairs.

PADIHAM.—CONSTANT READER writes: "What do you consider the best material for fixing on wood stairs in order to preserve same? The stairs are in a club where clogs are worn as well as boots. At the present time we have a combination of lead and some other hard material, but the members' clogs makes a loud noise on it."

We suggest the use of Gooding's patent interchangeable rubber stair treads, the wearing surface of which consists of india-rubber squares set in a metal frame. These squares can be renewed when worn. They are sold by Mr. William Gooding, of North Road Works, Holloway, N.

Entering Borough Surveyor's Office.

LONDON.—A. H. L. writes: "How should I set about entering a borough surveyor's or a borough engineer's office? What are the conditions of employment? How does one qualify as a borough surveyor or borough engineer?"

Get "How to Become a Municipal Engineer," by J. Freebairn Stow (price 1s. nett, from our offices).

Claim in Respect of Drain.

LONDON.—R. T. F. writes: "A friend of mine purchased a new house and had not been in occupation long before his boy was stricken with diphtheria. The child had this three times, and it was found at last to have been caused by an old disused drain. Who was to blame, and can compensation be claimed?"

We cannot express a definite opinion without much fuller details, and, therefore, recommend you to consult a solicitor.

Concrete Block Cottages Roughcast.

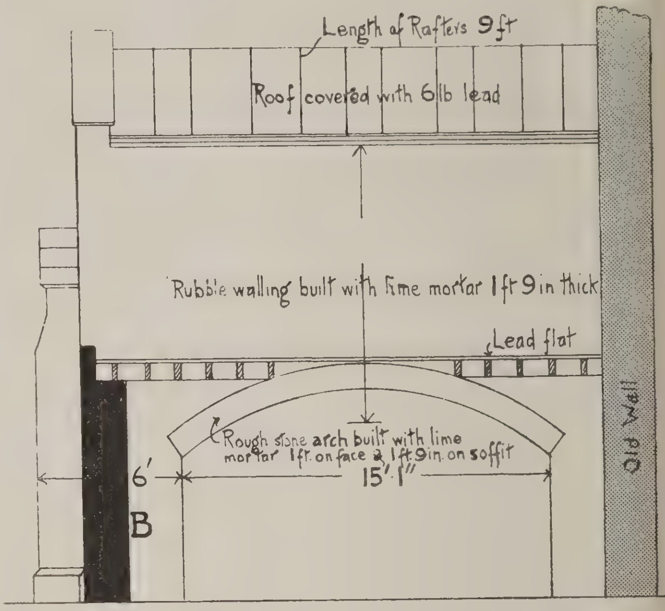
S. F. writes:—"(1.) Would concrete blocks covered with roughcast be suitable for a labourer's cottage near the sea? (2.) Must cement concrete be used, or would lias lime serve the purpose? (3.) What size is most convenient for the blocks? (4.) Would the cost be less than if using bricks and roughcast?"

(1.) Yes, especially if made hollow and plastered inside. (2.) Portland cement should be used. (3.) It depends upon appearance, and whether a machine with standardised moulds is used, or whether the blocks are moulded in wooden boxes without the use of machinery. In any case the blocks should be made of regular sizes so as to bond with each other, and it is more economical to adopt a size which can be easily handled by a man without the use of lifting appliances. (4.) It depends upon the cost of bricks at the nearest brickworks and the cost of carriage. If the bricks cost more than 20s. on the site, it would probably be cheaper to use concrete blocks, but it depends a good deal on the knowledge of the builder and control of the workmen, and without experience in concrete blocks it would probably be cheaper to use bricks for one cottage.

Book on School Buildings.

LONDON.—H.C.P. writes: "Please recommend book on school construction and design, with information on air-space, height of rooms, windows, &c.?"

"Modern School Buildings," by Felix Clay (price 25s., post free, from our offices).



Length of Rafters 9ft

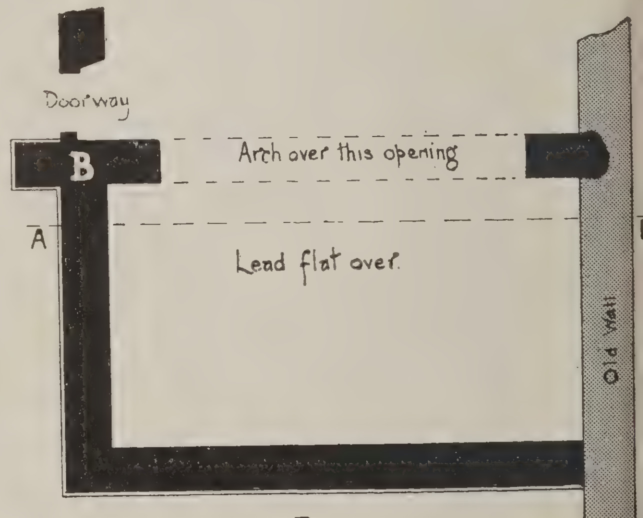
SECTION ON A-B



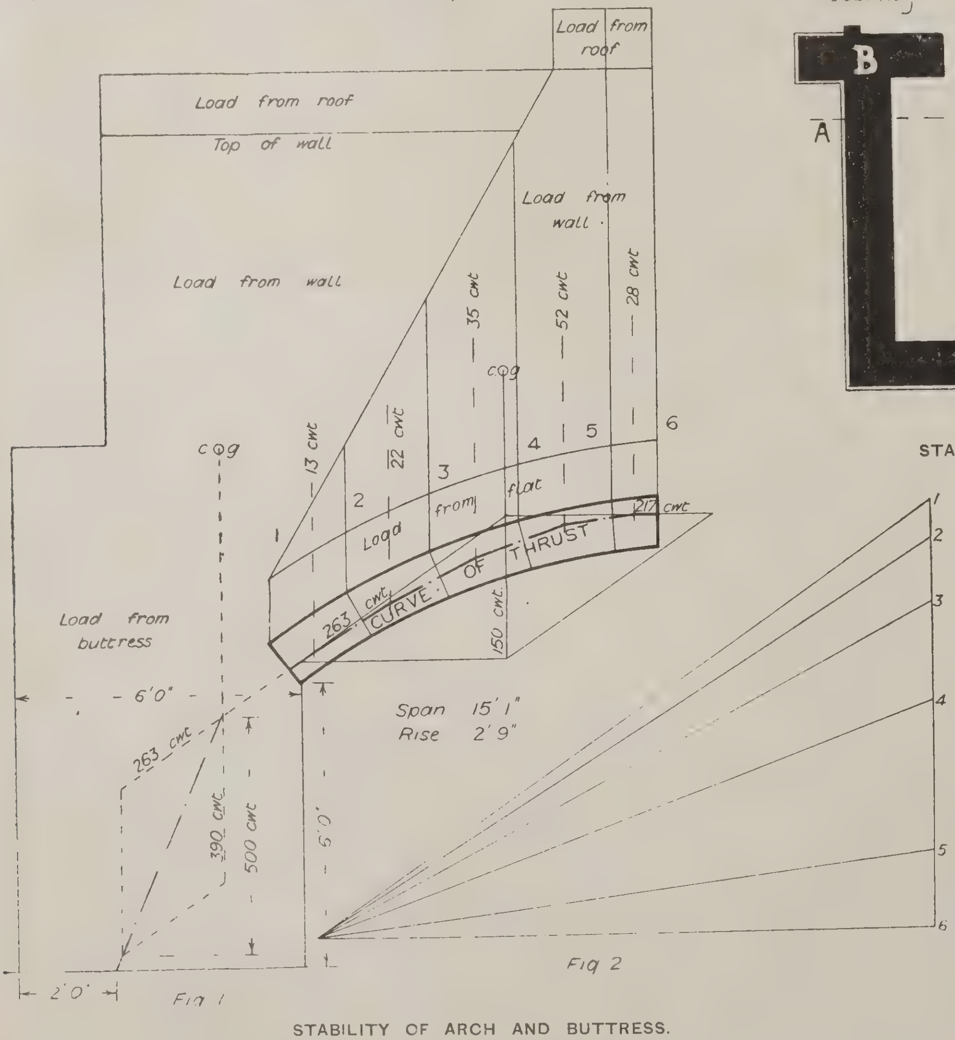
PLAN

STABILITY OF ARCH AND BUTTRESS.

Stability of Arch and Buttress.

YORKS.—G. W. B. writes: "The accompanying sketch shows an addition to a small parish church which we are at present erecting. I am doubtful whether the arch is safe, and, in particular, whether the abutment marked B on plan and section is strong enough to take the thrust. Please express your opinion on the construction proposed, and also inform me of the name of any work I can refer to on the subject."

Figs. 1 and 2 show the method of calculating the thrust upon the arch. It will be seen that the pier B is not strong enough, and its dimensions should be increased. The pressure in the arch is considerable, and it would be advisable to use a hard stone set in Portland cement mortar. As regards a book of reference, we suggest Rivington's "Notes on Building Construction," Vol. IV.



STABILITY OF ARCH AND BUTTRESS.

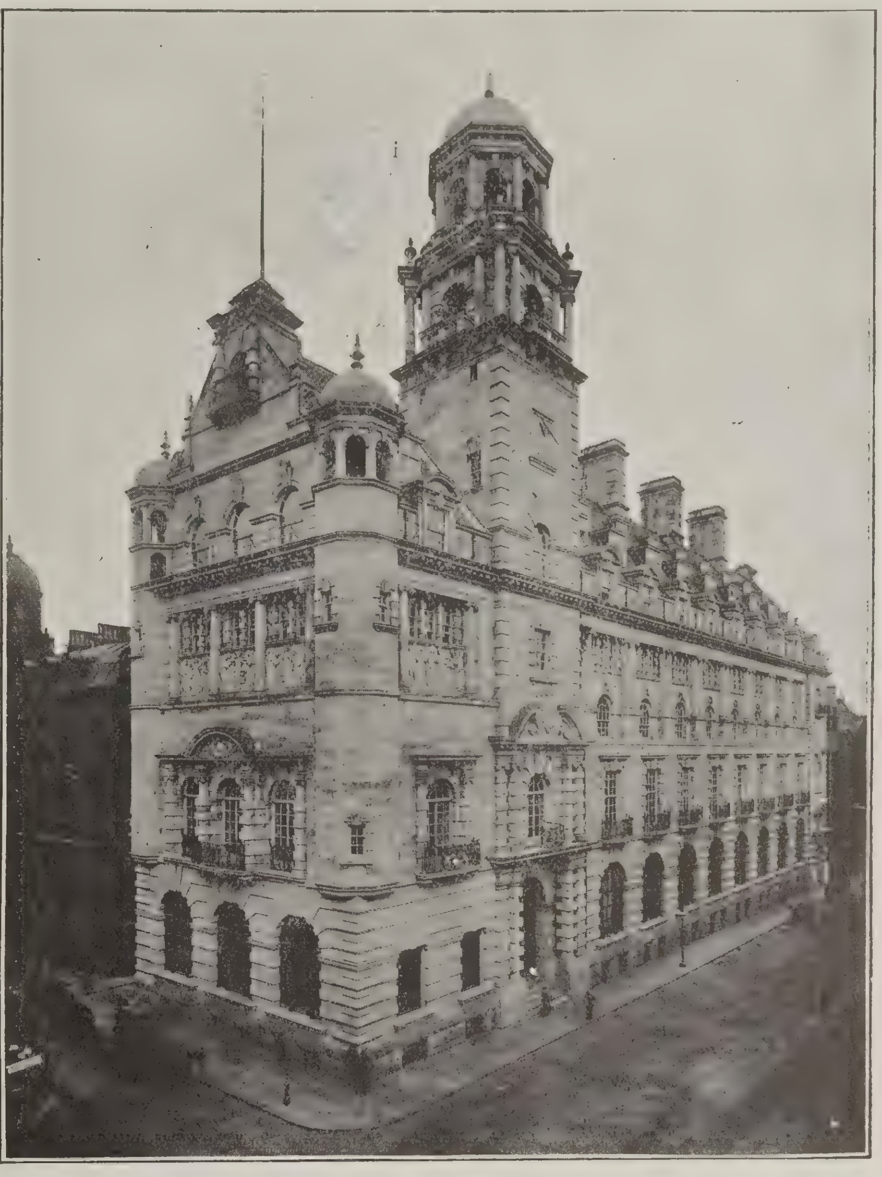
NEW BUILDINGS IN LIVERPOOL.

LIVERPOOL is pre-eminently a modern business city; indeed, it is said to be perhaps the most go-ahead city in the country. The facilities for getting about it are certainly very complete, Liverpool having been first in the United Kingdom to provide a municipal tramway service with electric cars, while the ferries across the Mersey to Birkenhead and other growing districts are also excellent.

When speaking of the buildings of Liverpool, one has perforce to give premier place to St. George's Hall—that splendid work of a young English architect, Elmes, carried to completion with scholarly ability by Cockerell, after the architect's death. But Liverpool has many other notable buildings, the majority of which are to be found within the small area which forms the chief business centre. Here is to be seen much work of conspicuous merit, and architects in other parts of the country would find it worth while to see it for themselves. From London there is, of course, the very admirable service of the London & North Western Railway, which puts Liverpool within a little over three hours and a half of the metropolis.

The purpose of this present article is to show the most important new structures which have been erected in Liverpool, and we have had to make a definite distinction between what may properly be called new, and what is of yesterday. Such buildings as St. George's Hall, the old Town Hall, the Exchange, the Municipal Offices, the Museum and the Walker Art Gallery are quite outside the scope of this article, as also are the Post Office (completed in 1894 from Sir Henry Tanner's designs), Mr. Mountford's fine block of the technical schools, completed in 1900, and Mr. Norman Shaw's two buildings—the White Star offices, fondly reminiscent of New Scotland Yard (Mr. J. Francis Doyle was joint architect with Mr. Shaw for this building), and Parr's Bank in Castle Street, for which Messrs. Willink & Thicknesse were joint architects with Mr. Shaw.

VIEW DOWN DALE STREET.



ROYAL INSURANCE BUILDING, DALE STREET. J. FRANCIS DOYLE, F.R.I.B.A., ARCHITECT, R. NORMAN SHAW, R.A., ADVISORY ARCHITECT.

The Royal Insurance Building.

As a starting point we have taken the huge block of the Royal Insurance Co. erected at the corner of Dale Street and North John Street from the designs of Mr. J. Francis Doyle, of Liverpool, with whom was associated Mr. Norman Shaw as "advisory architect." This replaces a former building of the Insurance Company on the same site, built at the beginning of the 19th century. Carried out in Portland stone it masses up well, more especially from North John Street, where the colonnade on the second and third floors is particularly effective; the balconies, too, are very good. The tower of the building does not strike us as being so successful as other parts. It would, we think, have been better to have omitted the lower stage altogether, and carried up the tower solid. The cupola is gilded, adding a lively piece of colour to the building.

The sculpture frieze running across the upper part of the Dale Street front, and on the return to North John Street, was executed by Mr. C. J. Allen, under Mr. Doyle's direction, and represents Insurance in alliance with Commerce, Science and Art. The frontage to North John Street is over 215ft., and to Dale Street 55ft., the height to the ridge of the roof being 110ft., and to the top of the cupola 160ft. Within the building there are many fine rooms. The chief of these is the general office on the ground floor, which has a very elaborate plaster ceiling with rich panelling round the walls, and marble and mosaic in profusion. There is no column to break up the general floor space, deep girders having been carried across from wall to wall and trusses put in above. Marble has been extensively used for the staircases, and windows are filled with stained glass; consequently the building has an air of extreme richness. Of the various rooms on the upper floors the finest is the board-room, 44ft. by 24ft. 6ins. by 27ft. 6ins. high. The ceiling here is barrel vaulted and embellished with fine plaster work, while the walls, for a height of 19ft., are panelled with magnificent walnut. The panelling is quite plain, and, by contrast, the pillared doorway and fireplace have an imposing effect. The firegrate is

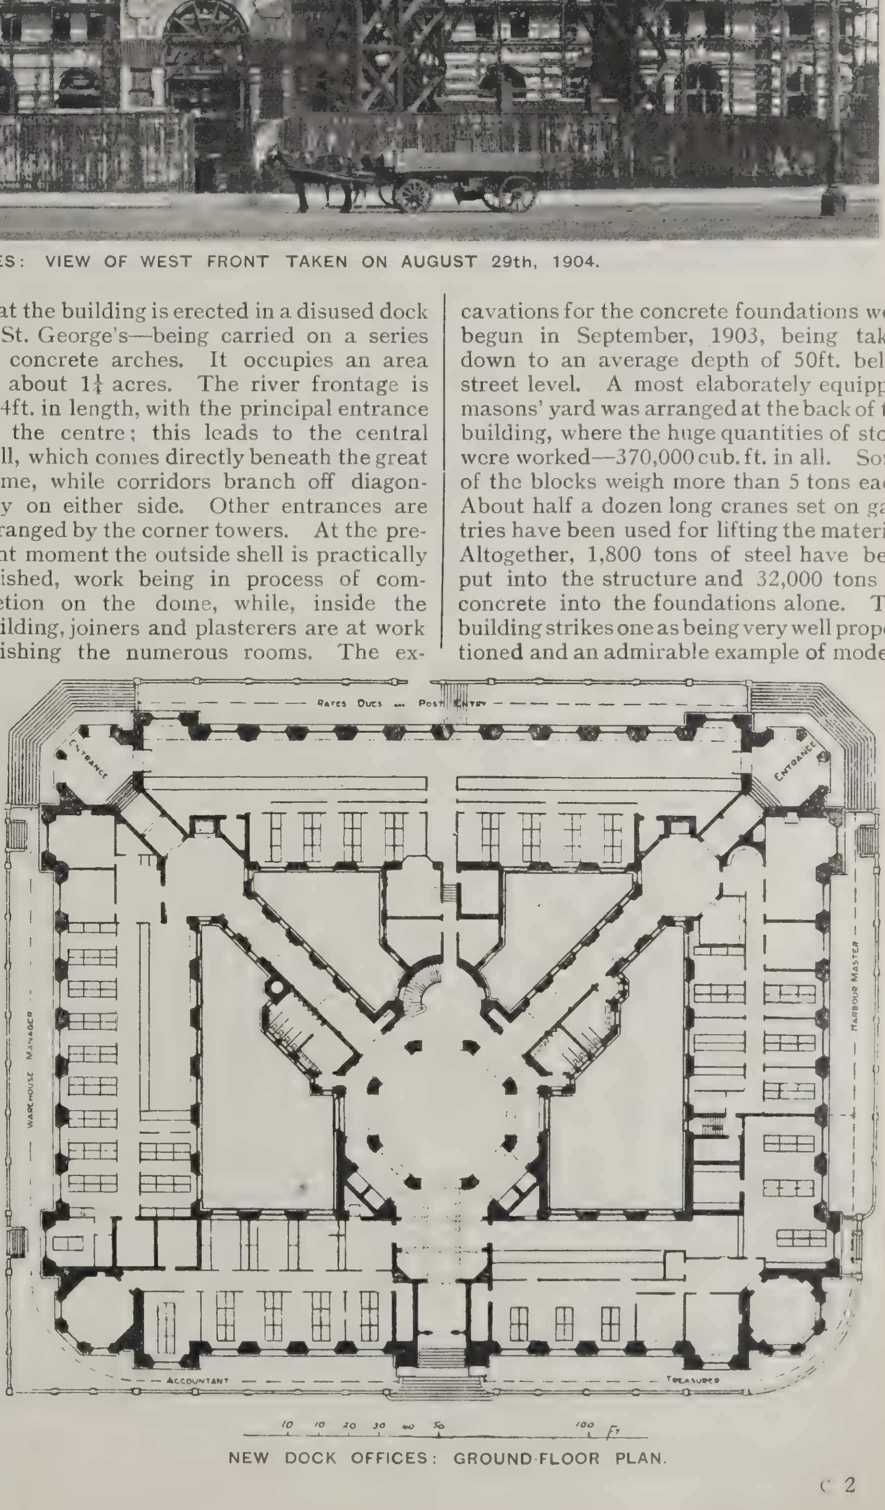
NEW DOCK OFFICES: VIEW OF WEST FRONT TAKEN ON AUGUST 29th, 1904.

interesting as being the work of Alfred Stevens, while the three chandeliers are antique, having been made in Utrecht in 1647 and 1649. This building of the Royal Insurance Co. was commenced in 1897 and partly occupied in 1900, but it was not until June, 1903, that the directors used their new board-room.

The New Dock Offices.

Since that date many important works have been carried out in Liverpool, several large buildings being now in process of erection. Undoubtedly the most important is the great block of offices for the Mersey Docks and Harbour Board. This is the outcome of a limited competition in which Messrs. Briggs & Wolstenholme, F. B. Hobbs & Arnold Thornely were the successful architects. In the majority of cases, owing to the necessarily high cost of land, large city buildings are unfortunately not set on such sites that the general effect can be adequately seen. In London, for example, there is the case of the Law Courts in the Strand, and the more recent case of Westminster Cathedral, both of which buildings are on sites inadequate for the best architectural effect. With the new Dock Offices at Liverpool, however, the case is different, for this great block occupies an open site facing the Mersey and can be seen all round to the best advantage. The plan of the building is, roughly, a square, with a huge dome set in the centre, and towers at each corner. The building is partially of steel construction, and in most instances the steel has been encased in concrete. The facades are carried out in Portland stone, with the exception of the ground-floor portion of the north-east and south-east angle towers, which portion is of granite from the Dock Board's quarry at Kirkmabreck, in the South of Scotland; as also the boundary wall surrounding the building. The great centre dome is 74ft. in diameter at the base, and the top of its cupola is 223ft. from pavement level. It is interesting to note that the building is erected in a disused dock—St. George's—being carried on a series of concrete arches. It occupies an area of about 1¼ acres. The river frontage is 264ft. in length, with the principal entrance in the centre; this leads to the central hall, which comes directly beneath the great dome, while corridors branch off diagonally on either side. Other entrances are arranged by the corner towers. At the present moment the outside shell is practically finished, work being in process of completion on the dome, while, inside the building, joiners and plasterers are at work finishing the numerous rooms. The excavations for the concrete foundations were begun in September, 1903, being taken down to an average depth of 50ft. below street level. A most elaborately equipped masons' yard was arranged at the back of the building, where the huge quantities of stone were worked—370,000 cub. ft. in all. Some of the blocks weigh more than 5 tons each. About half a dozen long cranes set on gantries have been used for lifting the material. Altogether, 1,800 tons of steel have been put into the structure and 32,000 tons of concrete into the foundations alone. The building strikes one as being very well proportioned and an admirable example of modern

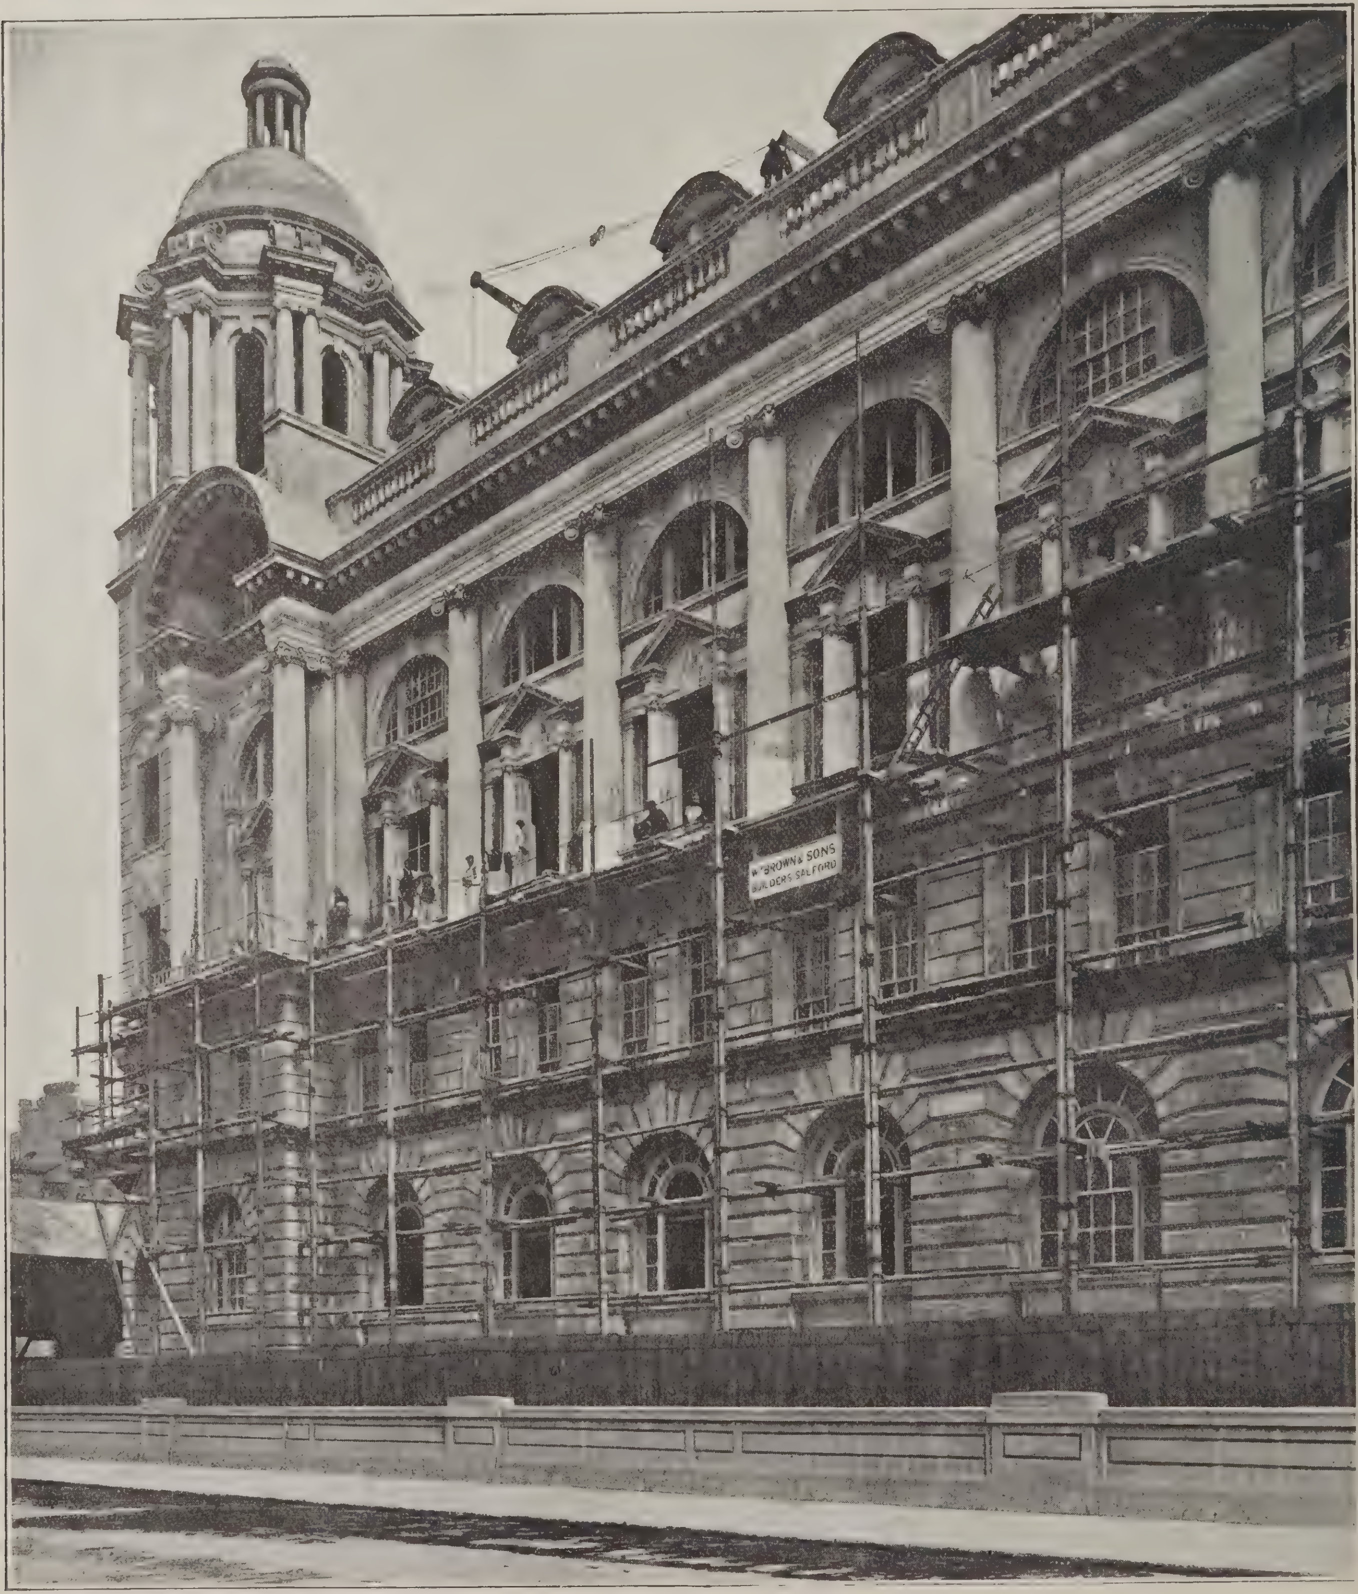


NEW DOCK OFFICES: GROUND-FLOOR PLAN.

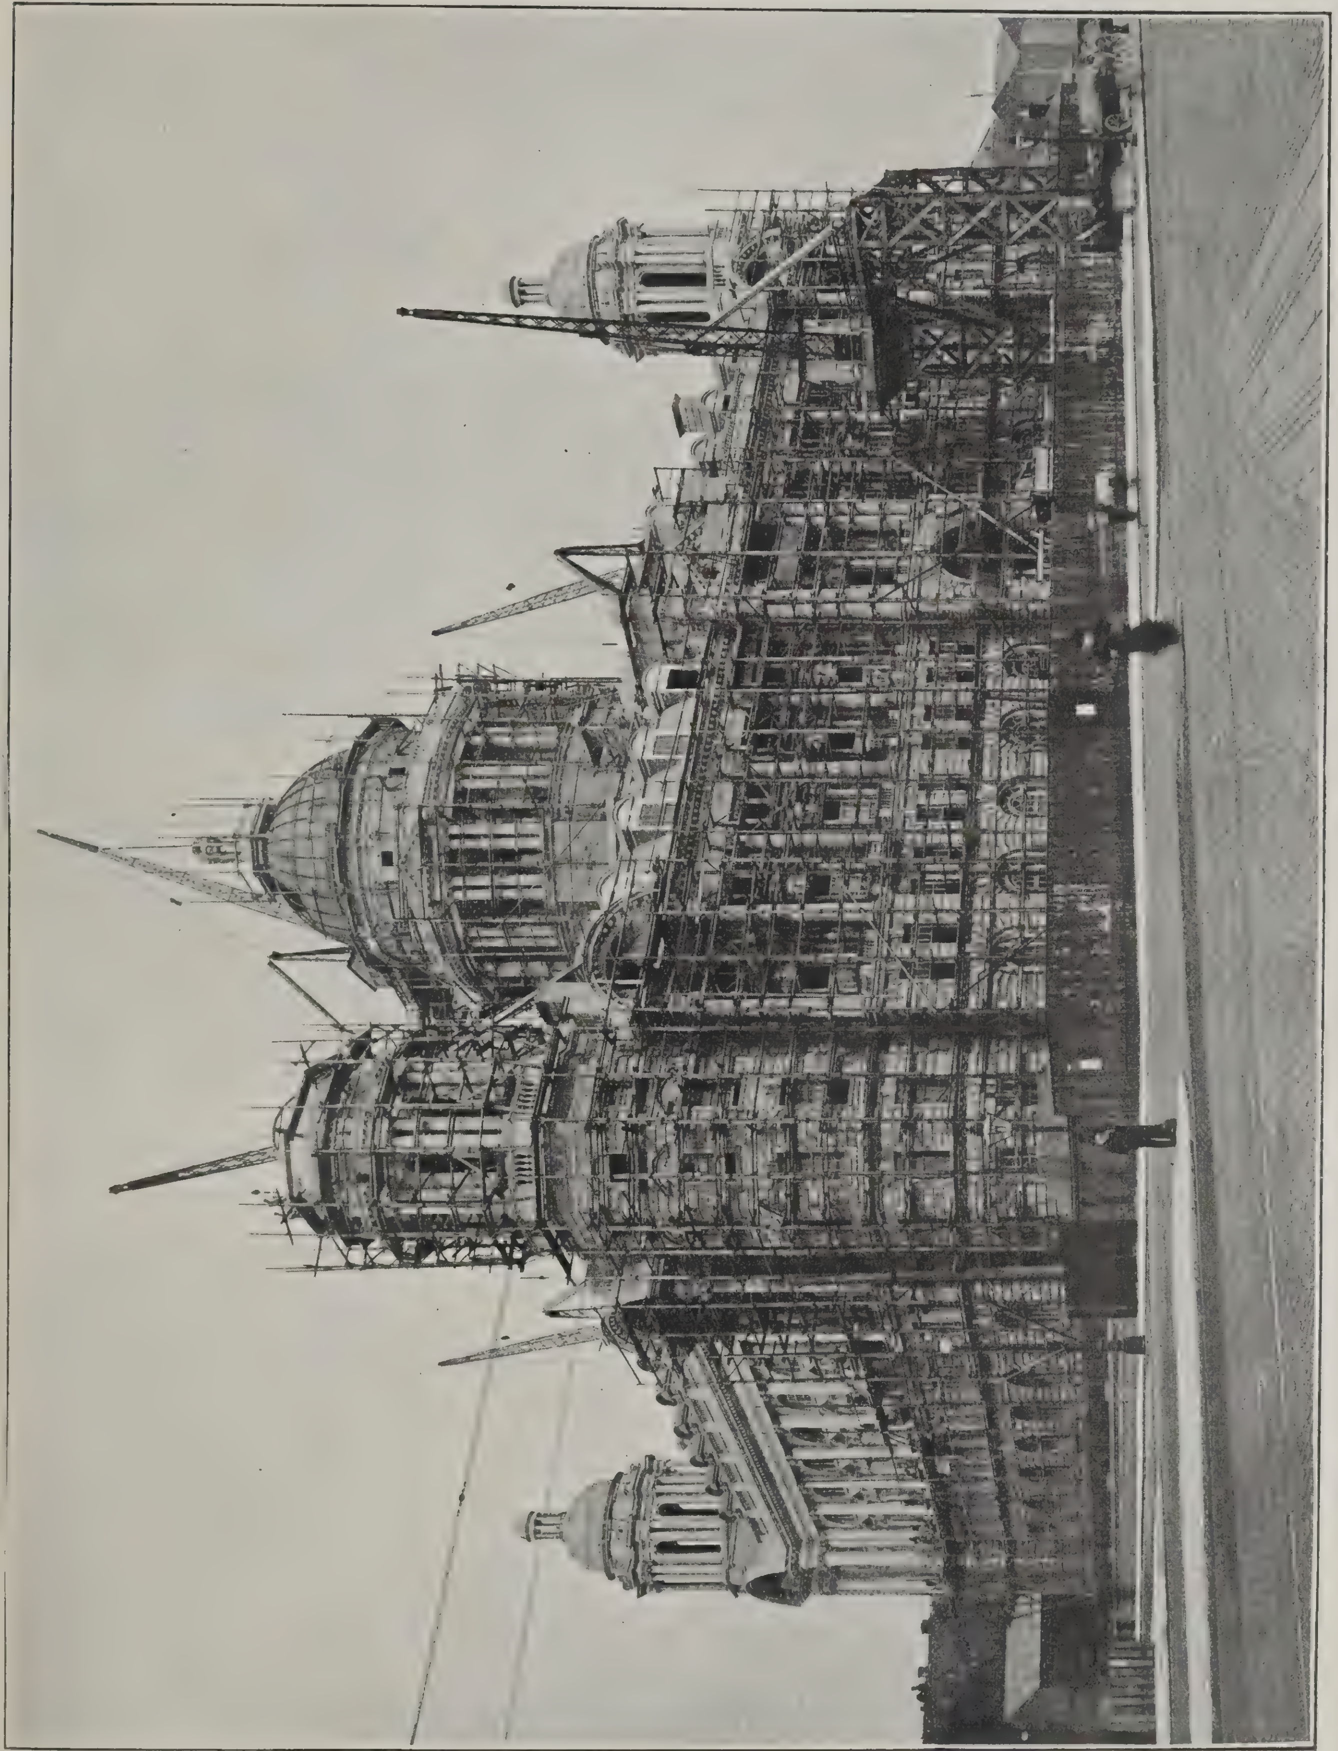
English Renaissance. In point of size it is not quite so large as the new War Office in London, but in monumental effect it far excels the latter. The design of corner towers is always a matter of particular difficulty, but in these new dock offices we think the architects have been very successful. The contract for the building was entrusted to Messrs. William Brown & Sons, of Trafford Road, Salford, Manchester, who have executed the work in a most creditable manner. The sub-contractors, who have given every satisfaction, are :—

Slating, plastering, and fibrous work, Messrs. Waterhouse & Dondy, Liverpool; *plumbing, glazing, and sanitary fittings*, Messrs. Mellowes & Co., Sheffield; *boilers, heating, and ventilation*, Messrs. Ashwell & Nesbit, Ltd., Leicester; *stone carving*, Messrs. Earp, Hobbs & Miller, Messrs. Norbury & Co. and Mr. E. O. Griffiths; *sculpture work*, Mr. C. J. Allen, Liverpool; *marble work*, Messrs. John Stubbs & Sons, Liverpool; *terrazzo floors*, Messrs. Diespeker, Ltd., London; *metal casements, leaded lights, railings and gates*, Messrs. George Wragge, Ltd., Salford; *wood-block flooring*, Messrs. Roger Lowe & Co., Ltd., Farnworth, Bolton; *copper dome*, Messrs. Ewart & Sons, London.

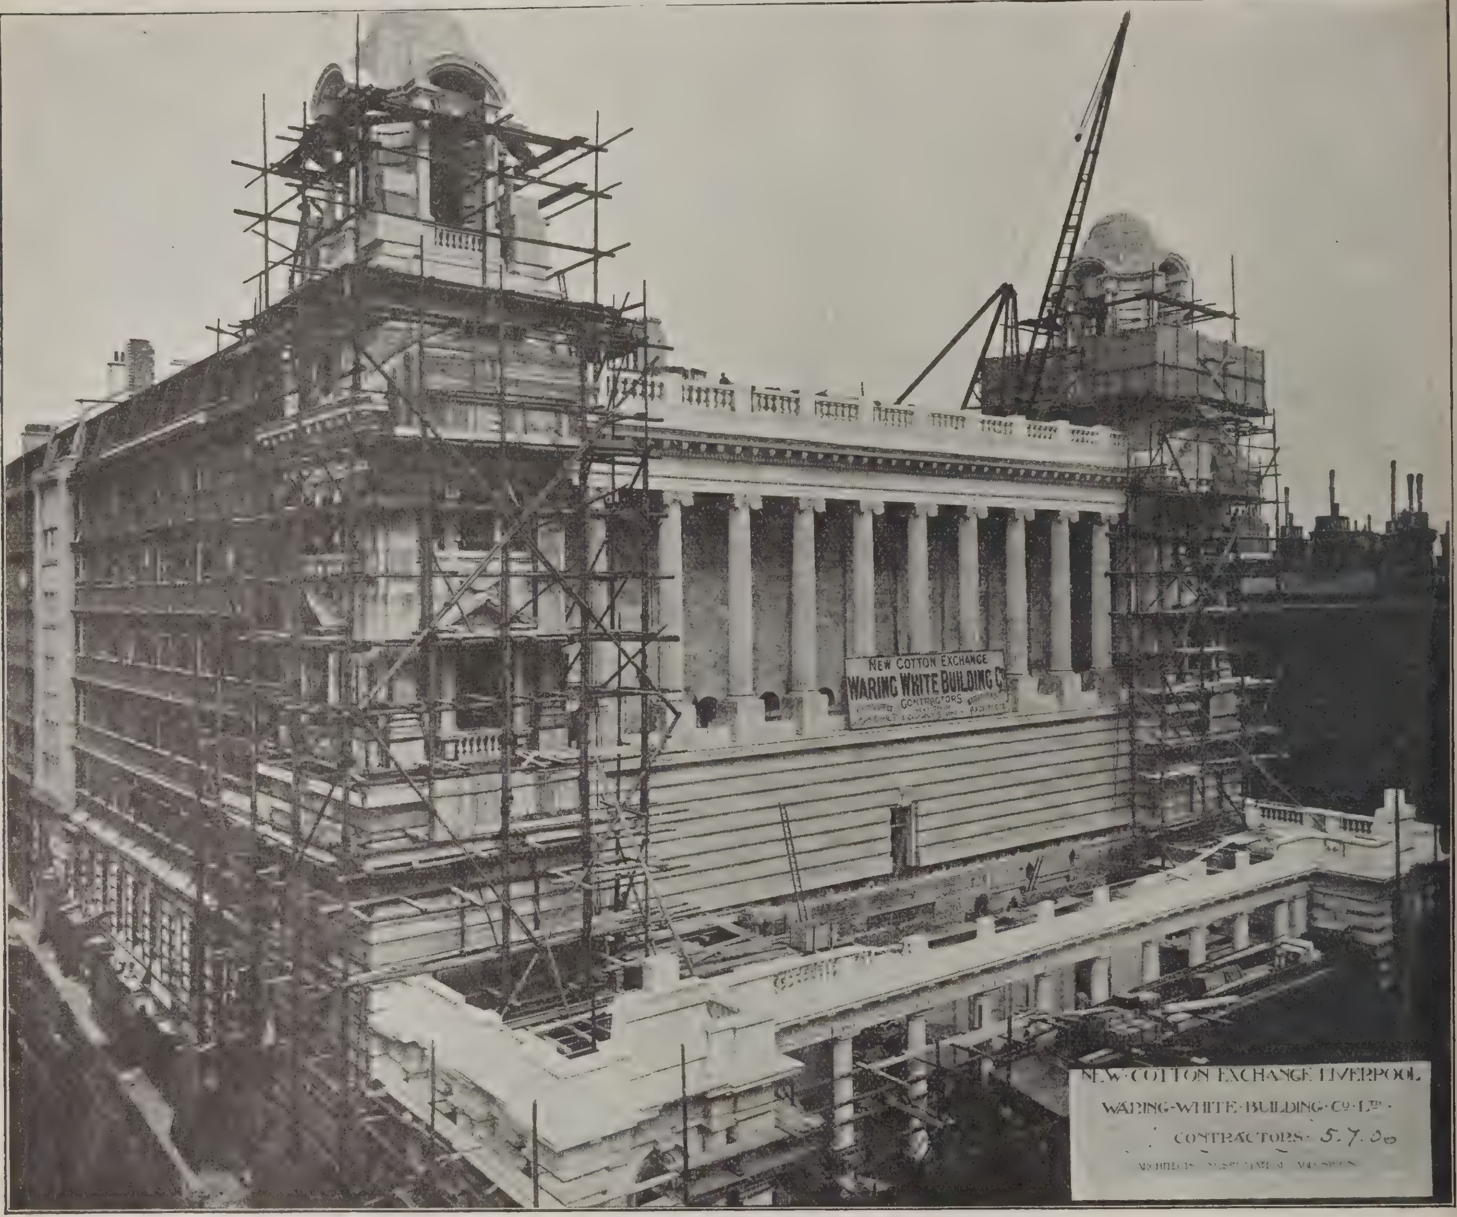
The whole of the work has been carried out under the direct supervision of Mr. W. S. Latta, clerk of works. It is expected that the contract will be all completed by the end of this year—three months within the stipulated time—a speed record for a building of such immense proportions and classical design. The cost, including fittings, will be about £300,000. The basement of the building is occupied by store rooms; the ground floor with offices for the treasurer, rates and dues, &c.; the first floor with the general office and statistical department; the second floor with offices for the manager, solicitor, &c., as well as the board-room (which is panelled out in mahogany); the third floor with departmental offices and members' dining-room, &c.; and the top floor with rooms for the caretaker.



NEW OFFICES FOR THE MERSEY DOCKS AND HARBOUR BOARD: PORTION OF NORTH FRONT AND CORNER TOWER.
BRIGGS & WOLSTENHOLME, F. B. HOBBS & ARNOLD THORNELY, ARCHITECTS.



NEW OFFICES FOR THE MERSEY DOCKS AND HARBOUR BOARD.
BRIGGS & WOLSTENHOLME, F. B. HOBBS AND ARNOLD THORNELY, ARCHITECTS.



MATEAR AND SIMON, FF.R.I.B.A., ARCHITECTS.

Adjacent to the new dock offices it was proposed that new baths and tramway offices should be erected, and about three years ago the Corporation held a competition, the first premium being awarded to Messrs. Stones & Stones, of Blackburn, and Mr. W. Edwardes Sproat, of Liverpool, joint architects. This competition, however, was a fiasco, because it was decided later to abandon the scheme, the Baths Committee and the Tramways Committee each to submit a scheme of their own for the dock site "or elsewhere." New baths will certainly have to be built, as the present baths are unsatisfactory, and have to be closed within a year. So far as the George's Dock site goes, however, the latest news is that the Royal Liver Friendly Society has acquired the northern portion of it, between Water Street continuation and St. Nicholas's Place, and will there erect new offices. £70,000 is given as the cost of the site, while £300,000 is spoken of as the cost of the building.

The New Cotton Exchange.

The next most important new building in Liverpool is the new Cotton Exchange—in course of erection in Old Hall Street. The architects of this building are Messrs. Matear & Simon, FF.R.I.B.A., of Liverpool, whose design was selected in competition in 1904. The contractors are Messrs. The Waring White Building Co., Ltd., who are making remarkable progress. It is only just over a year since they commenced work on the site, yet the shell of the building is now complete, and work on the interior well forward. About 700 men are employed on the job. The design of the front of this building is very fine; the scheme of the colonnade against the blank wall that shields the exchange roof from view, with the well-proportioned towers at either end, and the loggia stretching low across the front, being most effective. This front is quite different to the usual kind of work, and will make the building a great addition to Liverpool. The north elevation is also noteworthy by reason of the fact that it is carried out almost entirely with a facing of cast iron. On this side of the building are placed a number of cotton sale-rooms, for which it is imperative to have an even, unobstructed light. It was found that by using cast-iron attached to the steel frame, instead of having stone piers, a great reduction in width was effected between the windows, and a corresponding reduction of shadow—a very important matter in cotton judging: this cast-iron work also enables the thickness of the walls to be reduced. Altogether about 17,500 ft. super. of cast-iron have been used. Within the building the exchange hall (140ft. by 128ft.) occupies the main space. This hall is carried to the top of the building, and lighted through a large glass roof, below which, over the cornice level, there is some excellent enriched plaster work, by Messrs. Henry Johnson & Sons, of Liverpool, while on the two floors below are colonnades, the columns being monoliths of granite, 13ft. 6ins. high, with marble bases and capitals. These columns have been supplied by Messrs. A. & F. Manuelle, of London, who have also executed marble pavings, doorways, &c., in the building. The lighting of the exchange hall is being carried out by the Northern Electrical and Ventilating Co., of Liverpool: there will be 500 electric lamps, and the light from these will be reflected, which is much more pleasing than the ordinary system of "point" lighting.

The floors and partitions throughout the building have been carried out by the Fram Fireproof Construction Co., of Manchester. The floors are formed with slightly cambered concrete blocks, made with a specially prepared fire-resisting concrete, which are fitted in between the rolled steel joists without the use of any kind of centering. The floors can be used immediately after laying, so that much time is saved by this form of construction. The partitions in the building are formed with Fram partition slabs about 3¼ ins. thick.

Altogether about 3,000 tons of steel have been used in the building. Round about the exchange hall the various rooms are grouped, the smoking-room and reading-room being panelled in walnut and the board-room in oak. In the basement a restaurant is to be fitted up. A complete system of lifts has been installed—twelve in all—by the Easton Lift Co., Ltd., of Westminster, and it is worth noting that the cars have been designed by the architects. The wrought-iron enclosures of the lifts are also interesting examples of design; they have been executed by Messrs. George Wragge, Ltd., of Manchester, who have also been entrusted with the stained and leaded glass work in the building, as well as the metal ceiling light and glass over the exchange hall. The total cost of the building will probably be about £210,000. Mr. S. K. Sheldon is the chief clerk of works.

The following is the list of the sub-contractors:—

Steelwork, Ed. Wood & Co., Ltd.; *flooring, partitions and ceilings*, "Fram" Fireproof Construction Co.; *lifts*, Easton Lift Co.; *heating and ventilating*, Ashwell & Nesbit; *marble and granite*, A. & F. Manuelle; *plumbing, painting and joinery*, Waring & Gillow; *slating and plastering*, Henry Johnson & Sons; *sanitary fittings, closet divisions, wall tiling, and dados on tower staircases*, Doulton & Co.; *ornamental ironwork*, Walter Macfarlane & Co.; *steel casements and patent glazing*, Henry Hope & Sons; *marble balustrade*, Emley & Son; *electric wiring, &c.*, Northern Electrical & Ventilating Co.; *lift enclosures, ceiling lights in main hall*, George Wragge, Ltd.; *mosaic flooring*, Diespeker, Ltd.; *tiling*, Martin Van Straaten & Co.; *tiling*, George Swift; *sculpture*, Birnie Rhind; *carving and sculpture*, E. O. Griffiths; *35 instruments*, Private Wire and Telephone Installation Co.; *wrought iron gates*, Ockleston & Drayton Johnson; *asphalting*, London Asphalte Co.: *wood block flooring*, J. F. Ebner; *lightning conductors*, S. B. Bidder & Co.

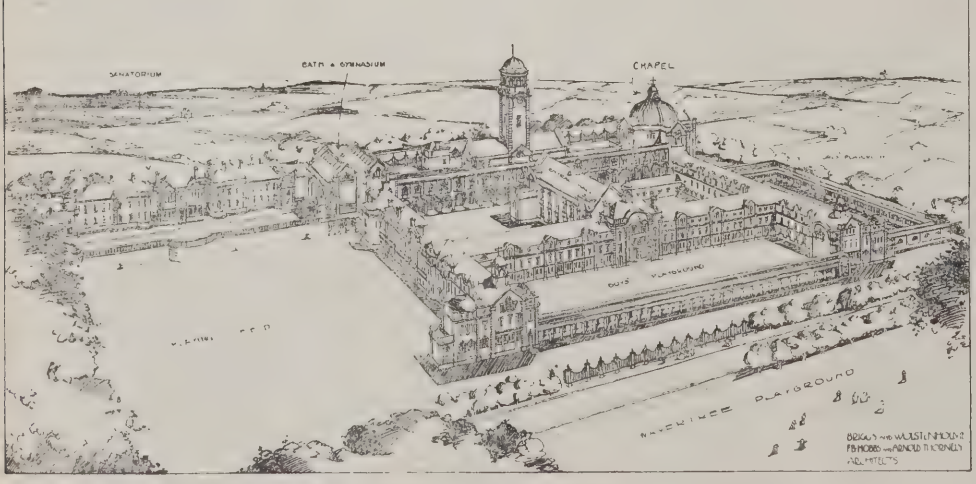
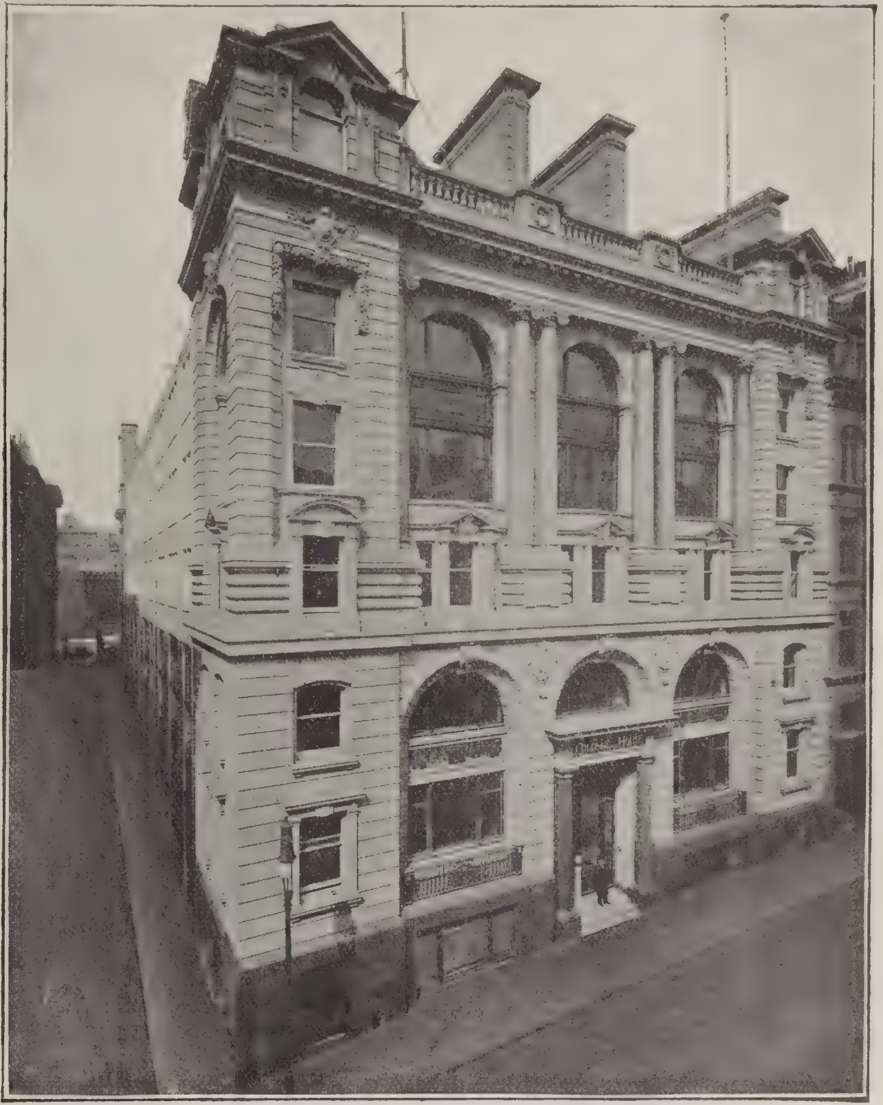
BOARD ROOM, NEW BLUECOAT SCHOOL.
BRIGGS & WOLSTENHOLME, F. B. HOBBS & ARNOLD THORNELY, ARCHITECTS

Another important new Liverpool building is the new Bluecoat School at Wavertree, one of the suburbs of Liverpool. The architects are Messrs. Briggs & Wolstenholme, F. B. Hobbs & Arnold Thornely, their design having been selected in a competition restricted to local architects. In connexion with this competition the trustees stated that, while not wishing to curb individual choice of style, they were desirous of recalling the architectural character of the front of the old Bluecoat Hospital, which remains still in School Lane, behind St. Peter's Church; it was erected in 1708, and is a good example of Georgian work (it is open for sale to anyone who wants the site). The new school provides accommodation for 250 boys and 150 girls. It is carried out in 2⅝-in. red Ruabon bricks with Grimshill stone dressings, and the roofs slated. The complete scheme is not yet carried out, as a gymnasium and swimming bath are to be erected at one side of the main front, opposite the chapel, and further north a sanatorium in connexion with the school is to be built; while the tower shown in the accompanying sketch has also to be added. On the ground floor of the centre block behind the main front is the dining-hall, very effectively lined with green-stained whitewood, treated squarely and architecturally, the ceiling being of plaster, enriched somewhat, and the floor of wood blocks. Above this room is what is called the Shirley Hall (75ft. by 46ft.). This commemorates the founders of the school, and is used for services. It also is panelled throughout with whitewood, left plain; the ceiling is barrel-shaped, and the organ at one end of the room is from the old school. The dormitories in the building do not call for any special comment, but the arrangement of the lavatories is certainly worthy of special mention. The basins are set around the walls and in series across the room, but the special feature is the arrangement of towel holders. To an outsider the matter might not appear to be of much import, but the managers of the school have experienced considerable difficulty in respect of towels. Various arrangements have been tried, such as rollers, &c., but the system of having a towel for each boy and each girl hung on its own special bracket has been found to be the best. At one side of the main front of the school is the chapel. This is a very delightful little building, octagonal on plan and domed over; the dome being of reinforced concrete and 44ft. in diameter. The interior of the chapel is faced with Bath stone up to the cornice, and plastered above: the woodwork and seating being of whitewood, left plain, as in the Shirley Hall. This chapel is the gift of Mr. Fenwick Harrison. About the building in several places children's heads are carved—as in the keystones to the master's house. These are particularly effective, and Mr. Thornely (who, we believe, is responsible for them) is to be congratulated on their design; his inspiration has come apparently from the old school. The cost of the new building at Wavertree has been about £90,000, exclusive of site. Messrs. Morrison & Sons were the general contractors. The subcontractors were:—

Heating, ventilating and fire mains, Dargue, Griffiths & Co., Ltd., Liverpool; *sanitary fittings*, D. & G. Musgrave, Horwich: *kitchen fittings*, James Cooper & Sons, Liverpool; *metal casements*, James Gibbons, Wolverhampton; *lead lights*, Gustave Hiller, Liverpool; *door springs, locks and furniture*, Quiggin Brothers, Liverpool; *terrazzo and mosaic floors*, Diespeker, Ltd., London; *marble work*, J. Stubbs & Sons, Liverpool; *laundry fittings*, Thomas Bradford & Co., Manchester; *electric wiring and fittings*, Alliance Electrical Co., Ltd., Birmingham; *ornamental fittings, and metal casements and lead lights to chapel*, George Wragge, Ltd. Manchester; *hand-power lifts*, Archibald Smith & Stevens, London; *lightning conductors*, Aird & Anderson, Liverpool; *grates and mantels*, The Well Fire Co., London; *towel rails*, &c., Brookes & Co., Ltd., Manchester; *sliding partitions*, North of England School Furnishing Co., Darlington; *classroom furniture*, Bennet Furnishing Co., Glasgow; *blinds and curtains*, Pioneer Furnishing Co., Liverpool; *stone carving*, E. O. Griffiths, Liverpool: *wood carving*, Earp, Hobbs & Miller, Manchester; *rainwater heads and wrought-iron railings*, Lockerbie & Wilkinson, Birmingham; *wrought-iron balustrades*, E. Worrall, Liverpool; *furniture*, James Parkinson, Liverpool; *laying-out ground*, L. Marr, Liverpool; *asphalt to roads and playgrounds*, Robinson, Heys & Co., Blackburn; *wrought-iron railings to playgrounds*, Thomas Brawn & Co., Birmingham; *organ in chapel*, Walker & Sons, London.



BIRD'S-EYE VIEW OF NEW BLUECOAT SCHOOL AT WAVERTREE.



COLONIAL HOUSE, WATER STREET. BRIGGS AND WOLSTENHOLME, F. B. HOBBS AND ARNOLD THORNELY, ARCHITECTS.

Colonial House.

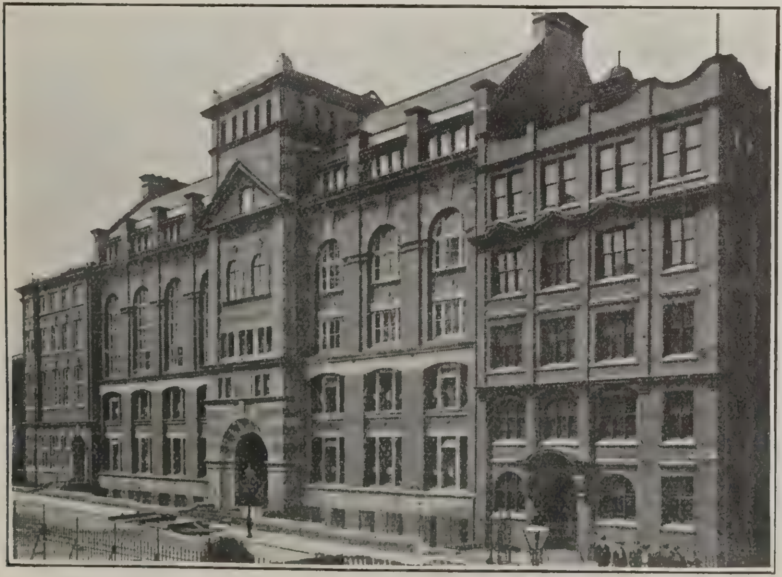
The architects of the new Bluecoat school were also the architects of Colonial House, in Water Street, the new head-offices of Messrs. Elder, Dempster & Co. The two facades of the building are carried out in Cefn stone, with red granite columns extending from first to third floors, and the base of the building also in red granite. The main office of the company on the ground floor measures 140ft. by 70ft., extending the entire width of the building; it is lighted on both sides, and also by seven domes; the furnishing throughout is of mahogany, and the floor rubber-covered. Two principal staircases give access to commodious offices on the upper floors. The heating and ventilating of the building was carried out by Messrs. Dargue, Griffiths & Co., Ltd., of Liverpool.

David Lewis Workmen's Hostel.

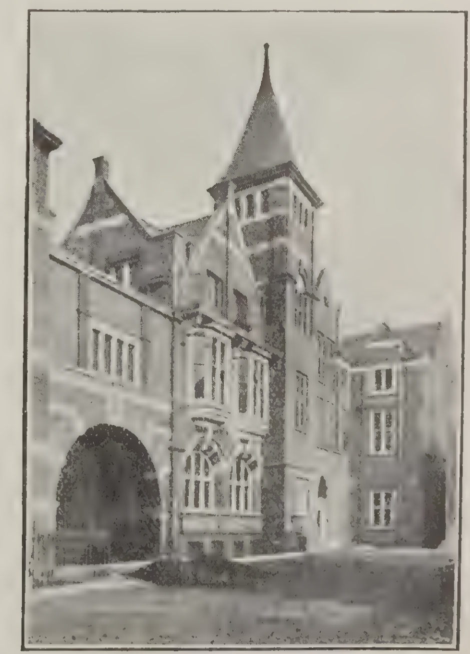
Another new building in Liverpool is the David Lewis Workmen's Hostel and Club, completed in 1904 from designs by Mr. J. Francis Doyle. This building was very fully illustrated in our issue for January 18th, 1905. It provides a workmen's home and club and public hall, very much on the lines of the Rowton Houses in London. The main frontage is to Great George Place. The building is not particularly striking architecturally, as, necessarily, the cost has imposed considerable restrictions, though the total, including site and furnishing, was £100,000. It is, nevertheless, instructive internally, being well planned. Accommodation is provided for about 800 persons.

New Laboratories at Liverpool University.

At Liverpool University several additions have recently been completed. A good block comprising zoological and electrotechnics laboratories has been erected from designs by Messrs. Willink & Thicknesse, and new medical buildings (opened in 1904) from designs by Mr. Paul Waterhouse, who has followed the style of the main buildings designed by his father, the late Mr. Alfred Waterhouse. The new medical buildings, like other blocks in the University group, are faced with local bricks and dressings of red Ruabon bricks. The George Holt Physics Laboratory is another new addition to the University. This adjoins the new Johnston Bacteriological Laboratory, with which it communicates on the first floor by a bridge. A photograph of the building (taken by Mr. William Riding, the clerk of works) is shown on this page. It is carried out in red bricks with Storeton stone dressings; the tower is open all the way down and fitted with a lift—for experimental purposes: the tower is also used to support a water tank. Messrs. Willink & Thicknesse and Prof. F. M. Simpson were the joint architects for this laboratory. The building rests on solid rock and special precautions have been taken to prevent vibration.



ZOOLOGY AND ELECTRO-TECHNICS BLOCK, LIVERPOOL UNIVERSITY. WILLINK AND THICKNESSE, ARCHITECTS.



GEORGE HOLT PHYSICS LABORATORY, LIVERPOOL UNIVERSITY. WILLINK AND THICKNESSE AND PROF. F. M. SIMPSON, JOINT ARCHITECTS.

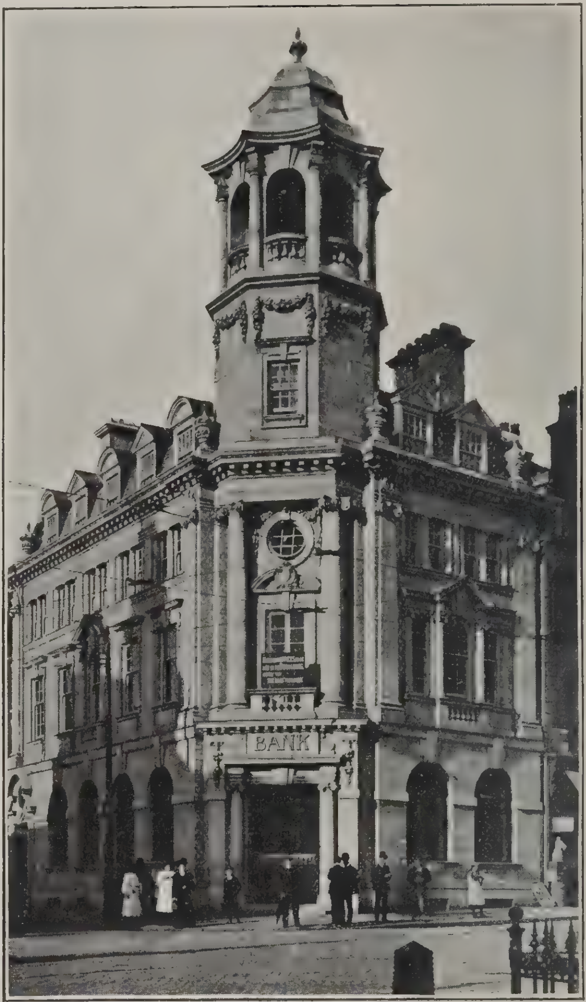
BRADSHAW AND GASS, FF.R.I.B.A., ARCHITECTS.



BANK OF LIVERPOOL, CORNER OF MOSS STREET AND PRESCOT STREET. J. FRANCIS DOYLE, F.R.I.B.A., ARCHITECT.

The New Central Hall.

In Renshaw Street a new "Central Hall" has been erected by the Wesleyan authorities, in memory of the Rev. Charles Garrett. The exterior is carried out in terra-cotta and brick, and there is about the pile a sort of theatrical effect, after the style of some of the modern German work. This is best shown by the illustration on page 173. The dome is of steel construction, and covered with terra-cotta tiles specially made by the Hathern Station Terra-Cotta Co. Within the building there is a large hall, excellently arranged for meetings, &c., capable of seating over 2,200 people, the plan being roughly that of a horse-shoe. A gallery is arranged all round and the seats in this portion of the building, as well as those on the floor of the hall, are admirably placed for hearing and getting a good view of the speaker on the platform. The seats are of the tip-up pattern and grouped together with wide passage-ways between—leading out into a crush corridor which gives access to the numerous exits. Immediately below this large hall are a lecture hall (provided with more than 700 chairs), a reception hall, a drill hall for the Boys' Brigade, and 36 other rooms for administrative purposes and young men and women's recreation rooms. The total cost of the scheme was £40,000. Messrs. Bradshaw & Gass, FF.R.I.B.A., of Bolton, were the architects, with whom was associated Mr. A. J. Hope. The clerk of works was Mr. W. A. Lowry. Messrs. William Brown & Sons, of Salford, were the general contractors. The sub-contractors were :—

Concreting, marble mosaic, roof tiling, plastering, and fibrous work, J. B. Johnson & Co., Liverpool; *plumbing and glazing*, R. Heyworth & Co., Manchester; *ornamental glazing*, Walter J. Pearce, Ltd., Manchester; *steel sashes and casements*, George Wragge, Ltd., Manchester; *heating and ventilating*, Dargue, Griffiths & Co., Ltd., Liverpool; *electric lighting*, A. Maund, Southport; *ornamental ironwork*, Thomas Powers, Manchester; *wall tiling*, Decorative Glass Co., Lancaster; *hall seatings and furnishings*, D. & H. Waddington, Bolton; *kitchen and bar fittings*, Fletcher, Russell & Co., Ltd., Warrington; *locks, door furniture, &c.*, Marley Bros., Birmingham.

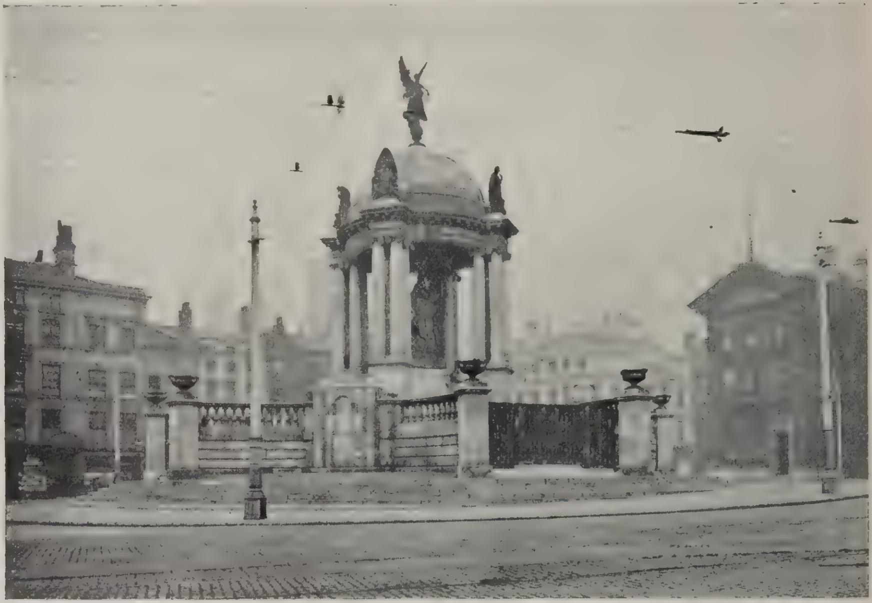
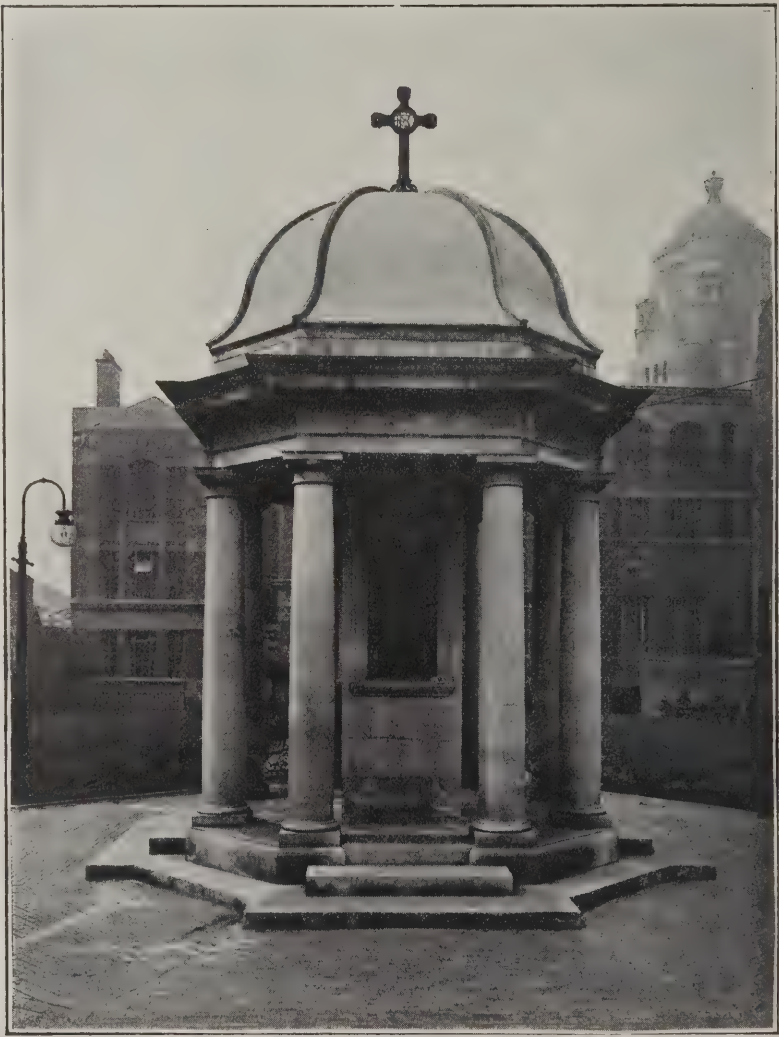
MEMORIAL TO KING'S OWN REGIMENT IN ST. JOHN'S GARDENS. W. GOSCOMBE JOHN, A.R.A., SCULPTOR.



QUEEN VICTORIA MEMORIAL, LORD STREET. PROF. F. M. SIMPSON AND WILLINK AND THICKNESSE, JOINT ARCHITECTS. C. J. ALLEN, SCULPTOP.



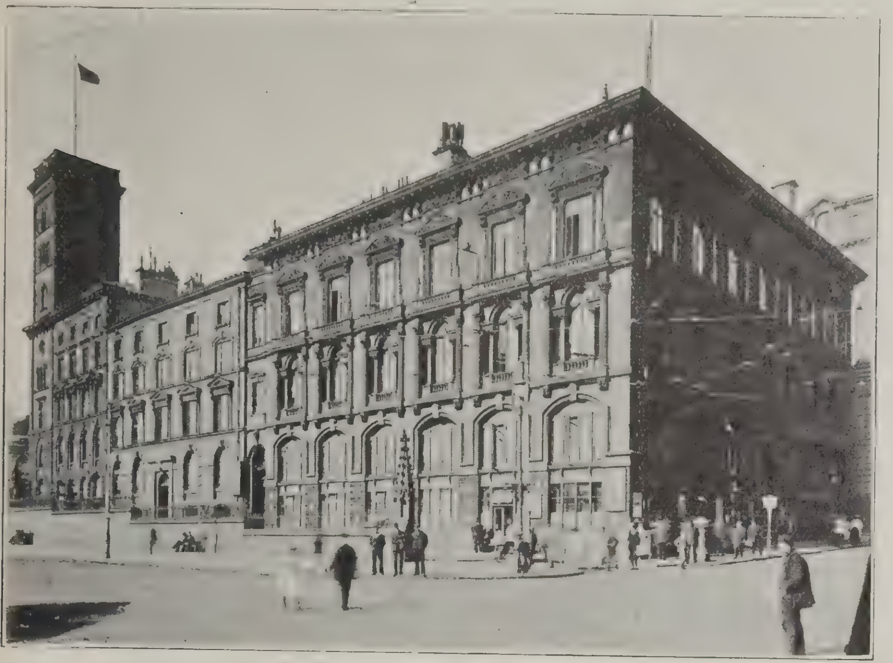
RENSHAW STREET CHAPEL MEMORIAL. THOMAS SHELMERDINE, CORPORATION ARCHITECT.

Liverpool Memorials.

At the back of the new Central Hall, and facing Mount Pleasant, there is an enclosed garden, at one end of which is a very well-designed memorial, the architect of which was Mr. Thomas Shelmerdine, of Liverpool. This is a memorial of the Renshaw Street Chapel, which formerly occupied the site. It is carried out in Portland stone, and has a bronze plaque on two of its faces. The cornice is flashed with lead and the dome covered with glazed tiles of a pale sea-green tint. Round about it is a path extending across the garden in the form of a long cross, the memorial being placed at the junction of the arms. This path is laid with 2-in. red bricks, a gutter being formed with bricks of ordinary size, and a rounded edging. The architect has done his part of the work well, and it is to be regretted that those responsible for the rest should have introduced such ordinary garden seats about the place, these being of the stock pattern with pitch-pine slats on a flat iron frame. The electric-light standard near the memorial is also a blemish, and should be replaced by something better. The entrance to the garden is furnished with beaten ironwork gates, formerly at the old chapel. They were made by Mr. E. Worrall, of Iron Gate Works, Liverpool.

Another new memorial in Liverpool, and an important one, is that to Queen Victoria at the top of Lord Street. This was completed a long time ago, but for some reason or other it was not unveiled until Thursday last, when Princess Louise performed the ceremony. The joint architects are Prof. F. M. Simpson and Messrs. Willink & Thicknesse, with whom was associated Mr. C. J. Allen as sculptor. All have worked well together, and the memorial is certainly a very good piece of work. The stone used is Portland, and the sculptor-work is in bronze. Round about the base of the dome, which is supported by sixteen Ionic columns grouped together in fours, are the figures of Justice, Peace, Charity and Wisdom, while on the top of the dome is the figure of Fame. The four pedestals in the balustrading around the memorial are at present unoccupied, but it is intended that groups representing Education, Commerce, Agriculture and Manufacture shall be set up on them. The central statue of the Queen (14ft. 6ins. high) was cast by Messrs. J. W. Singer & Co., of Frome, and the figures on the dome by Mr. A. B. Burton, of Thames Ditton, the lead vases (2ft. 8ins. diameter) having been supplied by Messrs. Thomas Elsley, Ltd. The contractors were Messrs. W. Thornton & Sons.

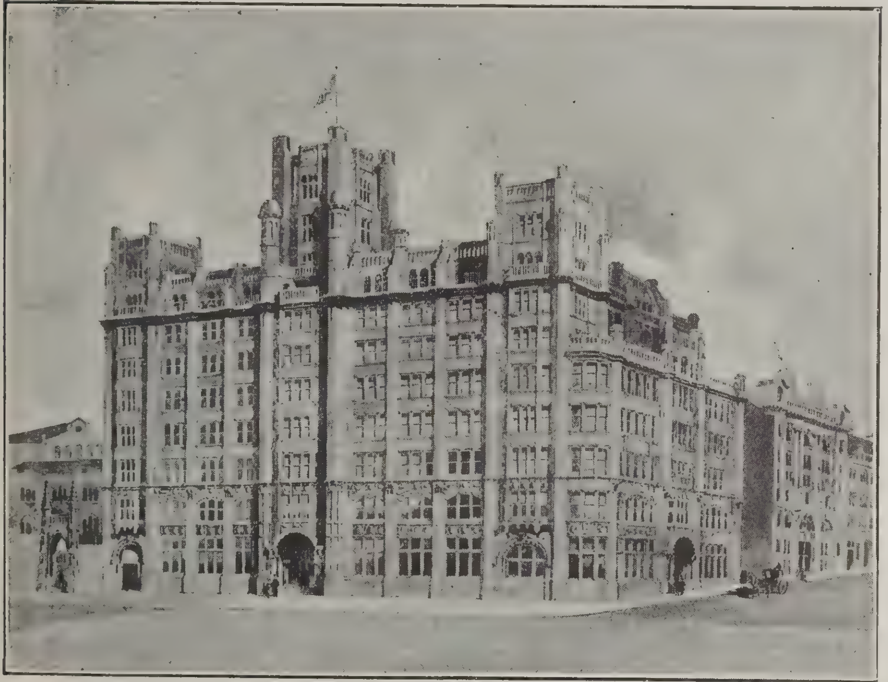
The third new memorial in Liverpool worthy of attention is that to men of the King's Own Regiment in the centre of St. John's Gardens, adjoining St. George's Hall. This is a tribute to the ability of Mr. Goscombe John, A.R.A. It comprises a central pedestal, on which is a bronze figure of Britannia, and on either side a curved parapet, with figures of soldiers at the ends, one of 1685 (in which year the regiment was enrolled) and one of 1902. In front of the pedestal are regimental trophies, and at the back is a drummer-boy. The memorial is of grey granite (supplied by Messrs. Kirkpatrick Brothers), the pedestal having been cut from a block containing 15 tons.



"TOWER BUILDINGS," WATER STREET.

New Tramway Offices.

In Hatton Garden new tramway offices are being completed from the design of Mr. Thomas Shelmerdine, the Corporation architect and surveyor. The front has three bays carried out in Hall Dale stone—which are, we think, the best portions of the building. A plan of the offices was given in our issue for December 20th, 1905. The frontage to Hatton Garden is about 184ft., and at one side is an archway leading to the car-shed. The work is being carried out by Messrs. Thornton & Sons, contractors, of Liverpool, the cost (exclusive of fittings and furniture) being put at £48,650.



BLOCK OF OFFICES TO REPLACE "TOWER BUILDINGS."
W. AUBREY THOMAS, ARCHITECT.

Prudential Building.

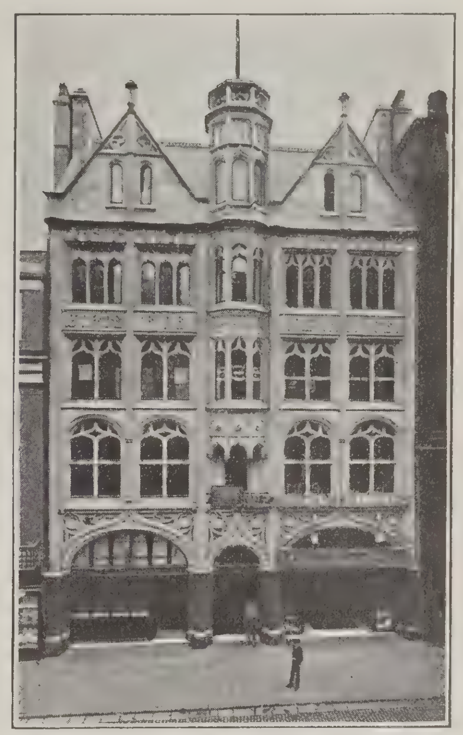
In Dale Street is a new building for the Prudential Assurance Company, by Mr. Waterhouse. The effect of this building is not, we consider, particularly happy, more especially on account of the colour of the red terra-cotta used in its construction; but the outline of the tower, which is carried up on the main front of the building, is very good, and its treatment as a combination of a tower and a chimney is somewhat novel. Inside the building, in the general office, there is a very elaborate geometrical panelled ceiling in hand-worked plaster, executed by Messrs. J. B. Johnson & Co., of Liverpool.

State Insurance Building.

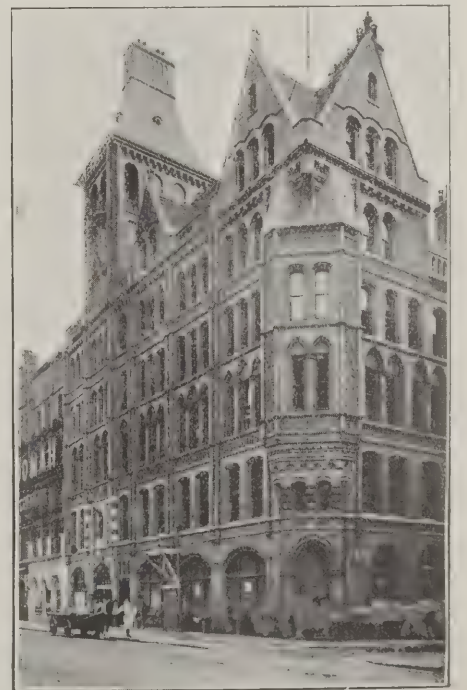
Further down the street is another new insurance building—for the State Insurance Co. The architect of this building is Mr. W. Aubrey Thomas, of Liverpool. On the ground floor is a restaurant, in which extensive onyx and marble decoration has been carried out by Messrs. John Stubbs & Sons, of Liverpool. Mr. Aubrey Thomas is also the architect of a new block of business premises in the Goree and also for a huge new block which is to be erected on the site of the existing

"Tower Buildings"

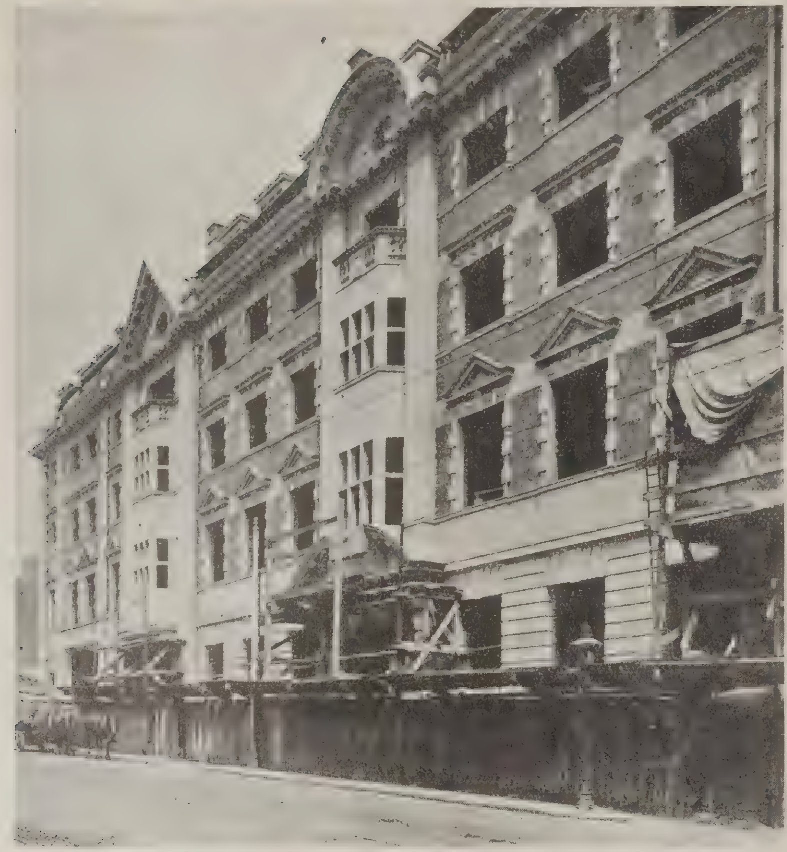
at the bottom of Water Street, extending towards St. Nicholas's Church. "Tower Buildings" was erected in 1886 and has an interest for Liverpool citizens as marking the site of the old tower which once played a rather important part in the history of Liverpool; it was demolished in the early part of the nineteenth century. The new block of offices is to be eight storeys high, with towers carried up eleven storeys, the centre portion rising to 152ft. The building, covering half-an-acre of ground, will be occupied by various steamship companies and shipowners. The work of demolishing "Tower Buildings" will be commenced in December, and it is expected the new block will be completed in 1908.



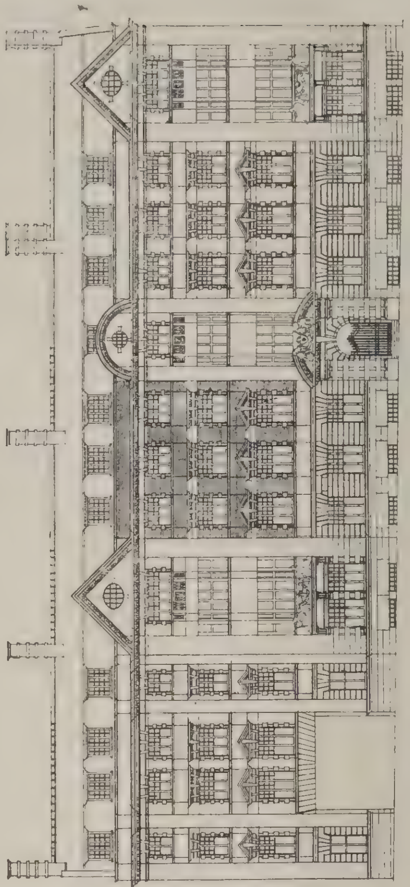
STATE INSURANCE BUILDING, DALE STREET.
W. AUBREY THOMAS, ARCHITECT.



PRUDENTIAL ASSURANCE BUILDING, DALE STREET.
A. WATERHOUSE & SON, ARCHITECTS.



NEW TRAMWAY OFFICES, HATTON GARDEN. THOMAS SHELMERDINE, CORPORATION ARCHITECT AND SURVEYOR.



ELEVATION OF NEW TRAMWAY OFFICES, HATTON GARDEN.

Messrs. Lee's Extension.

In Houghton Street an extension to Messrs. Lee's building has been erected from designs by Messrs. Matear & Simon, the architects of the new Cotton Exchange. Here, again, cast-iron work is employed, the whole frontages of the building being encased with it and painted a blue-grey colour. It is, perhaps, a question whether the casting is not in too high relief, but certainly it is very well designed, and the building is of much interest. The work has been carried out by Messrs. E. F. Blakeley & Co., of Vauxhall Ironworks, Liverpool.

Other New Liverpool Buildings.

In Leece Street a well-designed building of terra-cotta has been erected for the Road Carrying Co., Ltd., by Messrs. Haigh & Co., of Liverpool. The architect was Mr. Thomas Price, of Liverpool.

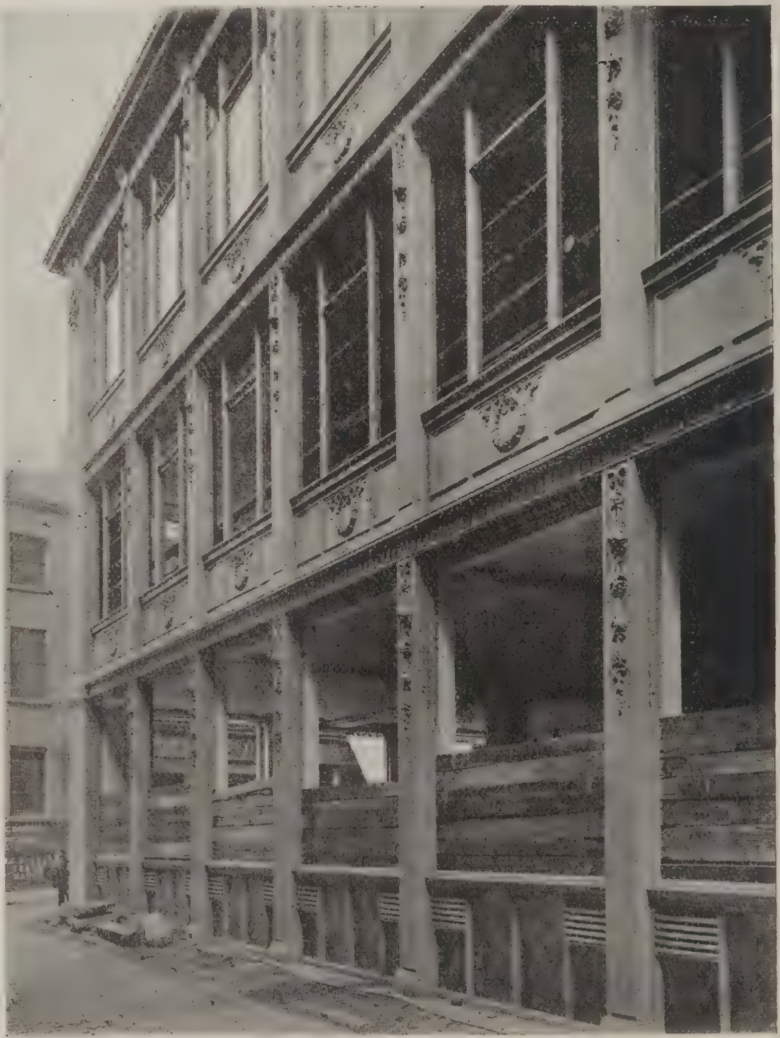
At the corner of Bold Street a branch of the North and South Wales Bank has been erected from designs by Mr. J. Francis Doyle, and another branch of the same bank in Lodge Lane from designs by Messrs. Woolfall & Eccles. Both buildings were illustrated in our issue for December 28th, 1904.

Another new bank is that for the Bank of Liverpool at the corner of Moss Street and Prescot Street. The architect was Mr. J. Francis Doyle.

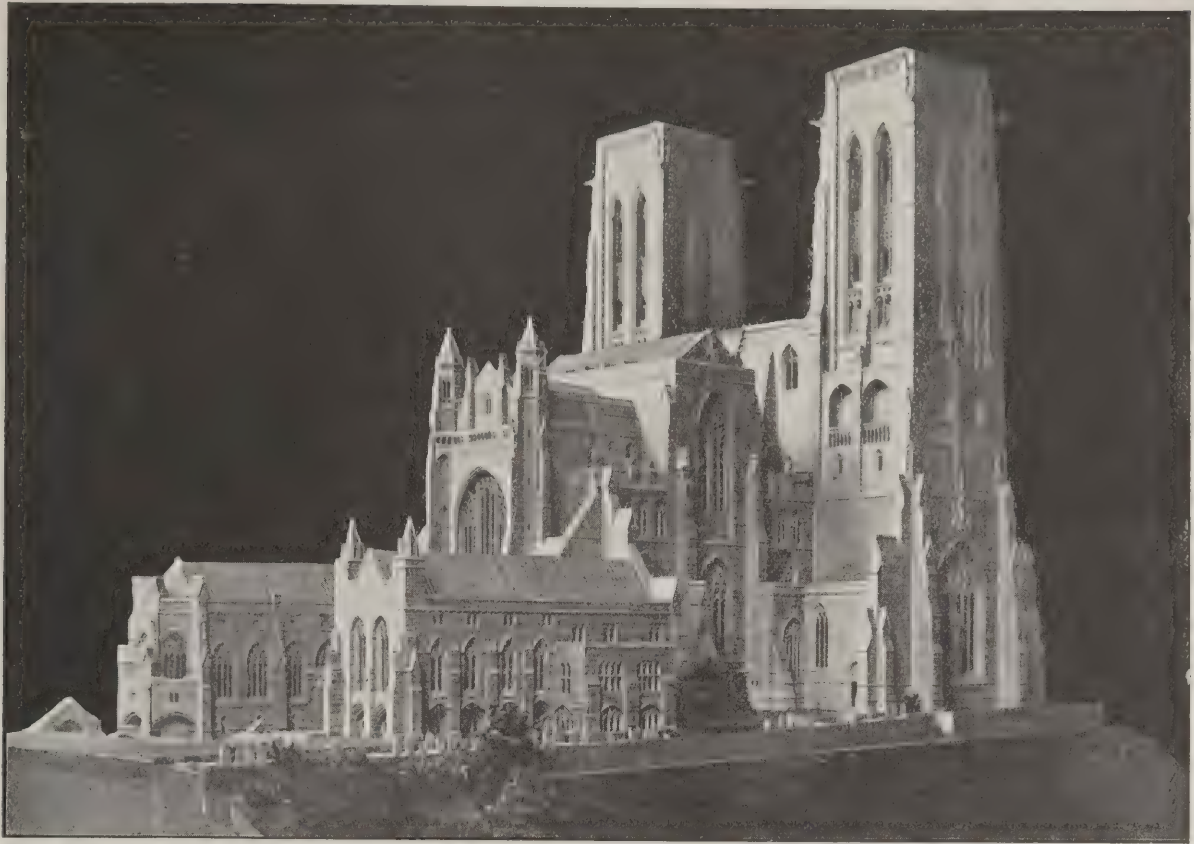
In Dale Street a new Kardomah Café has been completed. Tiles are here extensively used, the work having been carried out by Messrs. Craven, Dunnill & Co., Ltd.

A new little building of interest is that in Renshaw Street for Messrs. Quiggin Brothers, ironmongers. The architect was Mr. Henry Hartley, F.R.I.B.A., of Liverpool.

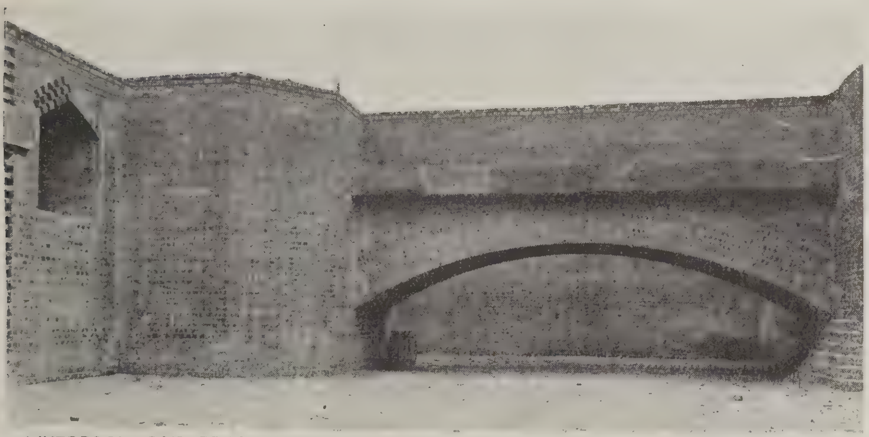
New premises in Fraser Street, off London Road, for the 8th (Scottish) Volunteer Battalion of the King's (Liverpool Regiment) have been erected from designs by Messrs. Woolfall & Eccles.



EXTENSION TO LEE'S PREMISES, HOUGHTON STREET. (Cast-Iron Work.) MATEAR & SIMON, FF.R.I.B.A., ARCHITECTS.



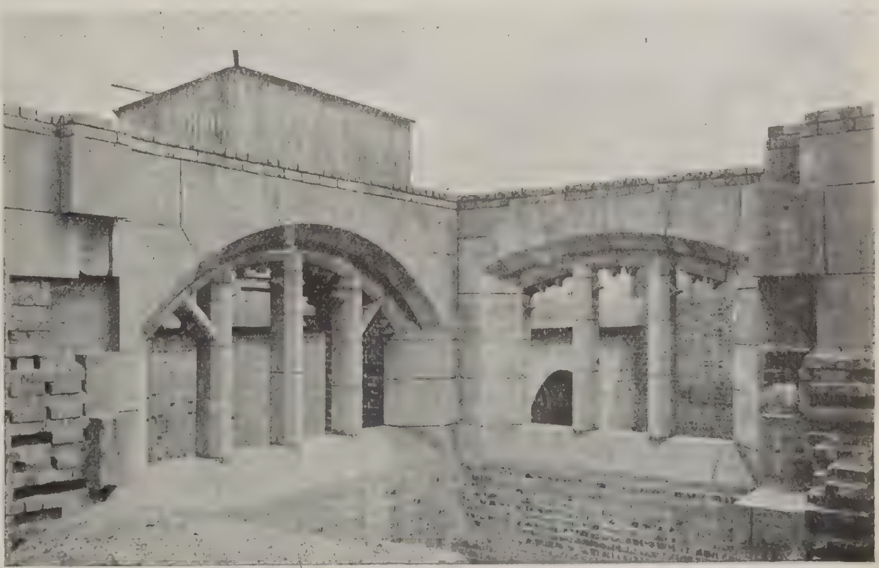
MODEL OF THE PORTION OF LIVERPOOL CATHEDRAL FIRST TO BE ERECTED.



LIVERPOOL CATHEDRAL: ARCH BETWEEN PIERS OF SOUTH TRANSEPT TOWER. SPANNING ORGAN BLOWING CHAMBER AND CARRYING PIERS BETWEEN TOWER AND AISLE.

Liverpool Cathedral.

The new cathedral at Liverpool, of course, is a most important building; but at the present moment so little of it appears above ground that there is no necessity for any detailed description of the building, to which so much attention has been given during the last two or three years. It may be mentioned, however, that the portion of the cathedral now in process of erection comprises the transepts with their twin towers, the choir, the chapter-house, vestries and Lady chapel; the nave will be built later. The first portion is estimated to cost £240,000, and the choir will not be ready for service for ten or twelve years. The Lady chapel is to be completed in four years. There is some very heavy foundation work to be seen on the site, and it is interesting to note on two completed windows lighting into an area how the cusps are worked direct on the soffit. The two twin towers are to be 260ft. high. The foundations comprise four piers, each 32ft. square at the base and tapering to 16ft. square at the top. The contractors, Messrs. Morrison & Sons, of Wavertree, are now getting into full swing. They have erected a setting-out shed 50ft. square and three pairs of saws, electrical driven, for the stonework, a 6-ton electric crane running in front to feed the saws. An electric crane running down the centre of the choir has also been erected, and four derricks (electric) are in position. A very interesting model of the portion of the building first to be completed is to be seen in the Walker Art Gallery at Liverpool. It was made by Mr. Lawrence A. Turner. For the accompanying illustration of this model we are indebted to the editor of *The West Lancashire Masonic Record.*



LIVERPOOL CATHEDRAL: WINDOWS IN AREA.
G. GILBERT SCOTT AND G. F. BODLEY, R.A., JOINT ARCHITECTS.

Notes and News

The A. A. Brown Book has just been issued.

The New Municipal Buildings at Cardiff will be opened by the Marquis of Bute on October 29th.

Mr. R. Phenè Spiers is retiring from the mastership of the Architectural School at the Royal Academy.

Mr. W. D. Caroe was sworn into the office of Master of the Worshipful Company of Plumbers on Saturday.

The Restoration of Culross Abbey is now nearing completion, and it is expected that the building will be ready for occupation next month.

Change of Address.—Mr. F. C. Moscrop-Young, architect, has moved from Waldorf Chambers, Aldwych, to 12, Buckingham Street, Strand, W.C.

Mr. Thomas Ross, of Messrs. MacGibbon & Ross, architects, Edinburgh, has been named by the late Earl of Leven and Melville in his will as the architect to have charge of the work of restoring the chapel attached to Holyrood Palace, Edinburgh. The Earl has left £40,000 for this purpose, conditional on the Government authorities employing Mr. Ross as architect.

Herculaneum, the ancient Roman city which was buried 1,800 years ago by an eruption of Vesuvius, is to be excavated by the united action of England, Germany, France, Italy, the United States, and other countries; Prof. Waldstein, of Cambridge, being the prime mover in the scheme. The town of Resina is to be bought up and demolished, and a thickness of 80ft. of earth removed.

R.I.B.A. Autumn Examinations.—The Preliminary Examination of the Royal Institute of British Architects will be held on November 5th and 6th, the Intermediate on November 5th, 6th, 8th and 9th, the Final and Special on November 15th, 16th, 17th, 19th, 20th, 22nd and 23rd; and the examinations qualifying for District Surveyor in London and Building Surveyor under Local Authorities on October 18th and 19th.

Junior Institution of Engineers.—About 100 members of this institution recently visited the Northfleet works of the Associated Portland Cement Manufacturers (1900), Ltd.. They were shown round by Mr. H. K. G. Bamber, one of the managing directors, and by members of the staff. All the processes in the manufacture of Portland cement by the most modern methods were seen in operation. Electrical power is largely employed at the works, and considerable extensions are being made.

The New Central Fire Station at Manchester was opened on Thursday last by the Lord Mayor. The total cost, including site, has been about £145,000. Messrs. Willoughby, Woodhouse & Langham were the architects. The building is carried out in vitreous terra-cotta and pressed bricks. The contractors were Messrs. J. Gerrard & Sons, Ltd. The engine-house has space for seven vehicles, and stalls for 14 horses, the exits being into Fairfield Street. Residences are provided for the officers, and there are thirty-five tenements for firemen.

The Great Wheel to be taken down.—On Monday the work of taking down the Great Wheel at Earl's Court was commenced by Mr. Walter Basset, who twelve years ago erected the wheel after his own designs at a cost of £6,000, Mr. C. F. Hitchens, civil engineer, having constructed it. The wheel rests on a bed of concrete weighing 1,100 tons. The axle weighs 53 tons and is 7ft. in diameter. It was originally intended to run lifts up to the axle to allow people to walk through it, but this part of the scheme was never carried out. The weight of the columns supporting the wheel is about 500 tons, while the wheel itself weighs about 600 tons. The disappearance of the wheel will leave only three great wheels in the world—one at Blackpool, one in Paris, and one in Vienna.

Notes on Competitions

Free Library at Hither Green.

From twelve designs for the new library to be built at Hither Green, at a cost of £4,500, the design of Mr. Hopton, of Catford, has been selected. The competition was limited to local architects.

For Canadian Architects.

A competition is being held among Canadian architects for new departmental buildings to be erected at Ottawa by the Government. There are four large premiums. The competition closes on February 15th next.

Cemetery and Caretaker's House, Stewarton.

This competition has been decided in favour of Messrs. J. and J. Armour, of Irvine, the second premium being awarded to Mr. J. Sturrock, junr., of Kilmarnock, and the third premium to Messrs. Cowan & Knox, of Glasgow.

"Architectural Review" Alphabet Competition.

The following designs in this competition were received up to and including the closing day, Monday, October 1st:—Abednego Jones, Acanthus, Alexis, Alpha I., Alpha 2, Alphomega, Arrow, Birdie, Boz (two designs), Bricks, Capstone, Classic, Crockett, Crusader, Cygnet, Delf, Einna, Eu Esperanza, Gargoyle, Grafton, Jacko (three designs), Jacobus, Kingfisher, Light, Lituus, Memory, Michael, Nimrod, Ornament, Pictorial, Pulido, Q.E.D., Red Ink, Scarab, Sol, Stan, Suggestion, T^2, Tau, Vendura, Visigoth, Wadham Whim, Wild Briony.

List of Competitions Open.

DATE OF DELIVERY	COMPETITION.
Oct. 20	SEWERAGE SCHEME FOR HIGHBRIDGE, Somerset. Premium £20. Particulars from W. C. Shier, Surveyor to the U.D.C., Highbridge.
Oct. 22	SCHOOL AT GAYWOOD, King's Lynn. Particulars from Secretary, County Education Office, 57, London Street, Norwich.
Oct. 31	BOURSE AT CAIRO.—Premiums of £E250 and £E100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Dec. 14	FOUNDLING HOSPITAL, MONTEVIDEO.—Four selected designs in preliminary competition to be awarded £212 each; first premium of £742 in final competition. Particulars from Consulate-General for Uruguay, 5 & 6, Clement's Inn, London, W.C.
No date	LIBRARY AT FRIBOURG, Switzerland (International competition.) Particulars from "La Direction des Travaux Publics," Fribourg.

Correspondence.

Girls' Secondary School, Aigburth Vale, Liverpool.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The cloakroom accommodation in the above competition, which Mr. Sidney F. Harris commented on in your issue for last week, was no doubt an important point to the competitors who provided for 100 juniors and 300 seniors, while the premiated designs compromised accommodation for 200 in each cloakroom. On referring to the conditions, and also to the replies to questions, I find that these details, with many equally important, besides the general arrangement, were left "to the discretion of competitors." The conditions throughout were evidently meant to be advisory, and suggestive of what was wanted by the Education Committee. The position of the building on the site was definite, and it lay with the competitors to interpret what other points were worthy of serious consideration, or were merely a question of detail which the committee thought necessary to include in the particulars. It was a fair trial to see who could produce the best solution of a difficult problem.

All the competitors had the same difficulties, but the architect with a varied competition experience is nearly always able to get at the gist of the matter quickly, and can interpret in a broad way what the committee want, and he usually ends with a scheme which is a compromise between the printed requirements and what his professional training has taught him is a good workable, presentable and impressive idea to the eye of the assessor. For, when all is said and done, the committee do not adjudicate as a rule, but the assessor. He is the one to consider, and he generally favours the architectural side more than the whimsical fads of committees. In the case of this school, it was known that the assessor was an authority on planning, and common-sense taught the few to go strong on a well-arranged and balanced plan. No assessor of any standing would reject a good scheme simply because it departed from a few details of the conditions, or from the natural reading of the particulars. There has been no competition which the competitors have slavishly followed or shown on the plans every detail required, as the ideal plan has yet to be discovered that will suit committee, assessor, and competitors. In a nutshell, the committee in the majority of cases do not know in detail what they want—they leave that for the architects to supply, or they would not rush it into public competition. In this case the competitors, almost to a man, are satisfied with the awards of the assessor.—Yours truly,

Liverpool. W. EDWARDES SPROAT.

Obituary.

Mr. Charles Long, of the firm of Messrs. Wylson & Long, theatre architects, London, died recently,

The late Mr. E. E. Scrivener, of the firm of R. Scrivener & Sons, architects, Shelton, left estate which has been valued at £13,191 nett.

Mr. J. A. Webster, head of the firm of Webster and Cannon, contractors and builders, of Aylesbury, died on Monday, last week. His firm has carried out some large Government contracts.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Oct. 4. Manchester.—*Erection of Telegraph Office, &c.*, at Ancoats Goods Depot, Manchester, for the Directors of the Midland Railway Co. Plans and specifications may be seen, quantities and particulars obtained on application at the Engineer's Office, Derby Station. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on Oct. 4.

Oct. 4. Lyminge.—*Erection of a chimney shaft* and alterations to a boiler house at the workhouse, Lyminge. Also separate tender for taking out two boilers and fixing two other boilers and an economiser. Plans and specifications can be seen of R. Lonergan, clerk, 41, Cheriton Place, Folkestone, between 10 and 5 o'clock, except on Saturday, when they can be seen between 10 and 1 p.m. Tenders to be delivered to the clerk before Oct. 4.

Oct. 4. Chester-le-Street.—*Excavating, concrete foundations, brickwork, &c.*, required in extending the arch of West Pelton Road Bridge, Grange Villa, near Chester-le-Street. Span 13ft. 6in., length 50ft. Plans and specifications may be seen and form of tender and schedule of quantities obtained at the office of G. W. Ayton, highway surveyor, Chester-le-Street, any day between the hours of 9 a.m. and 5 p.m. Tenders, endorsed "Tender for Bridge Extension," to be sent to the Surveyor not later than the first post on Oct. 4.

Oct. 4. Levenshulme.—*Erection and completion of the new technical school* proposed to be erected at the rear of the Chapel Street Council School, Chapel Street, Levenshulme. Specifications, bills of quantities and further particulars may be obtained on application to H. Littler, architect, 16, Ribblesdale Place, Preston, on payment of £3 3s. Tenders, endorsed "Tender for New Technical School," to be sent to J. O. Hardicker, clerk, Northern Assurance Buildings, Albert Square, Manchester, on or before Oct. 4.

Oct. 6. Chelmsford.—*Erection of an applied art room* at the New Library Buildings, Market Road, Chelmsford, for the committee. Persons desirous of tendering can inspect the plans and specification at the offices of Chancellor & Son, Duke Street, Chelmsford, to whom tenders are to be sent on or before 10 a.m. on Oct. 6.

Oct. 6. Cwm.—*Erection of new Baptist Chapel*, Cwm. Drawings and specifications may be seen at the office of N. G. Lewis, F.I.A.S., architect and surveyor, Oak Street, Abertillery. Tenders, endorsed "New Chapel, Cwm," to be in the hands of the Secretary, H. Howells, 9, Railway View, Cwm, Mon., by noon, Oct. 6.

Oct. 6. Walton-on-Thames.—*Works of repairs and painting, &c.*, at the Weylands Sewage Works, Molesey Road, Walton-on-Thames, for the U.D.C. The specification may be seen, and forms of tender obtained on application at the Engineer and Surveyor's Office, Walton-on-Thames, during the usual Office hours. Tenders, sealed and endorsed "Tender for Painting," must be delivered to R. Wilds, not later than 12 a.m. on Oct. 9.

Oct. 6. East Meon.—*Two cottage dwelling houses to be erected at East Meon* for the Trustees of the Forbes Almshouses, East Meon, Petersfield. Oct. 8. Sevenoaks.—*Supply of 800 tons (more or less) of granite or quartzite*, broken to a gauge of 2ins. for the U.D.C. Forms of tender (on which alone tenders must be made), with specification and conditions, may be obtained of S. Towlson, A.M.I.C.E., surveyor to the Council, Argyle Road, Sevenoaks, to whom a sample of the granite or quartzite tendered for must be delivered, free of cost, to the Council not later than Oct. 8. Sealed tenders, addressed to H. J. Thompson, clerk to the Council, U.D.C. Offices, Sevenoaks, endorsed "Tender for Granite" or "Quartzite," to be delivered not later than Oct. 8.

Oct. 8. Salisbury.—*Reconstruction and widening of St. Mark's Avenue*, the construction of sewers, surface-water drains, manholes, gullies, and other works incidental thereto for and on behalf of the Ecclesiastical Commissioners for England and their surveyors, Messrs. Clutton, 5, Great College Street, Westminster Abbey, London, S.W. Plans, specification, and conditions of contract, prepared by Lemon & Blizard, MM.Inst.C.E., engineers for the works, may be inspected at their Salisbury office, and copies of bills of quantities obtained on depositing the sum of £2 2s. Sealed tenders to be sent to the engineers' office, 29, Market Place, Salisbury, on or before Oct. 8, before 5 p.m.

Oct. 8. Kibworth Beauchamp.—*Construction and making-up of the following streets* in the parish of Kibworth Beauchamp:—Gladstone Street, Dover Street, Buller Street, Kimberley Street, White Street, and Rosebury Avenue, for the Market Harborough R.D.C. Plans may be seen at the offices of the council, and at the offices of the engineers, Everard, Son, & Pick, 6, Millstone Lane, Leicester, from whom quantities and form of tender may be obtained upon payment of £2 2s. Sealed tenders to be sent to the Clerk to the Council, Market Harborough, not later than 10 o'clock in the forenoon of Oct. 8, endorsed "Tender for Kibworth Roads." The contractor must provide sureties for the due performance of the contract.

Oct. 8. Petworth.—*Steam rolling and scarifying the roads* within the district which comprises the parishes of Barlavington, Bignor, Burton, Bury, Coates, Duncton, Egdean. Fittleworth, Kirdford, Northchapel, Petworth, Stopham, Sutton and Wisborough Green, for the R.D.C. The scarifying to be done at the rate of ¾d. per sq. yd. The Council will require one roller with scarifier and one without scarifier to be provided. It is estimated that the roller with scarifier may have to work in the aggregate for 60 days, and that without a scarifier forty days, but the council do not bind themselves to any exact number of days. Further particulars may be obtained on application to E. H. Staffurth, clerk to the Council, Petworth. Tenders for each roller, separately marked on the outside "Tender for Steam Rolling," to be sent to the Clerk on or before Oct. 8.

Oct. 8. Broadstairs.—1. *Supplying and delivering 1,400 feet run of 6-in. by 12-in. granite kerbing* (straight), 50 feet ditto (circular), and 650 feet run of 12-in. by 6-in. granite channel. 2. Supplying and delivering 250 tons of broken basalt or granite macadam, 1½-in. gauge. 3. 1,250 cubic yards of broken pit flints for the Broadstairs and St. Peter's U.D.C. Persons tendering must forward a sample truck of flints, carriage paid, to Broadstairs Railway Station, and such sample of flints will be paid for at the rate of the accepted tender. Those tendering for broken granite or basalt must forward a small sample of the material with their tender. Sealed tenders, endorsed with the names of the materials tendered for, must be delivered not later than noon on Oct. 8. No tender will be considered unless it be sent in on the prescribed form, which can be obtained from H. Hurd, C.E., town surveyor, Council Offices, Broadstairs.

Oct. 9. London, S.W.—*Supply and delivery of fine binding gravel* at parks, gardens, and open spaces under the control of the London C.C. Persons desiring to submit tenders may obtain the specification, schedule of quantities, form of tender, and other particulars at the Parks Department, 11, Regent Street, S.W. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Gravel, Parks and Open Spaces." No tenders will be received after 10 a.m. on Oct. 9th.

Oct. 9. London, S.W.—*Widening of the Lower Richmond Road* at the southern approach to Putney Bridge, in the Metropolitan Borough of Wandsworth. These comprise the demolition of the existing parapet wall and end walls of arches on the riverside of the footway and the removal of a portion of the present roadway, &c., surfaces; the construction of a new retaining wall and parapet; the extension of the brick arches beneath the roadway; and paving and other works. Persons desiring to submit tenders may obtain the drawings, specifications, bills of quantities form of tender, and other particulars upon application to M. Fitzmaurice, C.M.G., chief engineer, County Hall, Spring Gardens, S.W., upon payment to the Cashier of the Council of the sum of £3. Full particulars may be obtained on application at the County Hall previously to the payment of the fee for the specification, &c. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Alterations to Putney Bridge Southern Approach" No tender will be received after 10 o'clock a.m.. on Oct. 9.

Oct. 10. Guildford.—*Supply and delivery of the following road materials*:—4 0 tons, or thereabout, of Blue Guernsey Granite broken to pass a 2-inch gauge. 600 tons, or thereabout of blue Guernsey granite to pass a 1½-inch gauge. Forms of tender and conditions of contract may be obtained on application to C. G. Mason, M.I.C.E., the borough engineer and surveyor, at his office, Tunsgate, Guildford. No tender will be considered except upon the prescribed form. Tenders, endorsed "Tender for Broken Granite" are to be sent to F. S. Miller, town clerk, Town Clerk's Office, Bridge Street, Guildford, on or before Oct. 10, not later than 12 noon.

Oct. 11. Southend-on-Sea.—*Making-up of the following streets*:—Ambleside Drive (part of), Maldon Road, Station Avenue, Leonard Road, Cossington Road (part of), Elderton Road (part of), Cranley Road, Cranley Avenue (part of), Beach Road (part of). Plans, sections, and specifications may be seen and bills of quantities and forms of tender obtained on deposit of cheque for £1 1s. in respect of each street, upon application to E. J. Elford, M.I.M.E., borough surveyor. No tender will be considered unless made on the prescribed form, and there must be a separate tender for each street. Sealed tenders, endorsed with the name of the street and marked "Tender for Private Street Works," to be delivered at the office of W. H. Snow, town clerk, Town Clerk's Office, Southend-on-Sea, before 5 p.m. on Oct. 11.

Oct. 15. East Grinstead.—*Construction of a new dustless road* at East Grinstead, Sussex, for the owners of Marriott Estate, according to plans and specifications to be seen at 65, Lincoln's Inn Fields, London, W.C., any week day (except Saturdays) between the hours of 11 a.m. and 4 p.m. Copies of the specification and form of tender can be obtained on payment of a fee of £1 1s. Tenders should be addressed to Hasties, 65, Lincoln's Inn Fields, London, W.C., and should be delivered not later than 4 p.m. on Oct. 15,

Oct. 18. London, S.E.—*A cargo of about 350 tons Channel Island granite spalls* for stonebreaking, for the Grove Park Workhouse, Lee, S.E. Forms of tender can be obtained on application at the Clerk's Office, Woolwich Road, Greenwich, and must be delivered by noon on Oct. 18. on which date they will be opened at a meeting of the guardians.

No Date. Stonebridge.—*Providing and laying 400 yards. or thereabouts, of 2-inch artificial stone paving*, for the U.D.C. Particulars may be obtained on application to F. Woodward, surveyor, Town Hall, Stourbridge.

Nov. 8. Cape Town.—*Material and labour required for laying asphalt paving* in the carriage ways of Long Street and Darling Street (between Plein Street and Castle Bridge), and for the maintenance of the same in a perfect state of repair for a period of twelve months thereafter. The total area to be paved with asphalt is approximately 34,000 superficial yards, including the tramway tracks, and it is the intention of the Council to select several kinds of asphalt for testing purposes. The concrete foundations will be provided by the Council. Specification may be seen and forms of tender and full information obtained upon application at the Offices of Davis & Soper, Agents of the Corporation of the City of Cape Town, 54, St. Mary Axe, London, E.C. Tenders, under seal and endorsed "Tender for Asphalt Paving," must be delivered to Davis & Soper, not later than 4 o'clock p.m. on Nov. 8th, and samples not later than 4 o'clock p.m. on Nov. 1. No tender will be considered unless submitted on the official form

SANITARY.

Oct. 6. Skipton.—*Construction of detritus tanks, sedimentation tanks, continuous filters, the laying-out of about 20 acres of land, the construction of a storm-water bed and main*, and other works in connection with the Skipton U.D.C. sewage disposal works The drawings may be seen and a copy of the specification, schedule of quantities, conditions of contract, and form of tender obtained on application to J. Mallinson, Council's engineer, Town Hall, Skipton, on payment of £2 2s. Sealed tenders, in envelopes to be supplied, are to be delivered to R. Wilson, clerk to the Council. not later than Oct. 6.

Oct 6. Lichfield.—The Sanitary Committee of the City Council are prepared to receive separate tenders for the following works:—(*a*) Excavating and forming two filter beds, making and erecting wood carrier, on brick piers; alteration of humus tanks, including brickwork, cast-iron pipes and valves, building sludge chamber. with elevator and other appurtenant work in connection therewith, at the sewage works, Curborough, Lichfield. (*b*) Providing and fixing over the said filter-beds two complete sets of galvanized iron tubing to form fixed spray distributors. (*c*) Erection of workmen's houses, near to the above-mentioned works, at Curborough, Lichfield. Plans of the above-mentioned works may be seen, specifications, forms of tenders, and other particulars obtained on application to E. Brooke, city surveyor, Lichfield. Sealed tenders, separately endorsed, to be sent in to Herbert Russell, town clerk Lichfield on or before Oct. 6.

Oct. 8. Barnes.—*Supply of about 2,500ft. run of 30-in. concrete tubes*, and 600ft. run of 24-in. concrete tubes, delivered at Barnes or Mortlake, for the Barnes U.D.C. Specification and form of tender may be obtained of G. B Tomes, engineer and surveyor, Council House, High Street, Mortlake, S.W. Tenders, endorsed "Tender for Concrete Tubes," to be sent in not later than 12 o'clock noon on Oct. 8.

The Architect *v.* the Jobbing Builder. WE are accustomed to accept what is the customary system as inevitable, without troubling to think about it, but if we chose to compare our everyday practice in many directions with the practice of other countries we should often find that we might very materially modify our methods with advantage. Other countries are as old as ours—in fact, some are older; so that when we find a different system in vogue on the Continent we should always be prepared to enquire into it more closely than some novelties hailing from the other side of the Atlantic. Newer countries are able to develop methods of dealing with new problems, but the older countries offer suggestions in regard to the smaller things we count as commonplaces. This applies particularly to the lesser matters of the building trades, such as our system of dealing with small repairs and alterations, redecoration of houses, &c. An English householder is ever ready to call in the aid of the small master-man who goes under the generic name of the jobbing builder. In France, however—at any rate, in the greater part of that country—the class of jobbing builder is non-existent. Quite a different system prevails in dealing with things which come under his wing here, and apparently many of the anomalies which exist are removed under the French system. There a householder calls in the assistance of an architect, instead of running to some small tradesman, who has usually risen from being a journeyman. The architect is expected to engage the tradesmen, to instruct them to meet the wishes of his client, and to supervise their work; and, finally, he has to see that the work is well done and that his client is not overcharged. As a class, the jobbing builder is not a particularly intelligent person. The very fact of his having risen from the ranks means that he has not passed any examinations and has had no education in any trade but his own. His ideas of taste, and his methods of dealing with constructional matters, are wonderful and strange. If it were not for the craftsman he employs he would often never pull through a difficult job at all, and his experiments and inexperience are both alike paid for by the public. We all know how the comic papers make a butt of these small tradesmen for their overcharges, and, although a good deal is exaggerated, there is much truth in this general opinion. The encouragement which the public gives to the furtherance of such a system is primarily due to the system being accepted as inevitable, even as a necessary evil which has to be put up with, but we are rather inclined to think that the jobbing builder receives a good deal of work from persons who like to have their own way and superintend the decoration of their homes themselves—persons who feel that if they went to an architect they could not get him to carry out their fads and fancies; indeed, he might take the matter too much out of their hands, and perhaps lead them into an expenditure beyond what they desire. The jobbing builder, of course, panders to the public. It does not matter to him what experiments are made by his clients. His men are paid for by time, and, if a job takes longer than it should, that is all to his advantage. From every point of view, the public would find it far better and cheaper to go more to the architect; and, although architects here (not being accustomed to undertake such duties as their brethren do in France) are without any recognised basis of charges, it would be an easy matter for this to be settled. Instead of decorations and repairs being carried out by inexperienced and ignorant men, many of whom can scarcely read or write, the work would be executed in the best and speediest manner when placed in the hands of a person professionally trained and educated to deal with such matters. Of course, we cannot expect the medieval system of Japan to have much weight in appeal to the public; but it is a point of interest to know that in that country the public go to an architect, who engages the workmen to build a home, and ever afterwards, in his lifetime, the occupants call in his assistance when they desire any alterations, repairs or decorations. Undoubtedly, there are many men engaged in jobbing works who are educated, who have taste and ability, and who serve the best interests of the public. Alteration in the existing system would not affect them. But, in any case, the change will be gradual, if it comes at all. Even if it did come, the architect would need firms, as well as craftsmen, to co-operate with him. We only emphasise the crudities of the present system in England, and point a way of modification which might result in removing many anomalies.

Colouring Brickwork. IT is a common practice when brickwork gets dirty, after a few years' exposure to the sooty atmosphere of towns, to brighten it up by applying colour washes and repointing. This is pernicious, for not only does it never produce the desired effect of new brickwork, but it looks what it is —"painty"—and after a year or so its appearance is worse than ever. Sometimes yellow stocks, or white Suffolks and Burham bricks are actually transformed into red bricks. The pointing, too, is ludicrous; the joints are filled up flush, the colour-wash applied over all, and the pointing lined in according to the fancy of the workman, often somewhat out of the horizontal and with imperfect perpends, and finally with the most weird conception of bonding. The suburban villa is bad enough without this sham brickwork. If it must be cleaned up, why not spend a little more time and trouble in rubbing down the surface and showing the honest substance of the real bricks?

THE ARCHITECTURAL ASSOCIATION.

Mr. Balfour's Presidential Address.

The opening meeting of the session of the Architectural Association was held at Tufton Street, Westminster, on Friday evening last, when Mr. R. S. Balfour, F.R.I.B.A., the new president, delivered his inaugural address. For the most part it dealt with the internal affairs of the Association. After the orthodox prologue of thanks for the past, apologies for the present, and hopes for the future, Mr. Balfour went on to speak of the officers of the Association—the wonderfully successful presidency of Mr. Guy Dawber, the handing over of the treasurer's keys from Mr. Francis Hooper to Mr. Henry T. Hare, changes on the council, the assiduity of their secretary, Mr. Driver, and the services rendered to the Association by Mr. W. G. B. Lewis; instructors, too, were not forgotten, for the president had an eloquent tribute for Mr. Pomeroy (who had been obliged to relinquish his position as Instructor in Modelling on account of the increased calls on his time since his election to the Royal Academy), and there was also a warm congratulation for Mr. de Gruchy on his recent appointment to the newly-constituted architectural schools at the Academy.

Leaving the *personæ grata,* Mr. Balfour turned to the Association itself and its progress. When their jubilee was celebrated in 1897 they had a membership of 1,111 and subscription receipts amounting to £841; to-day they had more than 1,700 members, while the subscriptions last year were £1,406, which was most satisfactory. They still had their building debt, however, despite the astounding reception meted out at their last annual dinner to that portentous, though quite unofficial toast,

"Death to the Building Debt."

The means by which they had hitherto sought to bring about his complete annihilation had almost come to an end, and latterly they had only been able to administer such homœpathic doses as those little silver pilules of the "Purple Patch" Shilling Fund—drugs quite inadequate for the purpose in hand. Mr. Balfour agreed that there might be few occasions when murder was legitimate, even praiseworthy, "but, gentlemen, I want you to be my accomplices in ridding ourselves from the fetters of this tyrant. . . . I wonder how many of you are aware that if each member of the A.A. who has not already done so contributed only 15s., this £767 debt of ours would to-morrow morning be an incident in our bygone history. It seems to me incredible that in a society like this . . . we should have to deplore the apathy of those 1,032 members who have hitherto forgotten or overlooked the appeals of our late president and council, and whose lethargic consciences have permitted them to disregard their imperative obligations."

The A.A. Day School

next claimed the president's attention. Its progress had indeed been phenomenal. In 1903-4 the number of students was 32, the next year 42, while the present session had been started with 65. The Evening School, too, had been a complete success. The curriculum of the School of Architecture had been very extensively revised, after most careful investigation and thought, and though they did not claim their new syllabus to be perfect, they felt the Association now had the machinery of a complete organisation for a progressive, thorough, yet succinct course of study, which was bound to commend itself to students, as well as to those who had the best interests of our future architects at heart. "We have all along set our faces against the idea which some few misguided individuals hold, that our educational work is a cramming apparatus for administration to unwilling or mentally deficient young men (whose parents think they will make good architects because they are incapable of doing anything else) of those few but needful formulæ of which some knowledge is required at the R.I.B.A. and other examinations. I think we may congratulate ourselves that our revised arrangements will not encourage that idea."

In drafting their new education scheme, however, the council had by no means come to the end of their tether; there were still many directions in which they would like to enlarge the scope of their enterprise—a life class, for instance, which was mooted.

Having thus touched upon the educational work of the Association, Mr. Balfour turned to its social side. During the last few months, he said, there had been considerable activity among the junior ranks, resulting in the establishment of various societies under the ægis of the Association. The council welcomed these—the recently founded Athletic Club and the Musical Society, for example—because they tended so effectually to increase and cement the comradeship which had always been, to some extent, a feature in the career of the Association. The Rifle Club, to be inaugurated by Lord Cheylesmore on October 27th, was another of their offshoots. Architects did not as a rule display a very brave record in the athletic world, but there were exceptions, and Mr. Balfour took occasion to mention their vice-president, Mr. Walter Cave, as an example that there was no reason why a very distinguished athlete should not, in the fulness of time, become a no less distinguished architect.

Finally, in dealing with the affairs of the Association, the president said a few words about

"a somewhat delicate matter,"

no other than the requests which the council received from time to time from ladies desirous of becoming members or attending classes. "These applications we are obliged to decline, because you, gentlemen, voted resolutely in opposition to the proposal for their admission as members. Your decision at that time was of such a determined character that we have hesitated to raise the question again. I, for one, have never been convinced of the cogency of the arguments brought forward, and it has always seemed to me on that one occasion in its career the Association fell away from its vocation, betrayed its traditions, and adopted a policy distinctly reactionary in character. Since 1893, however, times have changed; the female sex has, with its charming insistence, ingratiated itself into many spheres which have hitherto been regarded within the sole prerogative of man. Even the R.I.B.A. has admitted ladies within its jealously-guarded portals of membership, they have invaded the offices of many architects, and from what I can gather all the prophecies of disaster have remained unfulfilled. On the contrary, my inquiries convince me that the converse is the case, that more steady work is the result, and that the beneficial restraint that a woman' presence commands has elevated the tone of those offices. . . . Surely the electorate of to-day in this society cannot be misogynists, with such hard and unrelenting natures as the electorate of 13 years ago!"

With this (bachelor) advocacy of lady architects, Mr. Balfour took his leave of the Association's affairs, and for the remainder of his address gave a running commentary on some general topics. First came a brief reference to the International Congress, and a briefer reference to the Palace of Peace Competition, and, speaking of competitions, Mr. Balfour was naturally led on to make a few remarks about

the competition for the London County Hall,

which the L.C.C., with cosmopolitan benevolence, had opened to the whole world. All, or nearly all, British architects were ready to recognise the merit in the noble modern buildings we saw on the Continent and in the United States, but in this instance we had some justificaton in expressing dissent. The county hall had not, and never could have, any international significance. It was to be a structure for London alone, and London only. "All English architects will commend heartily any steps which the County Council can reasonably take to secure a design of the greatest possible merit, but I feel convinced that in London we want (and we intend to have) an edifice which interprets for us the great heritage of our national architecture. We desire in these days to see no alien structure, no matter of what magnificence, set down to face the quiet serenity of our Palace of Westminster, in the very heart of this great Empire. A British brain must conceive this great new building and British hands must alone bring it into being. I trust I am no 'Little Englander,' but I would ask the London County Council, the educated citizen of London, or that particularly common-sense and level-headed member of the proletariat, the 'man in the street,' whether any of them have for one moment contemplated the possibility of our having raised up for our edification across the river a structure resembling, for instance, the grotesque design for the Hague Palace of Peace, as a monument to the taste of our municipal government, as an everlasting protest by them against the incompetence of our own architects, and as an object-lesson to us of what they deem the highest form of our art.

"I very much fear that the County Council in their collective capacity have not as yet recognised a due appreciation of the broad national characteristics and constituents of our calling which go to form the history of its particular evolution in this land, and still less those subtle phases and delicate variations which invest its study with such infinite charm to the architect himself and to the educated portion of the community. Is this natural solicitude of ours for our own particular national type of architecture an effete product unworthy of consideration at the hands of the Councillors? If that is their view, then perhaps we need not feel so much wonder either at their disregard for the arboreal adornment of our Victoria Embankment, that ruthless destruction of the beautiful emerald ribbon which borders London's noblest highway, that sacrifice of its calm environment, in the cause of those dreadful bugbears, 'utility' and 'class legislation,' the scarring of its surface with tramway lines, and the conversion of its comparative peace for ever into a babel of noisome sounds. . . . It would be a matter for congratulation if the County Council could see their way to institute a Committee of Taste, whose duty it would be to overlook all new schemes before they are put into actual execution, with a view to the avoidance of such unfortunate solecisms as those which have, alas, been perpetrated in the past, and to safeguard us in the future against thoughtless and unnecessary offences against the canons of art and the beauty of our great metropolis. . . ."

A vote of thanks to the president for his address was proposed by Mr. Guy Dawber, seconded by Mr. E. T. Hall, and supported by Mr. A. Needham Wilson and Mr. G. H. Fellowes Prynne. Mr. Dawber referred to the Building Fund debt, and said it was really a great shame that there were more than a thousand members of the Association who had not contributed a penny towards the extinction of the debt. Mr. Hall referred to the incomplete way in which students were educated at the public schools. He pointed out that Mr. Maule, the master of the Architectural Association School, had to reject 25 per cent. of the applicants on this account. As to lady students, he strongly advocated that these should be allowed to become members of the Association.

During the evening prizes and medals were distributed to the students who had been successful during the past session. The reinstatement of Messrs. E. W. Poley and E. W. Sloper was announced, and a vote of thanks was passed to Dr. Pritchard for a donation of several hundred lantern slides and negatives, including an excellent set of Indian architecture as well as Italian, Dalmatian, German and English.

The president announced that the next meeting of the Association would be held on October 19th, when a paper would be read by Mr. Alan Potter on "The Architecture of the Roman Empire."

SOCIETY OF ARCHITECTS.

Annual Report.

The 22nd annual report of the Council of the Society of Architects, to be presented to the annual meeting on October 18th, states that during the past session 57 new members were enrolled, 3 honorary members, and 54 students registered, while there were 32 losses by death, removal or resignation. The total membership is now 778, a net increase of 75 over last year.

Reference is made to the

Revised Articles of Association

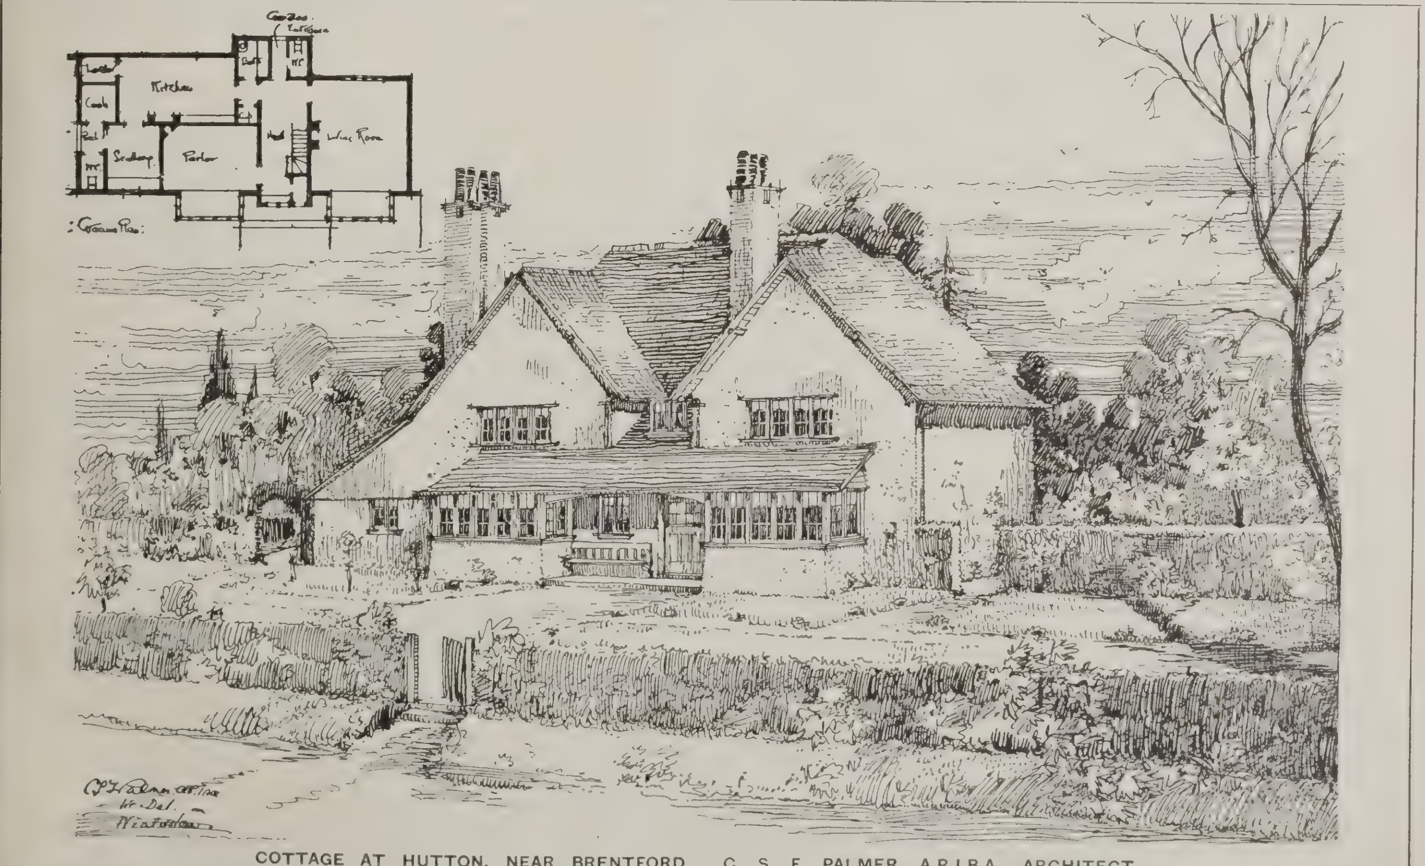
which come into force on November 1st. It has been decided to do away with the class of Associates, and a new class has been provided for students (with their own committee), who have hitherto had no recognised status in the Society. The council has been increased from 12 to 18 members, the office of "honorary corresponding secretary" has been abolished as no longer necessary, and a new class of "retired members" has been formed, so that members retiring from active practice may, under certain conditions, be enabled to continue in their support of the Society.

With regard to

Architects' Registration,

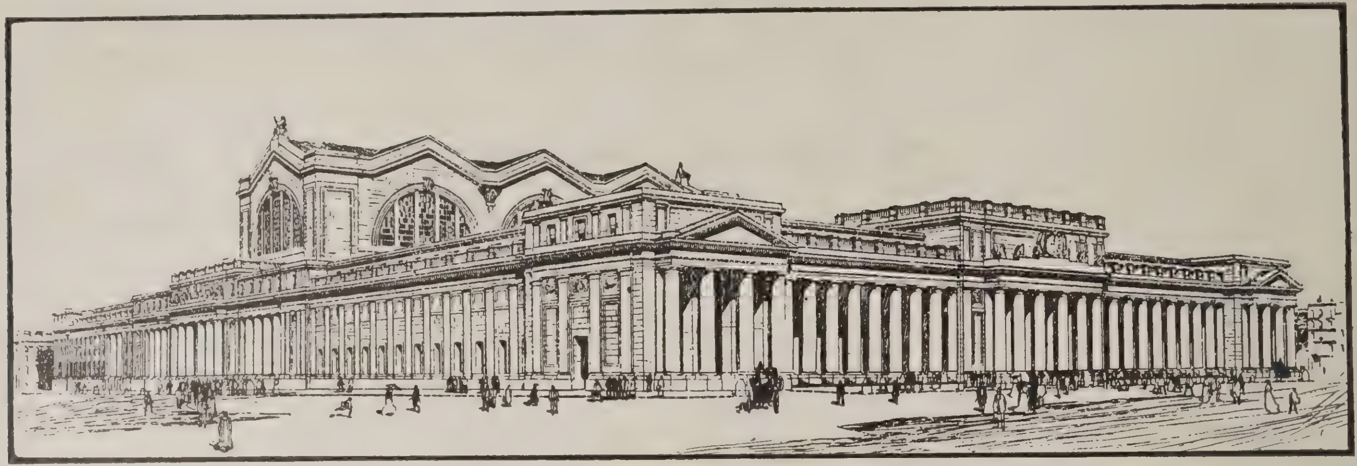
the council makes reference to the resolution in favour of it passed at the International Congress of Architects in July, which resolution was immediately communicated to the members of Parliament, and of the Society, with a view of obtaining their co-operation and support of the measure on its second reading. "Unfortunately the Bill was not reached and its further progress has been for the present delayed, but the council is in a position to say that the Bill has, this session, met with more support from members of the House of Commons than at any other period, and no effort has been or will be spared to secure the object which the council has in view. It may be of interest to know that a member of the Government, Mr. James Bryce, shortly after his speech at the Society's annual dinner, secured the adoption of a clause in the Irish Labourers' Bill, providing that every person whom a district council in Ireland proposes to employ as an architect for the purposes of the Labourers Act, must satisfy the Local Government Board that he is duly qualified to act in that capacity. This is the first instalment of registration, and every architect will be grateful to Mr. Bryce."

Other matters referred to in the report are—the growth of the students' section, due largely to the institution of the Society's travelling studentship of £25; new branches of the Society in Bombay and Johannesburg, the latter formed, the former not yet completed; and the finances of the Society, which are satisfactory.



COTTAGE AT HUTTON, NEAR BRENTFORD. C. S. F. PALMER, A.R.I.B.A., ARCHITECT.

This cottage has been built, with honeycombed rough-cast, roofs covered with local red tiles cesspool drainage, water supply from well. The accommodation on the first floor comprises four bedrooms, with box and cistern rooms. The architect was Mr. C. S. F. Palmer, A.R.I.B.A., of Wealdstone, and the builders were Messrs. Dix and Rodgers, of Brentwood.



General View of Station.

Notes on Competitions

Convalescent and Nurses' Home, Glossop.

For this building more than 90 designs have been received. Mr. Paul Ogden, F.R.I.B.A., of Manchester, is the assessor.

"Architectural Review" Alphabet Competition.

The designs submitted in this competition have been assessed and the awards will be announced in the November issue of the "Review."

List of Competitions Open.

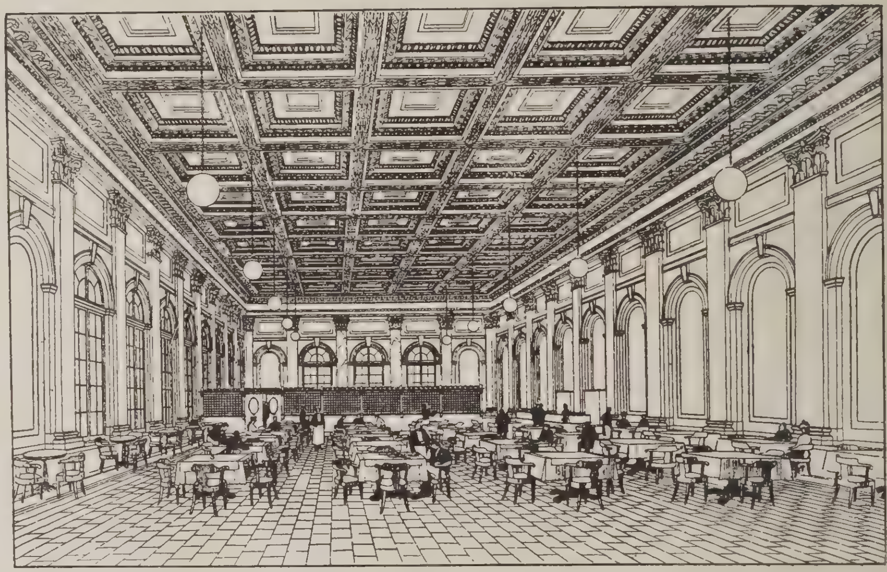
DATE OF DELIVERY	COMPETITION.
Oct. 20	SEWERAGE SCHEME FOR HIGHBRIDGE, Somerset. Premium £20. Particulars from W. C. Shier, Surveyor to the U.D.C., Highbridge.
Oct. 22	SCHOOL AT GAYWOOD, King's Lynn. Particulars from Secretary, County Education Office, 57, London Street, Norwich.
Oct. 31	BOURSE AT CAIRO.—Premiums of £E250 and £E100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Nov. 30	LIBRARY AT NEWTON-IN-MAKERFIELD.—Cost £4,000. Particulars from C. Cole, clerk to U.D.C., Town Hall, Earlestown, Lancs.
Dec. 14	FOUNDLING HOSPITAL, MONTEVIDEO.—Four selected designs in preliminary competition to be awarded £212 each; first premium of £742 in final competition. Particulars from Consulate-General for Uruguay, 5 & 6, Clement's Inn, London, W.C.
No date	LIBRARY AT FRIBOURG, Switzerland. (International competition.) Particulars from "La Direction des Travaux Publics," Fribourg.

NEW BUILDINGS IN LIVERPOOL.

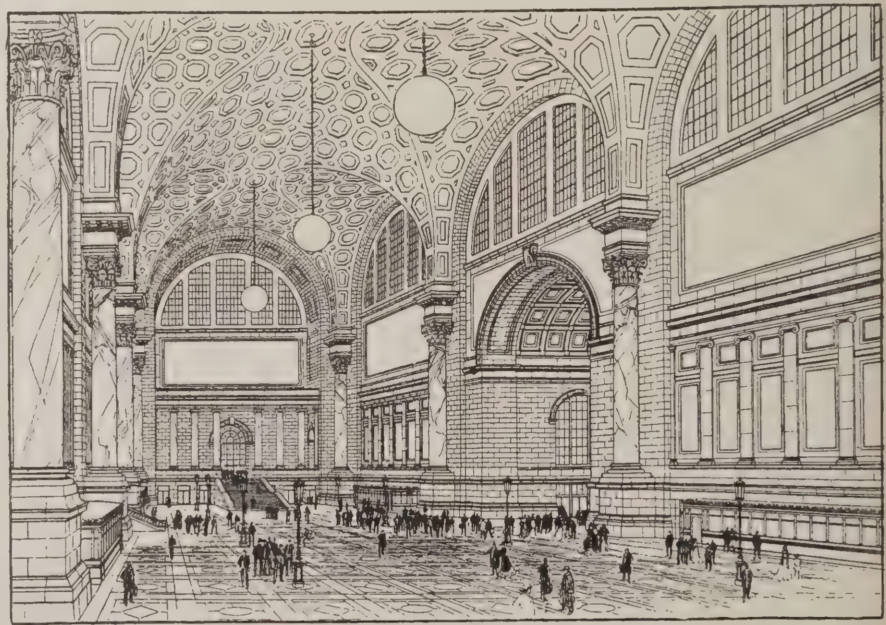
A Correction.

We very much regret that in the article on "New Buildings in Liverpool" published in our issue for last week it was stated (on what we believed to be trustworthy authority) that the architect of the excellent memorial of Renshaw Street Chapel was Mr. Thomas Shelmerdine, the corporation architect and surveyor. This is incorrect. It is true that the garden in which the memorial is situated was laid out by the corporation, but the memorial itself is the work of Mr. Ronald P. Jones, M.A., architect, of London.

With regard to the new offices for the Mersey Docks and Harbour Board, Messrs. Henry Hope & Sons, Ltd., of Birmingham and Manchester, request us to state that they supplied the steel sashes and opening gear for this building; also the metal casements and leaded lights in the new building for Messrs. G. H. Lee & Co.



The Restaurant.



The Waiting Hall.

NEW PENNSYLVANIA RAILROAD STATION, NEW YORK.
McKIM, MEAD AND WHITE, ARCHITECTS.

This huge new station is now in course of erection between Seventh and Ninth Avenues, 31st to 33rd Streets. It is admirably planned, while the above illustrations show that architecturally it should have a very fine effect. The waiting hall is the great feature. This is a very large place, with two restaurants placed at one side. Altogether the scheme has that "big" feeling about it so characteristic of Messrs. McKim, Mead and White's work.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

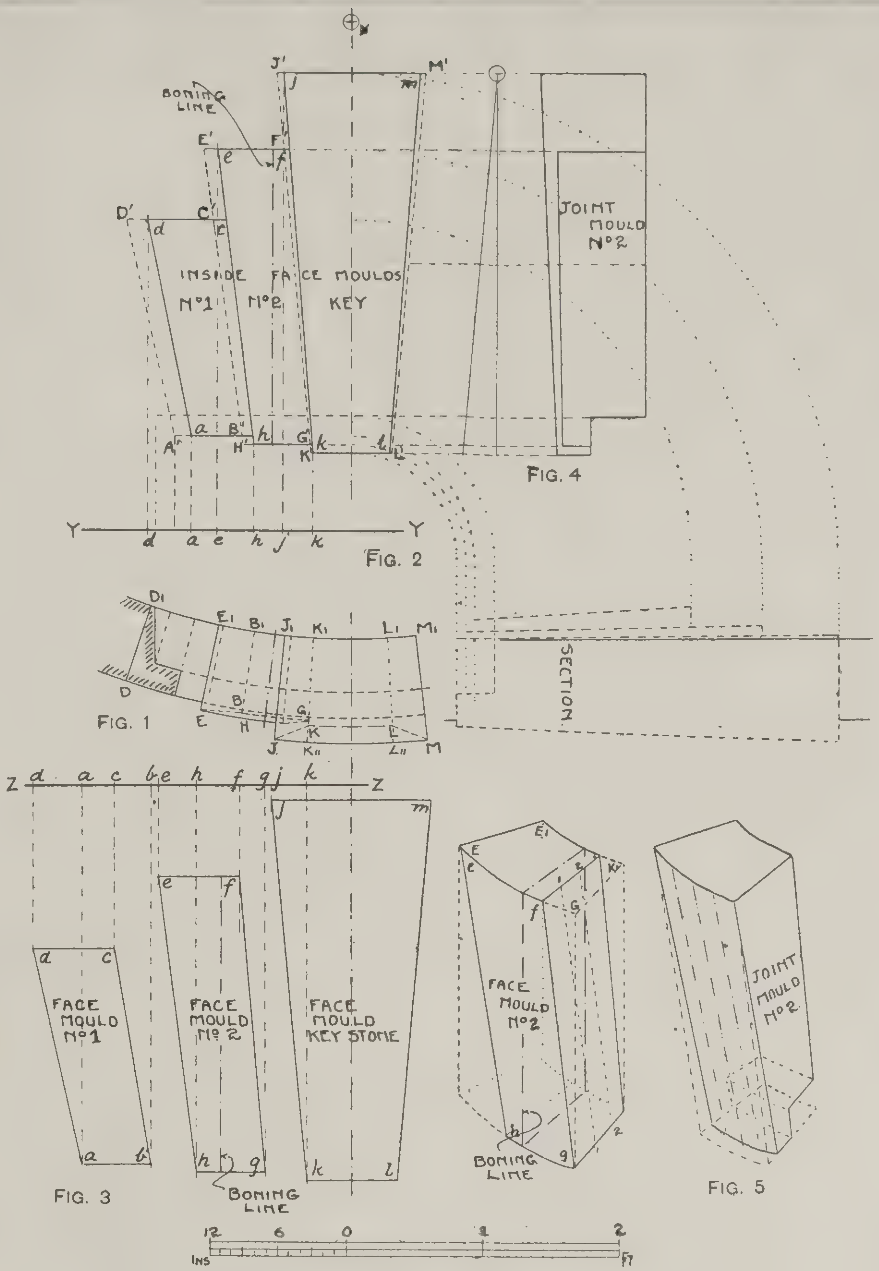
Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

American Roofings.

ABERDARE.—X. writes: "What kind of roofing is most in use in the United States? What patent roofings are used? Can you give an American address for fuller particulars?"

It is rather difficult to say what is the most common roofing material in America, as it is a question of quantity, but probably wood shingles are mostly in evidence, though the better class of property is now roofed with tiles, slates, or tinned sheets; the last-named is much used, both for smaller property and larger buildings in towns. Lead and copper are seldom employed. There is also a class of temporary roofing, such as Ruberoid, and bitumenised felt, and, of course, for flat concrete roofs, asphalt is adopted. Fuller particulars can be obtained from various firms, whose names and addresses you will find in "The Engineering Record," obtainable at Hastings House, Norfolk Street, Strand, W.C., price 6d.; "The American Architect," published at 12, West Fortieth Street, New York; and "The American Carpenter and Builder," published at 196, Fifth Avenue, Chicago.



CUTTING MOULDS FOR FLAT ARCH.

Cutting Moulds for Flat Arch.

SUNDERLAND.—MASON writes: "Please give a simple method of cutting moulds for and working a flat arch over a window on a curved face of a building. Tracing sent."

A plan of the arch is given in Fig. 1, and a section is shown by dotted lines on the right of the plan. An elevation is given in dotted lines on Fig. 2. In these figures essential lines only are shown, so as to avoid crowding. The face of voussoir No. 1 is flush with the wall face. This stone, therefore, lies wholly between the two cylinders forming the face and the back of the wall. The keystone and voussoir No. 2 lean outwards on the face, but at different angles: hence the face of stone No. 2 forms part of a cone, the axis of which coincides with that of the wall cylinder; the face of the keystone is also conical and has the same axial line as No. 2, but a different apex. To cut the moulds, develop the inner face of the arch on the stretch-out line marked YY. This may be done by pricking over the arc of the inner cylinder on plan with a pair of dividers, and plotting the points on YY, as shown in Fig. 2. Project these points up to the elevation and join by means of straight lines. (*See Note No. 2 below.*) The solid lines shown in Fig. 2 represent the development of the inside face moulds. To obtain the mould for the outside face, a stretch-out line is drawn below the plan ZZ. Develop the moulds as before described, each stone being treated as a portion of a cylinder containing the top front arris. The keystone will thus be developed on cylinder or arc of circle marked J M on plan; the soffit lines being produced to the arc in K11, L11. Voussoir No. 2 will be developed on the arc of circle EF, soffit lines being produced as before. Voussoir No. 1 will be developed on the wall face. D B B1 D1 show the extreme points of the bed mould for voussoir No. 1. E E1 K1 and G, produced to the extreme circle, is the bed mould for voussoir No. 2. J M M1 J1 are the extreme points of bed mould of keystone. Bed moulds of the soffits of keystone and No. 2 stone would be required and may be taken direct from the plan. Joint moulds would be required to work the inclined faces of keystone and voussoir No. 2. These are easily projected from the inside development of arch as shown in Fig. 4. To work the stones, rough sketches are given of voussoir No. 2 at two stages of the working. Top and bottom beds are first worked. The bed moulds are then applied (being boned to ensure correct position), the inside cylindrical surface worked, and the outside cylindrical surface boasted sufficiently near to apply the face mould. The joints which are slightly twisted can then be worked. Joint moulds can then be applied and the conical face worked, check out for frame being the last operation. The other stones can be worked in a similar manner. Notes.—(1.) The face moulds may be made on tangent planes, instead of cylindrical surfaces; and this would perhaps be a little more economical; but the writer is of opinion that the method here shown is the simplest to follow. (2.) The front and back arrises of the stones, being made straight in development, are not straight in reality, nor in elevation, but curved; the curvature, however, is very little. (3.) The dotted lines shown on the face of stone in Fig. 5 serve as guides when drafts are being worked. They are not actually generators of the cone, but may be worked to a straight edge without causing material error.

G. R. B.

National Competition Report.

SCARBOROUGH.—F. F. writes: "Where can I get a report of the South Kensington National Competition of the schools of art, and what is the price?"

The report of the judges on the works submitted in the National Competition can be obtained on application to the secretary, Board of Education, South Kensington. The price of it, we believe, is about 6d.

Notes and News

The Bangour Village Asylum, near Edinburgh, was opened by the Earl of Rosebery last week. The architect is Mr. Hippolyte J. Blanc, of Edinburgh.

A Statue of the late Duke of Cambridge is proposed to be erected in front of the new War Office in Whitehall. The pedestal has been designed by Mr. John Belcher, A.R.A.

New Premises of the Scottish Temperance Life Assurance Company have been erected at the eastern end of Newgate Street, London. The building was formally opened on Thursday last.

The Liverpool Architectural Society held its opening meeting of the session on Monday evening, when an inaugural address was delivered by the president, Mr. Edmund Kirby, F.R.I.B.A.

Liverpool's Building Surveyor.—The Liverpool City Council has appointed Mr. J. T. Alexander city building surveyor in succession to Mr. William Goldstraw, who recently resigned the position on superannuation.

New Holloway Infirmary.—It is proposed shortly to commence the construction, at a total estimated cost of £12,000, of a new male infirmary in connection with the present sanatorium at Holloway. Mr. R. Weir Schultz is the architect.

"The Local Government Officer."—The "Public Health Engineer" has been incorporated with this weekly, price 3d. All questions of local government are dealt with in its columns. It is well produced and should be widely read.

Disparity in Tenders.—Considerable difference in the amount of tenders for painting the railings at the Fulham Workhouse recently gave rise to some comment among the Guardians. The lowest tender was £394, and the highest £1,057.

A New Infectious Diseases Hospital is to be erected at Stranraer by Messrs. Spiers and Sons, of Glasgow. The cost of the work, which is to be proceeded with at once, will be between £3,000 and £4,000. Mr. Alexander Thorburn, of Stranraer, is the architect.

A Substitute for Water Carts.—According to the "Liverpool Post," a German town is about to make an experiment with perforated pipes run along the streets by the side of the curb. When needed, the roadways can be sprayed from these pipes, which thus take the place of water-carts.

A New Wing to the Durham University College of Medicine at Newcastle-on-Tyne was opened last week. The new wing has cost £11,000, and extends along the west side of the building, 119ft. in length. The architects were Messrs. Dunn, Hansom & Fenwicke, of Newcastle, and the contractor Mr. Lumsden, of Jarrow.

A Screen by Mr. Bodley.—Lord Burton, in addition to defraying the cost—£700—of reconstructing the organ of St. Paul's Church, Burton-on-Trent, of which he is patron, has instructed Mr. G. F. Bodley, R.A., to design a new screen of wrought iron, richly ornamented, to occupy the arch in the north transept near the pulpit.

New Promenade at Edinburgh.—In Princes Street Gardens, Edinburgh, a wooden model of the proposed new promenade to be formed there, in connection with a widening scheme, has just been erected. It is 50ft. long and 25ft. wide, and will be left standing for about a month in order that the citizens may form an idea of what the promenade would be like.

Lectures on Architecture at London University.—The University of London has started a three years' course of public illustrated lectures on "The History of Architecture," by Mr. Banister Fletcher, F.R.I.B.A. The lecture on "Egyptian Architecture," illustrated by lantern slides, was given on Monday, October 8th, in the University Buildings, Imperial Institute Road, South Kensington.

Changes of Address.—Messrs. Buckland & Haywood-Farmer, architects and surveyors, have moved from 25a, Paradise Street, to Norwich Union Chambers, Congreve Street, Birmingham. — Mr. Frank T. Baggallay, F.R.I.B.A., architect and surveyor, has removed from 50, Berners Street, W., to 3, Bloomsbury Street, W.C.—Mr. T. H. Russell, M.A., architect, has also moved from Berners Street to 3, Bloomsbury Street.—Mr. Henry F. Joel, A.M.I.C.E., consulting electrical engineer, has moved from 31, Wilson Street, E.C., to 110, Strand, W.C.

Old Bristol.—A representative committee of the Bristol Corporation has decided to recommend that the historic Dutch house, a familiar landmark in the centre of the city, shall be preserved. A proposal was made some time ago to demolish it for street improvement purposes. The committee recommend that the ground floor be set back to the new line of the street, and the upper floors restored, the building to project over the pavement.

A New County Asylum is to be erected at Mile End, near Colchester, at an estimated cost of £438,850. The accommodation provided in the buildings is as follows:—Main buildings, males 610, females 716; detached buildings, males 324, females 350; total, 2,000, with accommodation for 225 attendants and about 30 servants. The estimated cost of the works, including all buildings, heating and ventilation, lighting, water supply, drainage, roads and tanks, will be about £220 per bed—a total cost of £438,850.

New Hydro at Peebles.—The rebuilding of the hydropathic establishment at Peebles, which was destroyed by fire in July last year, is being rapidly pushed forward. The new structure is being erected from designs by Mr. James Miller, A.R.S.A., Glasgow. The grand corridor, which is 210 feet in length, will, as formerly, make, with the conservatory, a promenade more than 300 feet long. The cost of building, furnishing, and equipping is estimated at about £100,000. It is expected that the new building will be open by Easter next.

Extensive Salvation Army Building Scheme.—In order to meet the need of suitable premises for their purposes in the great cities, the Salvation Army propose to erect 250 new halls within the next five years. Sixty are now in course of erection. In London 20 buildings have been recently or are about to be erected, and before the end of 1907 the Army expect to add 40 new buildings within Greater London. Projects are also on foot for erecting at least 20 buildings in Glasgow before the end of 1907, while buildings are also about to be commenced in the following towns: Lancaster, Hull, Wakefield, Eccles, Garston, Rothwell (Yorks.), Ware, Morley, Wandsworth, Abertillery, Ashton-under-Lyne, Maerdy, Galashiels, Paisley, East Ham, Ilkeston (Y.P.), Springburn, Shipley (Y.P.), Lerwick, Hull (Y.P.), Bury, Carnforth, Pollokshaws, Cleckheaton, Lewisham (extension), West Norwood, Hucknall, Rowborough, Williamstown, Shettlestone, Derby, Thornton Heath, Clapton Common, Folkestone (Y.P.), Bo'ness, Scunthorpe, Child's Hill, Bromley, St. Albans, Coltishall, Broughton, Bexley Heath, Snodland, Widnes, Bulwell, Acton, Dartford, Doncaster, Belfast, Dorking, Leeds (Y.P.), Maidenhead, Hylton and High Wycombe. The erection of these halls should give an impetus to the building trade in the towns concerned.

The Common Fate.—As it is the common fate of all theatres—especially of American theatres—to burn sooner or later, there are comparatively few that ever reach a venerable age. Just why the Savannah Theatre, at Savannah, Ga., escaped the common lot for nearly ninety years, we know as little as we know why it succumbed at last; but the fact that an American theatre built in 1818 was not burned down until 1906 deserves at least this record.—"American Architect."

Our Plates

House at Southport.

This house is now in course of erection in Hesketh Road, Southport. The walls are covered with white rough-cast, and the windows, &c., dressed with Alderley Edge stone in deep reveals. The roofs are covered with red sand-faced tiles. The building is placed on the site regardless of being parallel with the road, so as to obtain the sun in the best rooms—a feature that is intended to be general hereabouts. This is one of several houses erected in this vicinity by the architect, Mr. A. Jessop Hardwick, F.R.I.B.A., of Eagle Chambers, Kingston-on-Thames. The work is being carried out by the owner of the property.

Group of Country Homesteads.

These little houses were designed to form a country retreat for three friends who wished to live together, but to occupy separate dwellings. The plans consist of a kitchen, or living-room, and a parlour which could be used as a study, with three bedrooms over. The materials proposed to be used are plastered walls, with an undulating trowelled surface whitened, a plinth course of 2in. Dutch hand-made bricks (5 courses to the foot), the chimney stacks to be carried up in the same brick, and the roof to be covered with thick hand-made red and brown tiles: window casements to be of iron with wood frames; all external woodwork to be painted dull peacock green, and internal work cream; gutters to be formed V-shape of elm, with lead lining turned over the edge. The design has been kept simple so that the cost should not exceed £300 each house, and an attempt has been made to carry on the best traditions of the simple country homesteads which are so characteristic a feature of English scenery. The architect is Mr. Alex. S. Carter, of 2, Upper Woburn Place, Tavistock Square, W.C.

New London Buildings

At yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:

Projecting porch in front of No. 10, Lettice Street, Fulham, on the application of Lowndes and Drury. (*Consent.*)

Wood and tile porches to four houses on the west side of Finchley Road, Hampstead, between Ardwick Gardens and Burgess Hill, and to two houses on the south-east side of Burgess Hill, on the application of J. D. Hunter, on behalf of R. V. Hart. (*Consent.*)

Projecting shop front to No. 134, High Street, Notting Hill Gate, Kensington, on the application of C. Spreckley & Co., on behalf of A. Leber. (*Consent.*)

Addition at the rear of No. 8, Coleherne Road, West Brompton, abutting upon Wharfedale Street, on the application of A. G. Harfield, on behalf of G. F. Webb. (*Consent.*)

Porch in front of a house in Oakcroft Road, Lewisham, on the application of E. W. Leeson, on behalf of A. B. Bacon. (*Consent.*)

Buildings with shops on the site of Nos. 188 to 198A (even numbers only) inclusive, Great Portland Street, St. Marylebone, so far as regards the frontage of such buildings to Great Portland Street, on the application of D. Brown, on behalf of R. Mickel & Co. (*Consent.*)

Porches and oriole windows and the fixing of sham half-timber work to 58 houses in Trinity Road, Herne Hill, and to 57 houses in a new street to lead from Trinity Road to Norwood Road, on the application of C. M. Quilter, on behalf of T. L. Searon. (*Consent.*)

Temporary buildings on the northern side of Harrow Road, between Ranelagh Road and Westbury Road, on the application of T. J. Bailey, on behalf of the Education Committee of the Council. (*Consent.*)

Re-erection of the "Duke of Sussex" public-house, abutting upon Commercial Road and Lower Park Road, Peckham, and erection of four houses adjoining, on the application of Hubbard and Moore, on behalf of Barclay, Perkins & Co., Ltd. (*Consent.*)

Two houses with shops on the north side of Evelina Road, Nunhead, on a site between Kirkwood Road and Grimwade Crescent, on the application of N. Pellew. (*Consent.*)

Bay window, and a hood to the doorway, at the proposed new guardians' offices, Prince's Row, Buckingham Palace Road, on the application of F. J. Smith, on behalf of the guardians of the parish of St. George, Hanover Square. (*Consent*).

Projecting iron and glass portico and shelter to the proposed "Hotel Gwalia," on the site of Nos. 11A and 11B, Upper Woburn Place, St. Pancras, on the application of A. Swash, on behalf of J. M. Jenkins. (*Consent.*)

One-storey shops on part of the forecourts of No. 291 to 301 (odd numbers only) inclusive, Cavendish Road, Balham, on the further application of J. H. Beare, (*Consent.*)

One-storey building in front of No. 101, New Church Road, Camberwell, on the application of J. Richards, on behalf of Trier Brothers. (*Refusal.*)

Shops and flats on a site on the eastern side of Askew Road, Hammersmith, to the northward of No. 264, Goldhawk Road, on the application of M. de H. Duval. (*Refusal.*)

Nineteen houses on the north-east side of Moyser Road, Streatham, on the application of F. Loveday. (*Refusal.*)

Urinal at the "Duke of Wurtemberg" public-house, and the retention of a brick wall at less than the prescribed distance from the centre of Brunswick Place, Hatfield Street, Southwark, on the application of H. W. Budd, on behalf of J. Bartlett. (*Consent.*)

One-storey building on the western side of Sugden Street, Camberwell, to abut also upon Depot Street, at less than the prescribed distance from the centres of the roadways of the said streets, on the application of A. E. Biggs, on behalf of S. Lamb. (*Refusal.*)

Buildings on the northern side of Sangley Lane, Catford, abutting upon Plassey Road, on the application of Wilson & Wilkinson, on behalf of T. Buckland. (*Refusal.*)

Four-storey building on the site of Nos. 761 and 763, Old Kent Road, Peckham, on the application of W. Cooper. (*Refusal.*)

Oriel window and iron jib at No. 6, Stanhope Street, St. Pancras, on the application of J. Webster, on behalf of Miss C. C. Ayres. (*Refusal.*)

Twelve houses on the western side of Hither Green Lane, Lewisham, between Brownhill Road, and Sandhurst Road, on the application of H. L. Upham, on behalf of A. Wood & Son. (*Consent.*)

Building on the site of Nos. 11A and 11B, Upper Woburn Place, St. Pancras, at less than the prescribed distance from the centre of Woburn Buildings, on the application of A. Swash, on behalf of J. M. Jenkins. (*Consent*)

New fire brigade station on the site of No. 1A, Hertslet Road, Nos. 80, 82 and 84, Mayton Street, Holloway, and the existing fire brigade station in that street, on the application of O. Fleming, on behalf of the Fire Brigade Committee of the Council. (*Consent.*)

Deviations from the plan certified by the district surveyor so far as relates to the proposed re-erection of No. 78, Wigmore Street, St. Marylebone, on the application of Treadwell and Martin. (*Refusal.*)

Formation of new street for carriage traffic on the Cavendish House estate, Clapham Common, to lead from Cavendish Road to Clapham Common, south side, on the application of T. Young, on behalf of the Cavendish House Estate Co., Ltd. (*Consent.*)

Widening of Wallis's Yard, Prince's Row, Buckingham Palace Road, on the application of F. J. Smith, on behalf of the guardians of the parish of St. George, Hanover Square. (*Consent.*)

Formation of two new streets for carriage traffic out of the south side of Southcroft Road and a new street for carriage traffic out of the east side of Mitcham Road, Tooting, on the application of Milner, Son & White. (*Consent.*)

Re-erection of the "White Horse" public-house, at the corner of Central Street and Paton Street, Finsbury, on the application of Hubbard and Moore, on behalf of A. E. Ball. (*Consent.*)

Boys' Home on the north side of Great Wild Street, Holborn, on the application of E. Runtz and Ford, on behalf of W. Wheatley and others, (*Consent.*)

Two buildings on the north side of Evelina Road, Nunhead, on application of N. Pellew. (*Consent.*)

Additional rooms over the stables at the rear of No. 81, Eaton Square, on the application of G. Trollope & Sons and Colls & Sons, Limited. (*Consent.*)

Ten houses on the east side of Latimer Road, Hammersmith, on the application of M. Minkler. (*Refusal.*)

Iron and concrete building at St. David's Wharf, West Ferry Road, Millwall, on the application of T. A. Watson, on behalf of the Manganese Bronze and Brass Co. (*Refusal.*)

Timekeeper's office, store, iron gangway across stokers' pit, and wooden folding doors across the western end of the existing drum store at the Osborn Street generating station, Whitechapel, on the application of M. W. Jameson, on behalf of the Stepney Metropolitan Borough Council. (*Consent.*)

Re-erection of the "Duke of Sussex" public-house at corner of Commercial Road and Lower Park Road, Peckham, on the application, dated July 11, 1906, of Hubbard and Moore, on behalf of Barclay, Perkins & Co. (*Consent.*)

Three dwelling-houses on land between Claremont Place and Wells Tenements, Lower Road, Rotherhithe, on the application of Stock, Page & Stock, on behalf of the Trustee of the Gomm Estate, Rotherhithe. (*Consent.*)

Buildings abutting on Red Lion Court, Fleet Street, on the application of Griffin and Woollard, on behalf of A. Rust. (*Consent.*)

Residential flats on a site abutting upon Seymour Street, Edgware Road and Connaught Mews, Paddington, on the application of D. Brown, on behalf of Lady E. R. Hope. (*Consent,*)

Projecting architectural features in front of the northern and western sides of Nos. 1 and 2, Royal Exchange Buildings, Cornhill, on the application of Ernest George and Yeates, on behalf of the Union Assurance Society. (*Consent.*)

Porches to Nos. 19 to 25, Ruskin Walk, Herne Hill, on the application of W. Wilkinson, on behalf of F. J. Handford. (*Consent.*)

Projecting one-storey shop in front of No. 160, Uxbridge Road, Hammersmith, on the application of A. E. Hyams, on behalf of A. Eyres. (*Consent.*)

Bay window in front of No. 101, Alexandra Road, St. John's Wood, on the application of R. Banks-Martin, on behalf of J. Salamon. (*Consent.*)

Building on the eastern side of Gray's Inn Road, southward of Clovelly Mansions, on the application of E. J. Edwards, on behalf of the Highways Committee of the Council. (*Consent.*)

Retention of a projecting iron and glass hood over the entrance to No. 4, Percy Villas, Campden Hill, Kensington, on the application of W. Wallis Baldwin, on behalf of the Alliance Economic Investment Co. (*Consent.*)

Projecting sign in front of No. 9, Young Street, Kensington, on the application of J. W. Lawson. (*Consent*).

Addition in front of No. 2, Moreton Gardens, Gilston Road, Kensington, on the application of C. G. F. Rees, on behalf of C. E. Melchers. (*Consent.*)

Four one-storey shops in front of a portion of the "Priory," between Nos. 408 and 418, High Street, Lewisham, on the application of R. C. Fry, on behalf of W. J. Larke and H. O. Larke. (*Consent.*)

Two one-storey shops in front of Nos. 436 and 438, High Street, Lewisham, on the application of R. C. Fry, on behalf of W. J. Larke and H. O. Larke. (*Consent.*)

Iron and glass covered way at No. 20, St. John's Wood Road, St. Marylebone, to abut upon Grove Road, on the application of A. W. G. Harding, on behalf of I. E. Winslow. (*Consent.*)

Projecting sign at No. 49, Wigmore Street, St. Marylebone, on the application of W. Garstin & Sons. (*Consent,*)

Projecting portico in front of No. 71, Portland Place, St. Marylebone, on the application of Fair & Myer, on behalf of G. A. Cohen. (*Consent.*)

Additional storey over an existing one-storey portion in front of No. 2, Elm Tree Road, St. Marylebone, on the application of Howard Ince. (*Consent.*)

Porches in front of Nos. 57 to 75, Danecroft Road, Herne Hill, on the application of F. J. Goddard. (*Consent.*)

Projecting portico in front of No. 38, Grosvenor Place, St. George, Hanover Square, on the application of R. G. Hammond, on behalf of J. Garlick. (*Consent.*)

Two projecting oriel windows and two projecting pilasters at No. 7, Dering Street, St. George, Hanover Square, on the application of H. Kennard. (*Consent*)

Projecting sign at No. 195, Wardour Street, Oxford Street, Strand, on the application of R. Angell, on behalf of N. Bu t & Co., Ltd. (*Consent.*)

Side additions to the existing porch in front of No. 10, Carlton House Terrace, on the application of Detmar Blow & F. Billerey, on behalf of the Right Hon. the Viscount Ridley. (*Consent.*)

Bringing forward the frontage of No. 143, Piccadilly, and the erection of a porch and balcony in front of such building, on the application of R. S. Wornum, on behalf of W. B. Huntingdon. (*Consent.*)

Buildings upon the site of Nos. 338, 340, 342 and 344. Walworth Road, Walworth, on the application of G. A. Lansdown, on behalf of Grose Brothers, Ltd. (*Consent.*)

Porches and oriels in front of Nos. 1, 2, 3 and 4, Braxted Park, Streatham, on the application of P. C. Davies. (*Consent.*)

Three houses on the southern side of Ensham Street, Mitcham Road, Wandsworth on the application of C. G. Baker, on behalf of S. Sinclair. (*Consent.*)

Projecting one-storey shops in front of Nos. 240 to 252, Mitcham Road, Wandsworth, on the application of A. K. Stephens, on behalf of Robertson & Barrie. (*Consent.*)

Bay windows in front of Nos. 19, 21, 23 and 25, Beechhill Road, Eltham, on the application of J. J. Bassett, on behalf of A. Cameron-Corbett. (*Consent.*)

Projecting one-storey shops in front of Nos. 49 and 51, Queen's Road, Dalston, on the application of Young Bros., on behalf of W. oiteux & W. Laing. (*Refusal.*)

One-storey addition at No. 81, Micheldever Road, Lee, abutting upon Manor Lane on the application of G. A. Lansdown, on behalf of W. J. Scudamore & Sons. (*Refusal.*)

Two houses on the north-western side of Herne Hill, Norwood, to abut also upon Poplar Walk, on the application of W. Wilkinson. on behalf of F. J. Handford. (*Refusal.*)

One-storey shops in front of Nos. 90 and 92, Mitcham Lane, Streatham, on the application of Alder and Turrill, on behalf of the Rev. F. Bedale and H. W. Grose. (*Refusal.*)

Boiler seating and chimney shaft at the Walham Green Laundry, Fulham Road, on the application of R. Froude Tucker, on behalf of Laundries, Ltd. (*Consent.*)

Building on the western side of Blomfield Street, Dalston, with the forecourt boundary at less than the prescribed distance from the centre of the roadway of such street, on the application of A. Wood Hill, on behalf of the North London Railway Co. (*Consent.*)

Working-class dwellings on eastern side of Lisson Street, St. Marylebone, abutting upon Mitcham Street, to a height exceeding the width of Mitcham Street, on the application of W. Lockwood, on behalf of Lt.-Col. Sandys, M.P. (*Consent.*)

Urinal on the south side of Marlborough Street, Harrow Road, Paddington, at less than the prescribed distance from the centre of the roadway of such street, on the application of E. B. B. Newton, on behalf of Paddington Metropolitan Borough Council. (*Consent.*)

Six blocks of flats on the western side of Brook Green, Hammersmith, on the application of R. Wilson, (*Consent.*)

Projecting portico in front of No. 7, Compton Terrace, Highbury, on the application of Robinson and Roods, on behalf of Dr. Beauchamp Hall. (*Consent.*)

Wood and iron building of a temporary character at the rear of Nos. 28 and 30, Engleheart Road, Catford, and abutting upon Sangley Road, on the application of Norfolk & Prior, on behalf of Hayden, (*Consent.*)

Building to be known as The German Sailors' Home, on a site abutting upon Rich Street. Beccles Street, and West India Dock Road, Limehouse, on the application of G. Waymouth, on behalf of Sir J. W. Schroder, Bart. (*Consent.*)

Building on the site of Nos. 14, 15 and 16, Cockspur Street, and Nos. 8, 10, 12 and 14, Warwick House Street, Strand, on the application of Stock, Page and Stock, on behalf of the Direction der Disconto-Gesellschaft. (*Consent.*)

Building and a forecourt fence on the western side of Willow Vale, Uxbridge Road, at less than the prescribed distance from the centre of the roadway of such street, on the application of L. J. Williams, on behalf of W. I. Friend. (*Refusal.*)

Additions at the rear of No. 84, King Street. Hammersmith. to abut upon Mansion House Street, on the application of A. F. Hunt. (*Refusal.*)

Buildings on the western side of Vicarage Road, Plumstead, northward of No. 18, on the application of J. Wernham. (*Consent.*)

Retention of No. 82, Brady Street, Bethnal Green, with an irregular open space at the rear, on the application of J. Holmes. (*Consent.*)

Proposed erection of Nos. 37 and 39, Atherfold Street, Stockwell, on the application of V. Vagnolini, on behalf of W. P. Goosey. (*Consent.*)

Addition at rear of No 20, Elvaston Place, Kensington, on the application of F. C. Eden, on behalf of R. Martin-Holland. (*Consent.*)

Addition at rear of Euston fire-station, Euston Road, on the application of O. Fleming, on behalf of the Fire Brigade Committee of the Council. (*Consent.*)

Building on the western side of Hampstead Road, St. Pancras, on the application of Joseph and Smithem, on behalf of the London and North Western Railway Co., Ltd. (*Refusal.*)

Retention of a wood and glass showcase on the forecourt of No. 54, Mare Street, Hackney, on the application of Hinton & Co. (*Consent.*)

External iron and concrete gangway across King John's Court, Great Eastern Street, Hoxton, on the application of T. H. Smith, on behalf of Brown Brothers. (*Consent.*)

Iron gangway across High Street, Wapping, on the application of J. M. Kennard, on behalf of Butler's Wharf, Ltd. (*Consent.*)

Iron and glass shelter at the Grand Theatre, Woolwich, to abut upon Wellington Street and Lower Market Street, on the application of B. Crewe. (*Consent,*)

External iron staircase in front of No. 7, McDermott Road, Peckham, on the application of H. R, Sayer, on behalf of W. D. Crowhurst. (*Refusal.*)

Formation of a street between six blocks of buildings proposed to be erected upon a site on the western side of Brook Green, Hammersmith, on the application of R. Wilson. (*Consent.*)

Formation of a new street for carriage traffic, to lead from Brixton Hill to Lyham Road, Norwood, on the application of Douglas Young and Co., on behalf of F. W. E. Hookey, W. J. Peall, W. T. Key and R. W. Brading. (*Consent.*)

Formation of a new street for carriage traffic on the Sanders estate, to lead from Herne Hill Road to a proposed street to be known as Ruskin Park, Denmark Hill, on the application of R. Ellis & Son, on behalf of R. A. Sanders. (*Consent.*)

Formation of three new streets for carriage traffic to lead out of the south side of Lancaster Road, West Norwood, on the application of C. J. Bentley. (*Consent.*)

Two cooling towers on the south-western side of Burnard Place, Islington, on the application of A. Gay, on behalf of the Islington Metropolitan Borough Council. (*Consent.*)

Station buildings on the northern side of St. John's Hill, Battersea, on the application of C. L. Morgan, on behalf of the London, Brighton and South Coast Railway Co. (*Consent.*)

(Remainder held over till next week.)

NEW WORKS IN SCOTLAND.

An Important Scheme.

Some little time ago the British Aluminium Co., Ltd., having obtained the necessary parliamentary authority to utilise the waters of the West Highlands for mechanical purposes, placed a contract for the erection of new works and village at Kinlochleven, on the borders of Inverness and Argyllshire, with Messrs. M'Laughlin & Harvey, Ltd., of Belfast, Dublin and London, who are also engaged in making large additions to the company's works at Larne Harbour, where the alumina is extracted from the ore. The architects for both schemes are Messrs. W. J. Morley & Son, of Bradford and London.

The Kinlochleven scheme comprises a reservoir, a high-level conduit, a pipe track, and the power house. The reservoir will be about 7½ miles in length, with an average width of more than half a mile, and, when completed, will probably have the largest capacity of any artificial reservoir in Europe. It will obliterate three small lakes, and its approximate capacity will be about 20,000,000,000 gallons. There will be a concrete masonry dam more than half a mile long, its height at the centre being about 80ft. From here the water will be led through a conduit along the hill-face for a distance of about three and a half miles to the head of the pipe line. The conduit will be 8ft. square, built entirely of reinforced concrete, and roofed over with slabs of the same material. The total fall in the conduit is about 20ft. To the power-house the water is to be taken in half a dozen steel pipes of 39in. diameter, and will be delivered to the turbines under a head of more than 900ft.

A short distance west of the site of the power-house, and adjoining Loch Leven, is the site of the model village for the employees. In addition to 200 dwelling houses, there will be the necessary shops, a church, post-office, school, and hospital, so that in a year or two this at present somewhat inaccessible region will be occupied by a fairly numerous industrial community.

With a view to expediting the transport of the necessary plant and materials, the contractors have erected an aerial ropeway between their wharf on Loch Leven and the dam, a distance of about five miles, while for the conveyance of heavy machinery an overland route has been laid down, steep portions being worked by wire-winding winches.

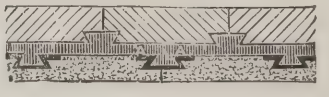
The cost of the undertaking will probably exceed half a million sterling, and the period of construction is estimated at about three years. The engineers for the scheme are Messrs. Thomas Meik & Sons, of London and Edinburgh, and the contract for the reservoir, conduit, dam and pipe track has been let to the firm of Sir John Jackson, Ltd.

Bournemouth's Municipal Buildings Scheme.—At the last meeting of the Bournemouth County Borough Council the new municipal buildings scheme was discussed. The Horse Shoe site has been abandoned and the committee has now been instructed to find another site, the scheme meanwhile being shelved. The joint architects are Messrs. C. E. Mallows and F. W. Lacey, to whom, it was agreed, £500 should be paid on account of out-of-pocket expenses.

Trade and Craft.

Finishing Concrete Floors.

We have referred in an article on the finishing of concrete floors in our "Concrete and Steel Supplement" in this issue to the troubles that moisture causes in wood-block floors. A method has been invented which certainly seems to overcome a great deal of the difficulty of securing a satisfactory wood-block floor. This system is not a new one, but has now been in use for more than 20 years. It is Ebner's "Hydrofuge" system. This has secured a number of gold medals at international exhibitions, and about 1,000,000 yards super have been laid. The system is clearly illustrated in the small sectional diagram here reproduced. Iron channels are embedded in and upon the top of the concrete 12ins. apart. A layer of bitumen is then laid on the concrete and entering into these channels. Finally, upon all come the blocks, which, as will be seen, have their edges cut to a groove which forms a dovetail into which the bitumen penetrates. The bitumen, being thus keyed into both the concrete and wood blocks, holds down the latter.



The method of executing the work is simply to embed the above-mentioned iron channels in the floating coat of the concrete while it is plastic. When this floating is thoroughly set and dried, a hard-setting bitumen, made hot so as to become liquid, is poured upon the surface of the concrete a little at a time, just sufficient to serve for two or three blocks. The wood blocks are then pressed down upon the bitumen before it cools. The bitumen should be kept to a uniform thickness of about $\frac{1}{8}$in. to $\frac{1}{4}$in. A staff of three men can lay such a floor at the rate of 100ft. super. per man per day and completely finished, including polishing, at the rate of 60ft. super. per day. This method is carried out by Mr. J. F. Ebner, of 150, Old Street, St. Luke's, London, E.C. Mr. Ebner also executes floors in terrazzo and in parquet, and he has also more recently placed his "Ebnerite" upon the market, this being the name he gives to a method of finishing concrete floors with a material composed of wood fibre, fine mineral powder and a cementing liquid, laid in a plastic state with a trowel, and solidifying in about 35 hours. It can be used either rough or polished, oiled and beeswaxed like a parquet floor.

The Paving of Whitehall.—At last Thursday's meeting of the Westminster City Council the Works Committee submitted a report on the paving of Whitehall, in which they stated that large quantities of defective blocks had been delivered on the streets and had been rejected by the city engineer. Notwithstanding these wholesale rejections, however, the contractors, the Acme Flooring and Paving Company, 1904, Ltd., continued to deliver and use blocks of a similar or worse character. A resolution was passed empowering the Committee to take steps to obtain the execution of the paving works referred to in the contract which the company had failed to execute, and to enter into other contracts, charging the company with any increased cost which the Committee might necessarily incur.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Dedham (Essex).—For drainage works for the Lexden and Winstree R.D.C. Messrs. Sands and Walker, engineers, Milton Chambers, Nottingham:—

T. C. Thompson, Upminster ...	£3,849	7	0

Saunders & Taylor	15,970
Dargue, Griffiths & Co.*	15,536

*Accepted.

The "DEVON" FIRE is made in sizes and designs to suit any room, and can easily be fixed to existing mantels.

The saving in coal will be found to quickly repay the cost of installation, to say nothing of increased comfort, better ventilation, and reduction in servants' work.

Supplied in a charming variety of the most artistic colours, in tiles, brick, or briquettes, and faience or antique glazed blocks.

EASILY FIXED TO EXISTING MANTELS.

Price from £2 upwards.

CANDY & Co., Ltd.,

are the Sole Manufacturers of the

"DEVON" FIRE.

ARTISTIC - INEXPENSIVE - EFFICIENT.

IMPORTANT TESTS OF
OPEN DOMESTIC GRATES

carried out officially by The Smoke Abatement Society in conjunction with H.M. Office of Works, at the New Government Buildings in Parliament Street, London.

See Report in "Lancet," May 19th, 1906—

> "As a final result of the whole of the tests, the examiners find that of the Grates submitted those of Messrs. Candy & Co., and two other firms, are the best, showing practically equal results. The amount of coal consumed by these grates was found to be moderate in comparative proportion with temperature obtained; the fires were bright and clear."

N.B.—Thirty-seven grates were tested, including nearly all the best known modern types.

Send for Illustrated Price Lists and full copy of Report of Tests.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Oct. 11. Plympton.—*Erection of a new bathroom and lavatory* in the master's quarters at the Union Workhouse, Plympton. Plans and specifications may be seen, and further particulars obtained at the office of F. A. Clark, 83, Old Town Street, Plymouth. Sealed tenders, endorsed "Alterations," must be sent to W. Bickle, solicitor, Temple Chambers, Westwell Street, Plymouth, clerk, not later than Oct. 11.

Oct. 11. Belfast.—*Erection of additional warehouse* at Adelaide Street for Messrs. M'Bride and Williams. Plans and specifications can be seen of Young & Mackenzie, Scottish Provident Buildings, Belfast, and schedule of quantities obtained from W. H. Stephens and Son, on payment of a deposit of £2 2s. Sealed and endorsed tenders to be lodged with Young & Mackenzie, Scottish Provident Buildings, Belfast, on or before Oct. 11.

Oct. 12. Scarborough.—*Pulling down and rebuilding the premises, No 20, Newborough Street*, for M. J. Thompson. May see the plans and obtain other particulars of J. C. Petch, architect, Bar Chambers, Scarborough. Tenders to be sent to him at or before 10 o'clock a.m., on Oct. 12.

Oct. 12. Llanidloes.—*Erection of a new public building* at Llanidloes, Montgomeryshire, for Mr. David Davies, M.P., of Plas Dinam, Llandinam, Montgomeryshire. Bills of quantities and other particulars may be obtained of Shayler and Ridge, architects, Bank Chambers, Oswestry, and tenders, endorsed "Tenders for Public Building at Llanidloes," must be received by the architects before noon on Oct. 12. Tenderers will be required to deposit with the architect.

Oct. 13. Scredington.—*Erection of new rooms* and extensive repairs to a cottage in Mareham Lane. Tenders to be sent to B. Smith & Co., Horbling, Folkingham, not later than Oct. 13. Specifications and plan can be seen at their offices.

Oct. 13. Bridgend.—*Erecting a Mortuary, &c.*, at the Bridgend and Cowbridge Workhouse. Plans, &c., may be seen, and all particulars obtained, at the office of P. J. Thomas, architect, Bridgend. Tenders endorsed "Mortuary," to be received by R. Harmar Cox, clerk, Union Offices, Bridgend, before Oct. 13.

Oct. 13. Aberystwyth.—*Erection of proposed new villa* in Benadl Road, Buarth, Aberystwyth, for W. James, Esq., Blaengarw, South Wales. Plans and specifications may be seen of J. Lewis-Evans, architect and surveyor, 21, Great Darkgate Street, where sealed tenders are to be sent not later than noon Oct. 13.

Oct. 13. Torpoint.—*Structural alterations to the retort house* for the Directors of the Torpoint Coal and Gas Co. Plans and specifications may be seen (by appointment) on application to E. F. Clear, secretary, Torpoint, to whom sealed tenders, endorsed "Alterations to Retort House," should be sent on or before October 13 at noon.

Oct. 13. Nantymoel.—*Erection of a new police station* at Nantymoel, for the Standing Joint Committee of the Glamorgan Quarter Sessions and C.C. Fair wages clause. Plans and specification of the works may be seen and copies of the bill of quantities obtained at the Police Station, Tynewydd, and of T. M. Franklen, clerk of the County Council, Glamorgan County Council Offices, Westgate Street, Cardiff. Sealed tenders are to be delivered to the clerk, together with the full names and addresses of two substantial sureties, not later than Oct. 13, marked outside, "Tender for Nantymoel Police Station."

Oct. 13. London, W.—*Pulling down of the existing brick-arched carriageway bridge* over the canal, and the construction and erection of a new brick, concrete, and steel carriageway bridge (30ft. span), a new tollkeeper's office, and the execution of certain works appurtenant thereto, all in and about Warwick Avenue. Contract No. 1.—Building constructional works, &c. Contract No. 2.—Steelwork, &c. Contract No. 3.—Nos. 1 and 2 together. Forms of tender, general conditions, specifications, and bills of quantities will be furnished upon application to E. B. B. Newton, Assoc.M.Inst.C.E., F.S.I., borough surveyor, Paddington, W., after payment to the Borough Accountant of £1 for a set containing one copy for each document. Further particulars may be obtained, and the drawings seen, on application at the Borough Surveyor's Office between the hours of 10 a.m. and 4 p.m. (Saturdays, 10 a.m. and 1 p.m.), or on written inquiry to the Borough Surveyor and the receipt by him of stamped addressed envelope for reply. Tenders must be sent in sealed and endorsed "Reconstruction of Warwick Avenue Bridge," "No. 1, Building Constructional Works," "No. 2, Steelwork," or "No. 3, Nos. 1 and 2 together," directed to the Town Clerk, and delivered at his office, Town Hall, Paddington, W., not later than Oct. 13, after which no tender will be received.

Oct. 16. Durham.—*Alterations to Wolviston Council School*. Plans, specifications, and conditions of contract may be seen at the school and the architect's office. Quantities may be obtained on application to the architect. Sealed, endorsed tenders to be delivered to W. Rushworth, F.R.I.B.A., architect, County Education Offices, Shire Hall, Durham, not later than Oct. 16.

Oct. 16. London, E.C.—*Alterations and additions to the underground conveniences* in Bishopsgate Street Without and Aldgate, according to drawings and specifications to be seen at the office of the engineer to the Corporation, Guildhall, between the hours of 10 a.m. and 5 p.m., and bills of quantities and forms of tender may be obtained on payment of £1. Tenders on the before-mentioned forms must be addressed Town Clerk, Public Health Department, Guildhall, E.C., endorsed "Underground Conveniences," and delivered at the office of the hallkeeper, Guildhall, between the hours of 12.30 and 1.30 p.m., on or before Oct. 16, when the Streets Committee of the Corporation of London will meet at the Guildhall at 1.30 o'clock to receive tenders.

Oct. 16. Barry.—*Alterations and additions to the High Street Old Boys' and Infants' Schools, Barry*. Plans and specifications can be seen at the office of G. A. Birkenhead, architect, Caledonian Chambers, St. Mary Street, Cardiff, and 21, Park Avenue, Barry, from whom bills of quantities can be obtained on payment of £2 2s. The bill of quantities must be sent in under separate cover with the name of the person tendering on the outside. The tenders to be sent, sealed and endorsed, to T. B. Tordoff, clerk, Council Offices, Barry, before 5 o'clock on Oct. 16.

Oct. 17. Cleethorpes.—*Erection of an elementary school* in Elliston Street, Cleethorpes, for the Lindsey County Council Education Committee Bills of quantities and form of tender may be had on application to Scorer & Gamble, architects, Bank Street Chambers, Lincoln, on payment to them of £2 2s. The drawings and conditions of contract may be inspected at the offices of the architects. Tenders must be delivered to S. M. Grant, secretary, 286, High Street, Lincoln, in the envelope provided for that purpose, before 10 a.m. on Oct. 17.

Oct. 18. London, E.—*Erection of a disinfector shed* at the Workhouse, St. Leonard St., London, E., for the Stepney Union. Specification and forms of tender, &c., can be obtained on application to T. G. Stacey, clerk, Guardians offices, Barnes Street, Ratcliffe, E., and such tenders must be delivered to him on or before 4 o'clock on Oct. 18.

Oct. 18. Stafford.—*Erection of a weigh office* and for the building of the necessary foundations required for new weighbridge at the Union Workhouse for the Guardians of the Stafford Union. Plans and specifications may be seen on application to the Master of the Workhouse during the usual office hours. Sealed Tenders, endorsed "Weigh Office and Foundations," to be sent to W. Morgan, clerk, 4, Martin Street, Stafford, not later than Oct. 18.

Oct. 18. Salford.—*Removal of existing buildings and the erection of cottages* in Springfield Lane, Salford. Forms of tender, specification, and drawings may be obtained at the Borough Engineer's Office, Town Hall, Salford, upon payment of £2 2s. Tenders, endorsed "Springfield Lane Housing Scheme," addressed to the Chairman of the Health Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 11 a.m., Oct. 18.

Oct 19. Lerwick.—*Erection of a fish mart and offices* proposed to be erected on Alexandra Wharf, Lerwick. Plans and specifications may be seen with A. Sandison, clerk, at Lerwick, and with J. Barron, M.Inst.C.E., 216 Union Street, Aberdeen. Tenders to be lodged with the clerk on or before Oct. 19.

Oct. 20. Windermere.—*Addition of rooms and alterations of W.C.'s and Drains, &c* , at Ravrigg Hall, Windermere, for the Rev. Hugh Fleming. Plans and specifications of the work may be seen at the Hall on application to the housekeeper, and tenders must be sent in to John Banks, surveyor, Kendal, on or before Oct. 20.

Oct. 20. Stafford.—*New High School for girls*, Stafford, for the Staffordshire Education Committee. Builders desiring to tender for this work should apply to G. Balfour, Director of Education, County Education Offices, Stafford, on or before Oct. 20. Quantities will be supplied, for which a deposit of £2 2s. will be charged.

Oct. 20. Pontlottyn.—*Erection of a library and institute* at Pontlottyn, for the Trustees of the Pontlottyn Workmen's Library. Plans and specifications may be seen and bill of quantities obtained at the School House, Pontlottyn, on payment of £1 1s. Fair wages clause. Sealed tenders to be sent to the Secretary, W. Jones, School House, Pontlottyn, on or before Oct. 20.

Oct. 20. Langport.—*Alterations and improvements at the Council School, Langport*, for the County Education Committee. Drawings and specification can be seen at the office of Samson & Cottam, Bridgwater, from whom further information may be obtained. Tenders must be delivered at the County Education Office, Weston-super-Mare, not later than 12 noon, on Oct. 20.

Oct. 20. Haverfordwest.—*Reconstruction of the meat market*, including new steel roof with elliptical lattice-braced principals, &c. The drawings and specifications may be inspected at the Council Chamber, High Street, Haverfordwest, between 10 a.m. and 5 p.m. or at the office of J. Preece James, architect, Tenby. A deposit of £2 2s. will be required. Tenders, sealed and endorsed "Reconstruction of Market," on the forms supplied, are to be sent to R. T. P. Williams, town clerk, Haverfordwest, on or before Oct. 20.

Oct. 22. Hull.—*Construction of a timber wharf*, being an extension of the existing herring stage on the north side of the St. Andrew's Dock Extension, Hull. Plans may be seen and copies of specification obtained, on personal application to T. M. Newell, Dock Office, Hull. Sealed tenders, endorsed "Tender for Timber Wharf, St. Andrew's Dock Extension, Hull," to be delivered at the secretary's office, York, not later than 12 noon on Oct. 22.

Oct. 22. Cardiff.—*Alterations and additions to No. 4, St. John's Square*, Cardiff, to convert the same into club premises. The plans and specifications may be seen at the office of W. H. D. Caple, architect, 2, Church Street, Cardiff, from whom copies of the quantities may be obtained on deposit of £1 1s. Sealed and endorsed tenders to be delivered to the architect on or before Oct. 22.

Oct. 22. Mold.—*Erection and carrying out of the following works* for the Flintshire Educational Committee:—(*a*) The erection of a new school for 300 infants at Golftyn, Connah's Quay. (*b*) The erection of a new school for 300 infants at Custom House Lane, Connah's Quay. (*c*) Certain alterations and additions at the Abermorddu Council School, near Wrexham. Plans can be seen and specifications, bills of quantities, and form of tender can be obtained at the office of S. Evans, county surveyor, County Buildings, Mold, between the hours of 10 a.m. and 5 p.m. on payment of £2 2s. Tenders, duly made on the prescribed forms and enclosed in an envelope, which will be supplied, must be delivered at the County Education Offices, Mold, not later than the first post on Oct. 22.

Oct. 23. Bridport.—*Erection of a secondary school*, with accommodation for 150 pupils on a site in St. Andrew's Road, Bridport, for the Town Council. Drawings and specifications may be inspected at the offices of F. Cooper, architect, 77, East Street, Bridport. Sealed tenders, endorsed "Secondary School," and addressed to C. G. Nantes, town clerk, must be delivered before noon on Oct. 23.

Oct. 24. St. Helens.—*Additions to Cowley Middle Schools*, Cowley Hill Lane, St. Helens, for the County Borough Council. On deposit of the sum of £1 1s., plans and specifications may be inspected and bills of quantities and conditions of contract obtained at the offices of Frank S. Biram, architect, Hardshaw Street, St. Helens. Sealed tenders, endorsed "Tender for Additions to Cowley Schools," must be delivered to W. H. Andrew, town clerk, Town Hall, St. Helens, Lancashire, not later than 10 a.m. on Oct. 24.

Oct. 24. St. Helens.—*Erection of new schools* at Parr, St. Helens, for the Borough Council. On deposit of the sum of £1 1s., plans and specifications may be inspected and bills of quantities and conditions of contract obtained of F. S. Biram, architect, Hardshaw Street, St. Helens. Sealed tenders, endorsed "Tender for New Schools, Parr," must be delivered to W. H. Andrew, town clerk, Town Hall, St. Helens, Lancashire, on Oct. 24.

Oct. 25. London, S.W.—*Alteration and extension of the laundry* at the Workhouse, Swanfield Road, Wandsworth, for the Guardians of the Wandsworth Union. Persons desirous of tendering may inspect the drawings and specification, and obtain a copy of the bills of quantities and form of tender between the hours of 10 a.m. and 4 p.m. (Saturdays until 1 p.m.) upon application at the Guardians' Offices, St. John's Hill, Wandsworth, near Clapham Junction Railway Station, and by depositing with F. W. Piper, clerk, £2. Tenders, upon the form supplied must be signed, enclosed in the envelope provided, and delivered to F. W. Piper, clerk, Union Offices, St. John's Hill, Wandsworth, S.W., not later than 10 o'clock a.m. on Oct. 25.

Oct. 27. Chester-le-Street.—*Erection of a public sanitary convenience* at Usworth Village, for the R.D.C. Intending contractors to meet near The Church, Usworth Village, at 2 p.m. on Oct. 16, when J. H. Mole, surveyor to the Council, will point out the site and furnish all necessary particulars on payment of a deposit of £1. Written offers endorsed "Usworth Sanitary Convenience," to reach R. V. Dickinson, clerk to the Council, Union Offices, Chester-le-Street, not later than Oct. 27.

Oct. 30. Manchester.—*Erection of the Oswald Road Municipal School*, Chorlton-cum-Hardy, Manchester. Plans may be seen, and a copy of the bills of quantities (including specification) obtained at the Education Offices, Deansgate, Manchester, on a deposit of £2 2s. Tenders, on the official forms, and enclosed in the envelopes provided, must be delivered not later than Oct. 30. Cheques to be made payable to the Accountant, Education Offices, Deansgate, Manchester.

No date. Aberystwyth.—*Improvements and additions* to 34, North Parade, Aberystwyth. Plans and specifications may be inspected at the office of G. Jones & Son, MM.S.A., architects and surveyors, Llanbadarn Road, Aberystwyth.

No date. Long Eaton.—Contract No. 1.—*Erection of bakery, loading shed, stables, boiler house, &c.*, in Fletcher Street, Long Eaton. Contract No. 2.—For the steel roofing and steel girders and stanchions for the above buildings. Contract No. 3.—For the plumbing and glazing for the above buildings. Persons desirous of tendering for the above works, or any of them, for the Long Eaton Working Men's Co-operative Society, Ltd., may make written application to Ridgway & Smith, architects, Long Eaton, near Nottingham, with a deposit of £2 2s. for Contract No. 1 and £1 1s. for either No. 2 or No. 3 contracts. Fair wages clause.

Tenders, upon printed forms to be obtained of E. J. Mott, Clerk to the Guardians, Guardians' Offices, 129, Fulham Palace Road, Hammersmith, W., must be sent in not later than 10 o'clock Oct. 11, sealed and endorsed "Tender for Granite."

Oct. 11. London, N.E.—*Kerbing, channelling, paving, making-up, &c.*, of (a) Fletching Road, Clapton, and (b) Thornby Road, Clapton, for the Metropolitan Borough of Hackney. The general conditions of contract, and the specifications and plans and sections may be inspected, and copies of the bills of quantities and forms of tender obtained, on application to N. Scorgie, M.Inst.C.E., borough engineer and surveyor, and on payment of the sum of £1 1s. Tenders, sealed and endorsed "New Street Works," must be delivered at the Town Hall, Hackney, N.E., not later than 5 p.m. on Oct. 11. Fair wages clause.

Oct. 13. Wakefield.—*Alterations and additions to the following schools:*—New School at Birstall; Denholme District Provided School; Earby Riley Street Provided School, Thornton-in-Craven; Snaith Wesleyan School. Plans may be seen, and quantities obtained, on application to J. Vickers-Edwards, county architect, County Hall, Wakefield. A deposit of £1 is required in each case, cheques to be sent to the West Riding Treasurer, County Hall, Wakefield. Sealed tenders, properly endorsed, to be sent to the county architect not later than 10.30 a.m. on Oct. 13.

Oct. 15. Southgate.—1. *For making-up, kerbing, channelling, and paving* of a length of Bowes Road, between Brownlow and Stanley Roads. 2 For the paving of the footpaths in Warwick Road, Bowes Park, for the U.D.C. Plans may be seen on application to C. G. Lawson, C.E., Council's surveyor, from whom copies of the specifications and forms of tender may be obtained on depositing £2 in cash. Separate sealed tenders, endorsed (1) "Making-up of Bowes Road," and (2) "Paving Warwick Road," must be addressed to and reach W. M. Ellenor, clerk of the Council, Council Offices, Palmer's Green, N., not later than 12 o'clock at noon on Oct. 15.

Oct. 15. Plymouth.—*Making-up and completing* under Section 150 of the Public Health Act, 1875, the following streets and lanes—Neath Road lane north, No. 2. South View Terrace lane, No. 3. Beaumont Road lane, south, No. 3. Tenders are invited for carrying out the works. Plans and specifications, and conditions upon which forms of tender will be granted, may be seen and bills of quantities obtained of J. Paton, borough engineer, Municipal Offices, Plymouth. Sealed tenders must be delivered at the said offices not later than 5 p.m. on Oct. 15.

Oct. 15. East Preston.—*Steam rolling upon the roads* throughout the district, for the East Preston R.D.C. Tenders, stating weight of roller and other particulars, with price per day inclusive, to be sent to A. Shelly, clerk to the Council, Town Offices, Littlehampton, not later than October 15. The rolling will have to be done at such times and in such manner as the Council or their surveyor may from time to time direct. The person whose tender is accepted will be required to enter into a contract to supply the roller upon receiving six days' notice, under a penalty.

Oct. 16. Caerphilly.—*Paving, kerbing, channelling, flagging, sewering, forming and metalling* the following private streets within the district for the U.D.C.—1. Station Road, Senghenydd. 2. Station Terrace, Senghenydd. 3. High Street, Abertridwr. 4. Central Terrace, Rees Terrace, Ffrwd Terrace, Glenview Terrace, and Wingfield Villas, Llanbradach. Plans and specifications may be seen and form of tender obtained at the Surveyor's Department, Council Offices. Caerphilly, upon depositing the sum of £1 1s. Sealed tenders, endorsed "Street Works," to be addressed to the Chairman of the Council, and delivered at the Council Offices, Caerphilly, not later than Oct. 16.

Oct. 17. London, W.—*Making-up and paving Dunraven Road* (part of) *and Osman Road* (part of) for the Borough Council of Hammersmith. Plans and specifications may be seen and forms of tender obtained on application to H. Mair borough surveyor. Sealed tenders, endorsed "Tenders for Paving Works," must be delivered to H. Thompson, town clerk, Town Hall, Broadway, Hammersmith, not later than 6 p.m. on Oct. 17.

Oct. 22. Batley.—*Levelling, paving, flagging, channelling and completing* of each of the following streets—The Crofts, Jowett's Yard, and William Street, in the Borough of Batley. Plans, sections, and specifications of the said works respectively may be seen on application to O. J. Kirby, borough engineer and surveyor, Town Hall, Batley. Sealed tenders, on forms which may be obtained from the borough surveyor, properly endorsed, to be delivered to J. H. Craik, town clerk, Town Clerk's Office, Town Hall, Batley, not later than Oct. 22.

Oct. 22. Bishop's Stortford.—*Supply of 1,600 tons, or thereabouts, of 1¾-in. broken granite*, and 160 tons, or thereabouts, of ½-in. granite chippings for the U.D.C., to be delivered at the Bishop's Stortford railway station in quantities of about 20 tons per day, or at the Council's wharf on the river Stort in full barge loads as may be agreed upon. Persons tendering to state in their tender the price at which they will be prepared to deliver Tar-Macadam or Tarmac in full truck loads at Bishop's Stortford railway station. Forms of tender can be obtained on application to T. Swatheridge, clerk, Council Offices, North Street, Bishop's Stortford. Tenders, accompanied by samples of the material proposed to be supplied, to be sent to him by 4 o'clock p.m. on Oct. 22.

SANITARY.

Oct. 15. Skegness.—*Laying 772 yards of 9-in. pipe sewer* alongside Golf Links on Drummond Road, at a depth varying between 10½ and 4½ feet deep, with appurtenant works for the U.D.C. Plans and specification can be seen at the Office of Elliott & Brown, engineers, Burton Buildings, Parliament Street, Nottingham, and copies of the bills of quantities and form of tender obtained on deposit of £2 2s. Sealed tenders, addressed to G. J. Dashper, solicitor and clerk to the Council, Council Offices, Skegness, and endorsed "Tenders for Sewerage Works," to be delivered on or before the first post on Oct. 15.

Oct. 19. Surbiton.—*Re-constructing the Combined Drains* belonging to Nos. 1 to 4, Elmden Terrace, Douglas Road; Nos. 17, 18 and 19, Cleaveland Road; and Nos. 9 and 10, St. Mary's Road, Surbiton for the U.D.C. Plans may be seen, and specification and form of tender may be obtained upon application to W. Nesfield, A.R. San I., Sanitary Inspector, at the Council Offices during office hours, on payment of a deposit of 10s. 6d. Sealed tenders, made out on the form and enclosed in the envelope supplied, must be delivered at the Council Offices at or before 10 a.m. on Oct. 19.

TIMBER.

Oct. 22. Ventnor.—*Construction of a timber groyne* 170ft. in length, on the eastern shore of Ventnor, for the U.D.C. Detailed specification and plans may be inspected at the office of the town surveyor, Town Hall, Ventnor. Tenders, marked "Groyne," must be received by R. M. Barr, Clerk of the Council, Town Hall, Ventnor, not later than Oct. 22.

MISCELLANEOUS.

Oct. 12. Leigh.—*Supply of about 400 tons of best hand-picked lime*, to be delivered at the Sewage Works, Mather Lane, Leigh, during the ensuing 12 months, for the Leigh and Atherton Joint Sewerage Board. Sealed tenders, marked "Lime Contract," to be delivered to D. Schofield, clerk, Town Hall, Atherton, not later than Oct. 12.

TOO LATE FOR CLASSIFICATION.

Oct. 15. Mold.—*Providing benches, shelves, cupboards for Chemical Laboratory*, gallery, tables, dresser for Cookery Class Room, shelving for Library, requisites for Laundry, for the County School. Specifications and models can be seen at the School by appointment. Tenders to be sent to W. R. Howard Evans, solicitor, Mold, clerk to the Local Governors, not later than Oct. 15.

Oct. 15. Edinburgh.—*Erection of a convenience and cloakroom* for women at Holyrood, conform to plans, specification and schedule of measurement prepared by the Burgh Engineer, from whom schedules of quantities and all particulars may be obtained. Sealed offers, marked outside "Tender for Convenience, Holyrood,' must be lodged with T. Hunter, W.S., town clerk, City Chambers Edinburgh, not later than Oct. 15.

Oct. 15. Monaghan. *Repairs of two labourer's cottages* in Mullan and one in Cornanure. Specification of the work to be done can be had on application to clerk. Tender must be lodged with S. Mitchell, clerk to the Council, Boardroom, Workhouse, Monaghan, or dropped into the tender box in Workhouse, before 12 o'clock noon on Oct. 15. Tenderers to name two solvent sureties willing to enter into a bond for the due perfection of said repairs.

October 18. Harrogate. *Private street works* required in back roads on south west side of West End Avenue for the Harrogate Corporation. The specification may be seen and quantities obtained of F. Bagshaw, borough engineer and surveyor. Tenders must be submitted not later than 9 o'clock a.m. on Oct. 18.

Oct. 19. Elgin. *Erection of a double cottage* in Grant Street. Plans and specifications may be seen with C. C. Doig, architect, 147, High Street, Elgin, and offers lodged with him on or before Oct. 19.

Oct. 20. Bournemouth.—*Erection of caddies' shelter and master's office*, for Queen's Park Golf Links, and other works in connection therewith. Full particulars, forms of tender and specification can be obtained of the Borough Engineer, F. W. Lacey, at whose office drawings can be seen, provided that the sum of £2 2s. has been previously deposited with F. W. Lacey, M.Inst.C.E., borough engineer and surveyor, Municipal Offices, Bournemouth. Tenders to be sent in in envelopes provided for the purpose, to G. W. Bailey, town clerk, before noon of Oct. 20.

Oct. 23. Bargoed.—*Erection of underground public convenience*, consisting of four urinal stalls, water-closet, lavatory fittings, &c., near the entrance to the Rhymney Railway Station at Bargoed, in the parish of Gelligaer. Plans and specification may be seen, and bills of quantities obtained, upon application to P. Jones, F.I.S.E., Council's engineer and surveyor, Council Offices, Hengoed, *via* Cardiff. Sealed tenders, endorsed "Public Convenience, Bargoed," to be delivered to F. T. James, clerk, 134, High Street, Merthyr Tydfil, on or before Oct. 23.

Oct. 23. Selby.—*Erection of cottage, office, and boundary wall*, at the New Waterworks, Brayton Barff, Selby, for the U.D.C. The drawings and specifications can be seen at the offices of Percy Griffith, M.Inst.C.E., engineer, 54, Parliament Street, Westminster, S.W., and Bruce McG. Gray, A.M.Inst.C.E., engineer, Council Offices, Selby, and forms of tender and bill of quantities may be obtained on payment of a deposit of £1 1s. Sealed tenders endorsed "Cottage, etc.," to be delivered to J. H. Bantoft, clerk to the Council, Council Offices, Selby, not later than 12 noon on Oct. 23.

Oct. 24. Bradford.—*Additions to the national schools*, Thornton, Bradford. Plans, &c., may be seen and quantities obtained of S. Spencer, architect, &c., Old Bank Chambers. Great Horton, Bradford. Tenders must be in by Oct. 24.

Electrical Notes.

Modern Electric-Light Fittings.

Owing to the growth of artistic taste few householders are content to have the lighting arrangements of their homes carried out in the perfunctory manner which formerly used to be considered good enough. Then the gas fitting reigned supreme, and where electricity had obtained a precarious footing it was supplied to lamps fixed in brackets or pendants modelled on the lines of the gas pipe, if not that abomination known as the converted gas bracket. The electric-light fitting of the early nineties was crude. Fittings were frequently long bare rods, or cords with ugly globes depending from them. Of late years, however, the improvement of taste has spread to the electrical metal workers, and following the example of the Edison and Swan United Electric Light Co., Ltd., of 36-37, Queen Street (who were, we believe, the first firm to turn their attention to artistic electrical fittings), many makers now strive to bring their designs more into line with modern requirements. The price lists and leaflets issued from time to time by the Ediswan firm have always been full of good designs, and in the new edition of their fittings catalogue, Section VI., the same qualities are evident; obsolete and inartistic designs being eliminated, and illustrations given of a large number of excellent pendants, standards and electroliers to suit every style of decoration. Worthy of particular attention are the new Flemish designs of electroliers, with brackets in keeping. These are in polished brass, with ornamental chain and back-plate, and are fitted with the "Huntalite" candle lamp. Very popular also should be the "Adam" type standards, finished in imitation gilt, although we note that any other finish can be obtained to order. The "Empire" and Louis XVI. type of French standards, in bronze and gilt, are also attractive, while in ceiling fittings we find every type fully illustrated, from the massive 6-light fitting with long trumpet shades to the dainty copper tulip fixture, eminently suitable for low rooms. Architects will find it useful to have this catalogue on their shelf.

ELECTRIC PENDANT BY EDISON AND SWAN CO.

Life of Lamps.

It is curious how few people trouble to understand the essentials that go to make a perfect electric lamp. They will minutely check their lighting bills, but few appreciate the relation between the lamps they use and the cost of lighting. Either they buy a certain lamp simply because it is cheap, largely advertised, or else they buy a good lamp and use it until the bulb is absolutely black. Now, although many lamps have a long life, it is not economical to burn even the best for more than about 8,000 hours. It is interesting to note that, according to reliable figures, lamps should be changed as follows :—

Lamps	installed in	January,	change in	June.
,,	,,	February	,,	August.
,,	,,	March	,,	September.
,,	,,	April	,,	October.
,,	,,	May	,,	November.
,,	,,	June	,,	November.
,,	,,	July	,,	December.
,,	,,	August	,,	December.
,,	,,	November	,,	February.
,,	,,	December	,,	April.

In this way the careful householder will find a substantial increase in the efficiency of his lighting, coupled with a reduction in his lighting account.

CONCRETE AND STEEL SUPPLEMENT (MONTHLY).

THE FINISHING OF CONCRETE FLOORS.

Now that concrete floors are so much in vogue, by reason of their fire-resistance and economy of construction for sustaining heavy loads, it becomes a matter of anxious consideration to the architect to know how to finish the surface of such floors. There are several systems open for adoption.

The surface can be finished smooth with the trowel in concrete itself, for instance. It is true this will form an impervious surface, but ordinary aggregates do not wear well under much traffic, and such a surface is somewhat slippery. Consequently where such a method is adopted it has been customary to finish the top with a richer mixture of concrete than the under portion of the floor, and to use aggregates that resist wear—such as granite chippings, broken spar, and marble chips. The last mentioned (marble) constitutes the well-known terrazzo flooring, which gives a much better appearance to the floor surface than either of the other aggregates. The small broken pieces of marble which are placed on the surface of the floor are of course rubbed down until there is very little of the cement matrix to be seen, and the floor is finally polished.

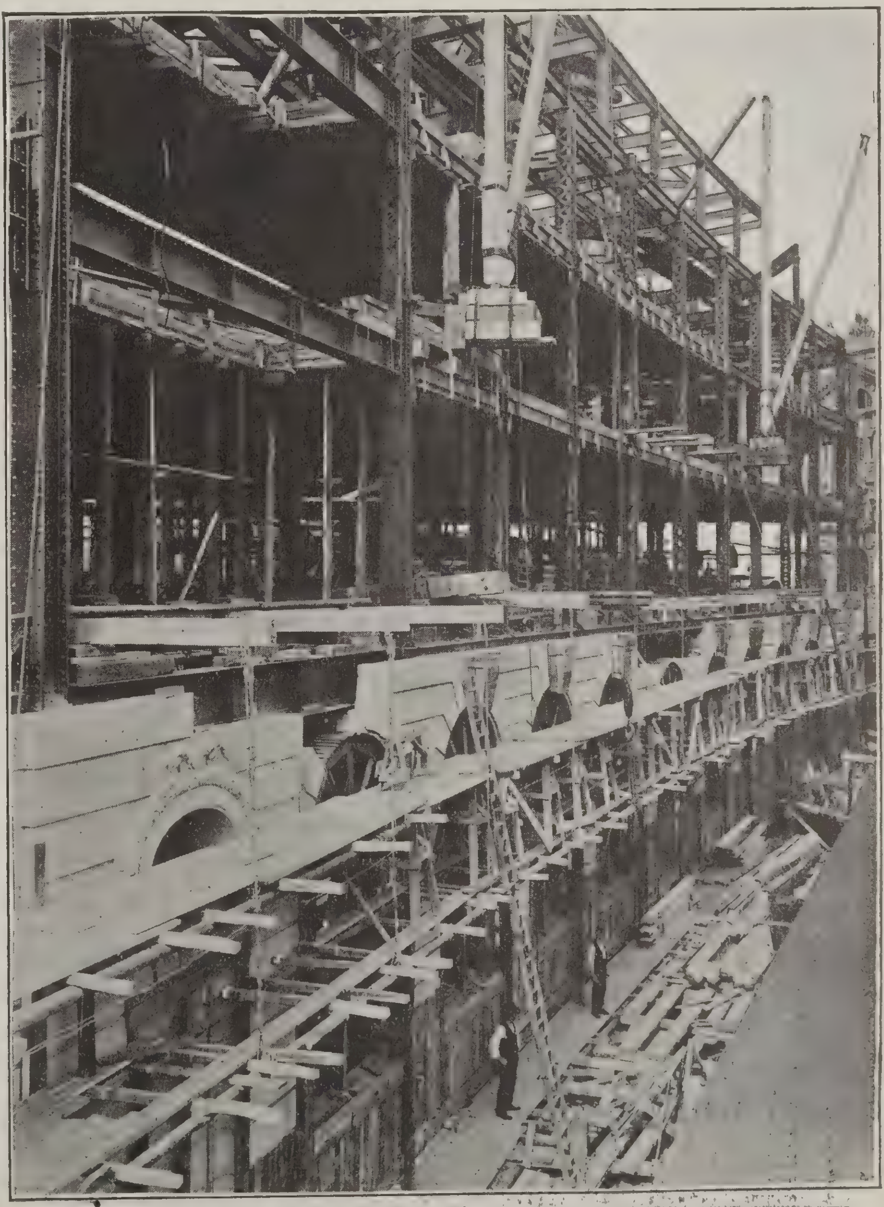
Such floors, however, are cold: hence another method has been largely adopted—namely, the use of a special magnesian or other strong cement (whose setting is not affected by the use of organic material and finely powdered matter which may be added to colour the coating) with aggregates such as sawdust, shavings, and straw. These cements and admixtures of cement and aggregates are known under various fancy names. They form impervious and clean surfaces which add to the value of the flooring where hygiene is of first importance, and also where the floor may be subjected to liquids, such as in bathrooms, lavatories, hospitals, warehouses, and offices. Although such floors are warmer than concrete or terrazzo floors, they take an intermediate position between these and the third method of finishing floors—namely, to use wood in some form.

Of the third method the most elementary form is to use plain boards nailed either direct to wooden or breeze-concrete fillets let into, or raised above, the main body of the concrete. The latter is, perhaps, preferable, as giving a certain amount of spring to the floor and being drier, but if the boards are laid direct upon the concrete, depth is economised and no room is given for vermin or dirt and microbes; the boards, however, require tarring on the underside or need to be laid upon a bitumen coating, in order to prevent the moisture getting through into the concrete, or moisture penetrating from the concrete into the boards and causing the troublesome expansion and contraction, which will be referred to more fully in the case of wood blocks. Parquetry is applied to boarded floors as a rule, but it might be placed upon floors treated as in the second method. It is decorative, but would obviously be adopted in but few situations.

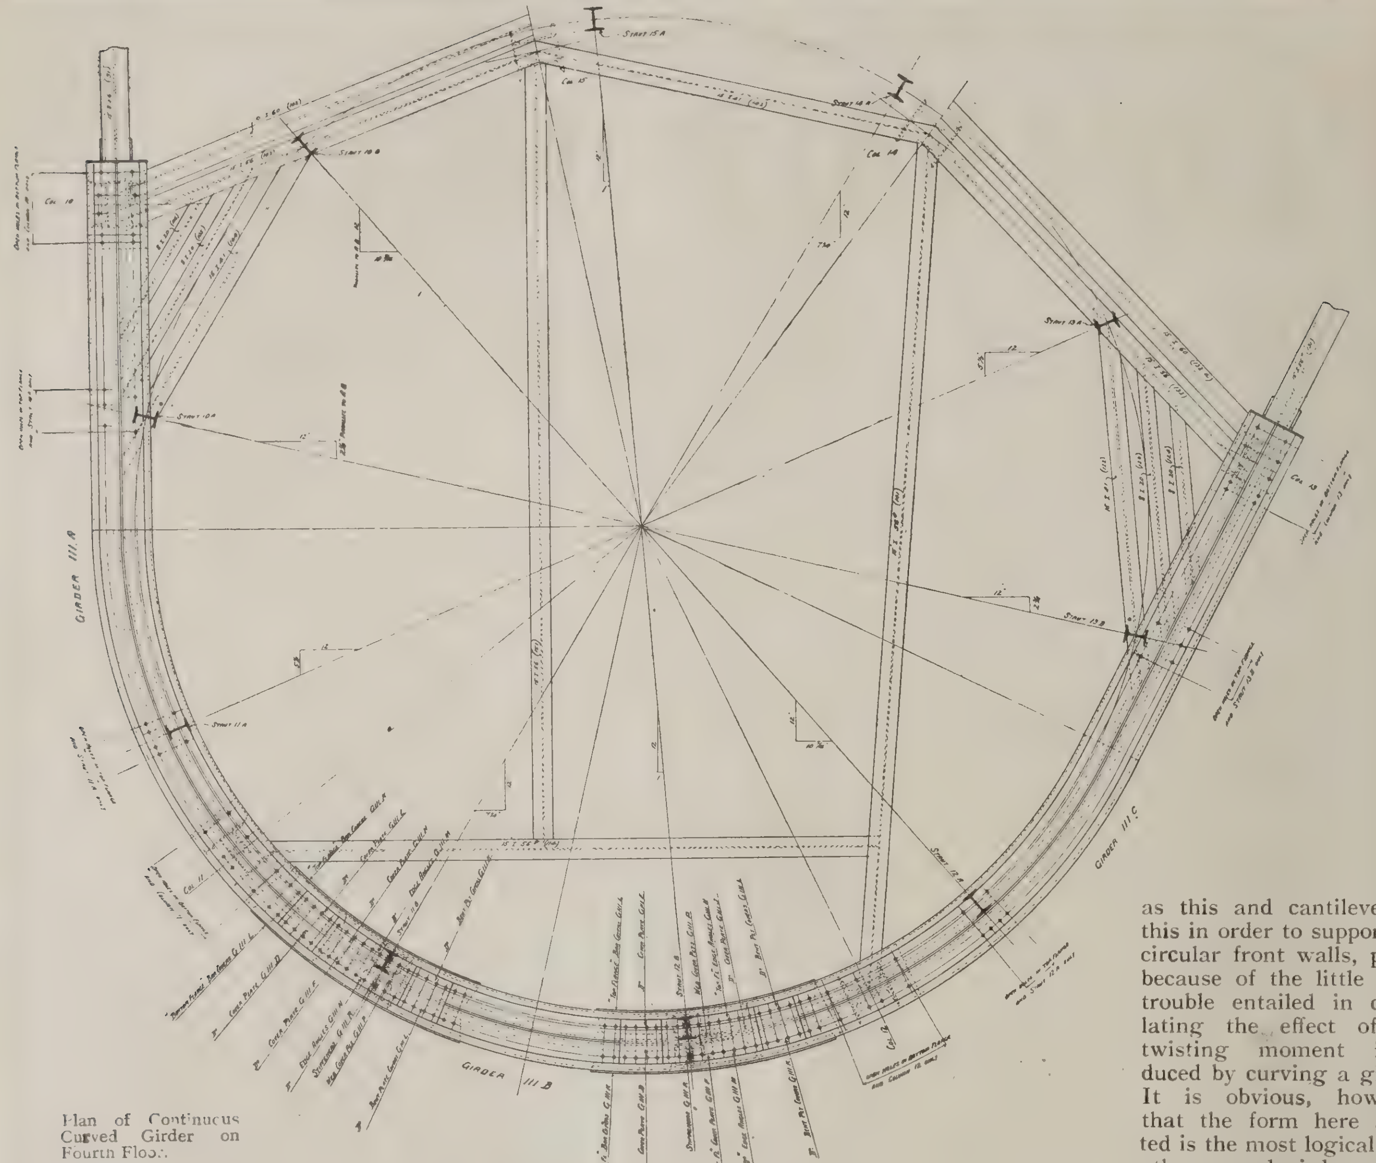
We now come to wood blocks as a subdivision of our third method. This is a flooring very largely adopted. Of course wood blocks have joints, but they are hygienic in so far that they can be kept clean easily. The trouble, however, with wood-block floors is that they are absorptive of moisture and, consequently, are subject to warping, expansion and contraction, resulting in bulging, opening at joints and uneven wear. Various devices have been adopted to meet this difficulty, among which may be mentioned the use of dowels, or wooden and metal pins or nails. The blocks are also laid on a tar or pitch coating. This prevents the ill-effects of moisture to some extent, but if the joints open so as to let water get in and thoroughly saturate the blocks they will expand, and, wedging themselves against the walls, will bulge up.

THE "MORNING POST" BUILDING.

In our "Concrete and Steel Supplements" for May 23rd and June 20th last we published photographs showing the construction of the new "Morning Post" building in Aldwych, London. We now give further views showing the steel frame practically completed, and the erection of the granite facing round the steel work, together with two detail drawings of a novel and interesting piece of girder construction at the fourth floor level. The plan shows the complete girder, which will be seen is curved, but the sectional plans and elevation relate only to the right-hand portion of the girder, which has been made in three parts. It is customary to place a straight girder across a curved corner such



NEW "MORNING POST" BUILDING, LONDON: VIEW SHOWING GRANITE FACING TO STEEL FRAME ON ALDWYCH FRONT. MEWES AND DAVIS, ARCHITECTS.



Plan of Continuous Curved Girder on Fourth Floor.

as this and cantilever on this in order to support the circular front walls, partly because of the little extra trouble entailed in calculating the effect of the twisting moment introduced by curving a girder. It is obvious, however, that the form here adopted is the most logical. The other curved girders which have been used in the construction of this building are of the ordinary plate form, as the loads to be sustained were comparatively light, consisting in each case of the construction of a single storey only. On the Strand corner of the building, however, at the fourth floor level, there is a dome, as will be seen from the general view. The girder here has consequently to sustain not only the floor above, but the dome construction as well, and the stresses become so excessive that angles had to be riveted upon the ordinary flanges. The granite work has been worked in Norway, and is being executed by Messrs. A. & F. Manuelle, Ltd.

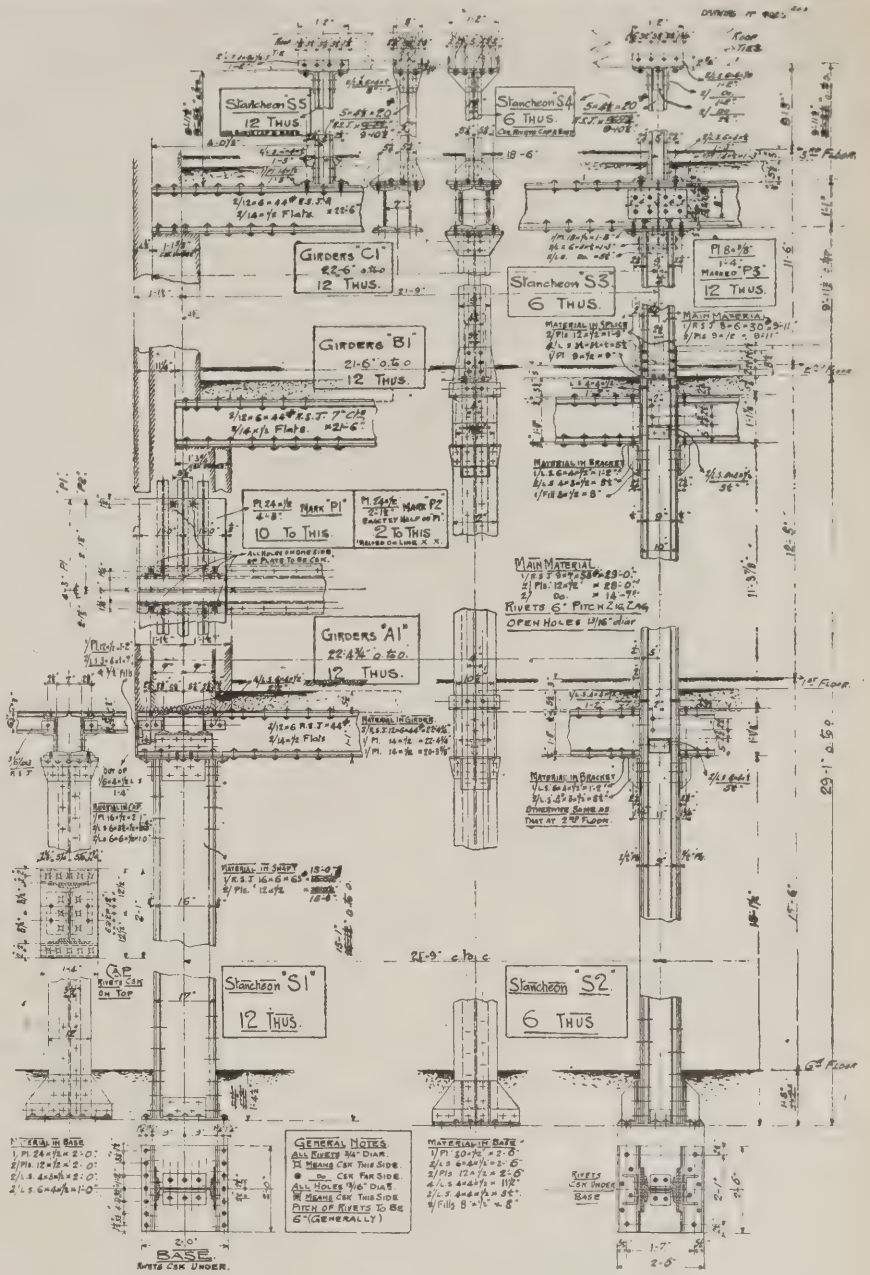
NEW PRINTING WORKS AT AYLESBURY.

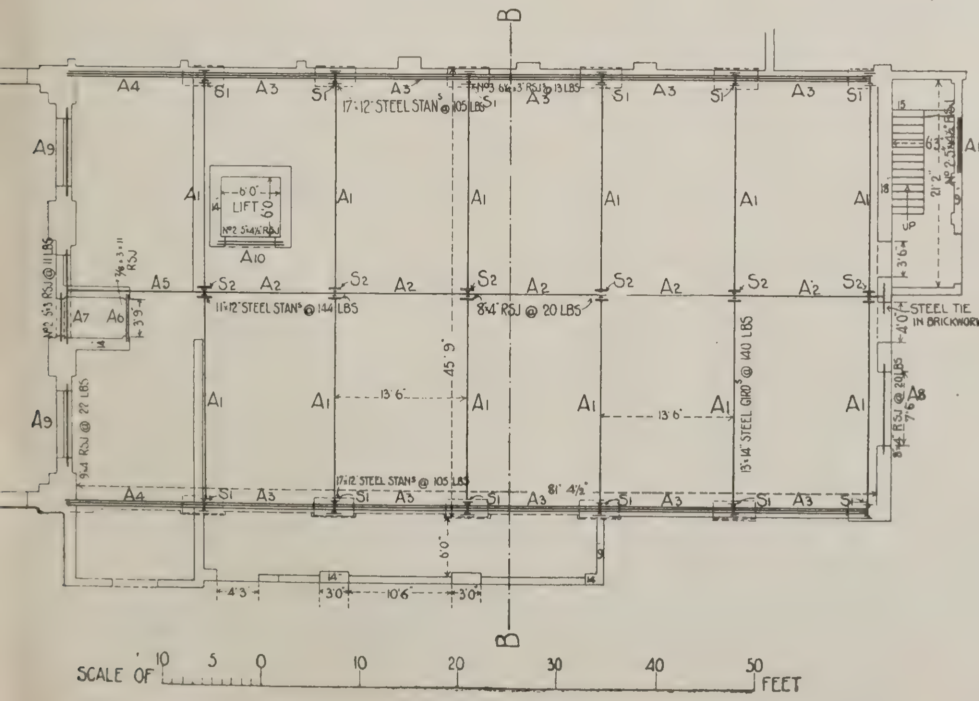
An Example of Rapid Construction.

The building illustrated by the accompanying drawings and photographs has just been completed for Messrs. Hazell, Watson & Viney, Ltd., and forms an extension of their printing works at Aylesbury. Mr. W. Ernest Hazell, A.R.I.B.A., of 5, Tavistock Square, London, is the architect. No time was lost during the erection, as will be seen by comparing the progress made with the dates of each view. The building was occupied about ten days before the final photograph was taken, on August 9th, the photographing of the finished elevation having been postponed pending the removal of some scaffolding which was needed for the erection of a crane, and which hid a portion of the building from view. Owing to surrounding buildings, the final photograph does not show the ground floor of the new extension. The ground floor is constructed entirely with steel stanchions, so spaced as to allow extensions on three sides when necessary, the bays between the stanchions being filled with wrought-iron sashes and light dwarf walls, easily removable.

All the floors are of reinforced concrete, constructed by the Patent Impervious Stone Co.; while the constructional steel work has been carried out by Messrs. Power's & Deane Ransome's, Ltd. The loads on the floors of the building being of an impulsive character, a greater margin of strength in the steel construction was allowed for than is usually adopted in the warehouse class of buildings. In the calculations the concentrated and vibrating loads were resolved into their equivalent dead loads. The centre stanchions were made in one piece from the ground to second-floor level, the inner plates ending at the centre of the second-floor girder, and the outer ones behind the brackets supporting the first-floor girders. This arrangement rendered the work of erection much more speedy, as only half the number of movements of the derrick pole were required, besides which the connections at the first-floor level were simplified.



DETAILS OF STEELWORK, BY POWER'S AND DEANE RANSOME'S, LTD.



Ground-Floor Plan.

NEW PRINTING WORKS, AYLESBURY. W. ERNEST HAZELL, A.R.I.B.A., ARCHITECT.

Owing to the small section of the stanchions supporting the roof above the third floor, the stanchions supporting that floor were not treated in the same manner, but terminated with a cap upon which the girders butted, and were fish-plated together. The base of the small stanchions were bolted to these girders, and formed an additional connection for the abutting girders they rested upon.

At the sides the large stanchions were only used as far as the first-floor level, above which the brickwork commenced, being built upon three small I sections.

The details were designed with a view to having only rivets in vertical shear, bolts being used to hold the girders in position on the brackets.

Local red bricks, with Impervious Stone dressing, have been used for the elevations and Broomhall tiles for the roofs.

A goods lift and crane, electrically driven, have been erected by Messrs. A. W. Penrose & Co., Ltd.; high-pressure gas has been installed by Messrs. James Keith & Blackman Co., Ltd.; and steam heating by Messrs. Rosser & Russell, Ltd. The general contractors were Messrs. Sabey & Son, Ltd.

ANNEXE, "DUNDEE COURIER" BUILDING, DUNDEE. WORKING DRAWING No. 4a, SHOWING REINFORCEMENT OF PRESS-PIT, BEAMS, STOOLING BEAMS, FLOORS, &c., ON GROUND FLOOR. CONSTRUCTED IN REINFORCED CONCRETE BY STUART'S GRANOLITHIC STONE CO., LTD. E. P. WELLS, ENGINEER. NIVEN AND WIGGLESWORTH, ARCHITECTS.

A REINFORCED CONCRETE NEWSPAPER OFFICE.

In the issues of our "Concrete and Steel Supplement" for May 23rd and June 20th last we published several of the working drawings for the reinforced concrete construction of the annexe to the "Dundee Courier" building erected in Dundee. These were as follows :—

No. 1. Framing plan of basement.
,, 2. Framing plan of ground floor.
,, 3. Details of ground floor beams.
,, 5. Framing plan of first floor.
,, 6. Details of first floor beams, &c.

We now publish further working drawings of this important example of construction, namely :—

Nos. 4 and 4a. Details of the press-pit, beams, stooling-beams, floors, &c.

Working drawings Nos. 4 and 4a are details of a particularly complicated piece of construction on the ground floor, the difficulty of which rendered it necessary to detail to a larger scale than the framing plans, and to show the setting-out and varying levels of the concrete work on one drawing and the reinforcing rods on another, for the sake of clearness. The floors of the press-pits and beams, as will be seen from these drawings, are of reinforced concrete, and they have to carry all the bearing blocks, pulleys, &c., for driving the three Goss printing presses which are here situated. The three gas-engines, two of 112-h.p. and one of 80-h.p., which drive the dynamos and printing presses, are situated in the basement, as shown upon the plan of that floor. The whole of the floors, as well as the roof, are calculated on the basis of an inclusive load of $2\frac{1}{2}$cwts. per sq. ft., the factor of safety being 4, excluding the concrete. The work was designed by Mr. E. P. Wells, who made use, where necessary, of his patent system of twin rods, consisting of two round rods united together by a diaphragm, split at the points of contraflexure, so that the top rod can be cranked up; the diaphragm is also punched with holes to allow the insertion of indented hoop-iron hangers.

The position of this annexe is shown on the ground-plan of the entire building, which was published, together with a perspective in our issue for May 24th, 1905. The general contractor was Mr. Stocks, of Dundee. The architects were Messrs. Niven & Wigglesworth, of 104, High Holborn, London. The contractors for the reinforced concrete work were Messrs. Stuart's Granolithic Stone Co., Ltd.

We have illustrated this building thus fully because, firstly, it shows the manner in which working drawings for reinforced concrete work are detailed as designed by a well-known English engineer; and, secondly, because it is interesting as an example of a building constructed completely in reinforced concrete, deserving careful study as embodying many features of constructive interest.

REINFORCED CONCRETE SYSTEMS.

VI.—Homan & Rodgers' System.

Although it is only comparatively a few years since Messrs. Homan & Rodgers introduced their type of reinforced concrete floor, this well-known firm have been intimately connected with the progress and development of concrete and steel construction from its earliest beginnings in this country; and their latest system must be viewed, therefore, not merely as a new one, but as a result of a great many years' experience, and a solution of many of the problems embodied in modern building construction. In using the words "concrete and steel construction" above, we do not mean them to be confined to the narrow limitation of reinforced concrete. We use them to cover the many-sided work of this firm in the use of steel in buildings, either as joists supported on walls (stanchions being used occasionally to add strength where space was too confined for a pier), steel roof trusses (of which Fig. 1 is an example), &c., in the partial system still general, and to within the last year or two exclusively adopted in building contracts in this country; and, finally, the complete steel skeleton-frame construction which Messrs. Homan and Rodgers were the first to advocate the advisability of introducing in order to satisfy certain conditions as a result of their study of American buildings.

Going back to the early history of the firm, its founder, Mr. Julius Homan, took out a patent in the year 1865 for the combination of rolled iron joists and plates to form combined girders. Although the idea met with a good deal of opposition at the time, it has been generally adopted, as we know now, and such built-up girders are used in place of the old type of girders formed with plates and angles. About this time, too, Mr. Julius Homan constructed concrete floors by laying small **T**-irons on the lower flanges of the joists, spaced 3ft. apart, and filling up with Portland cement concrete. This system of using **T**-irons is deserving of special note in connection with the latest system introduced by the firm, which we shall deal with later on in this article.

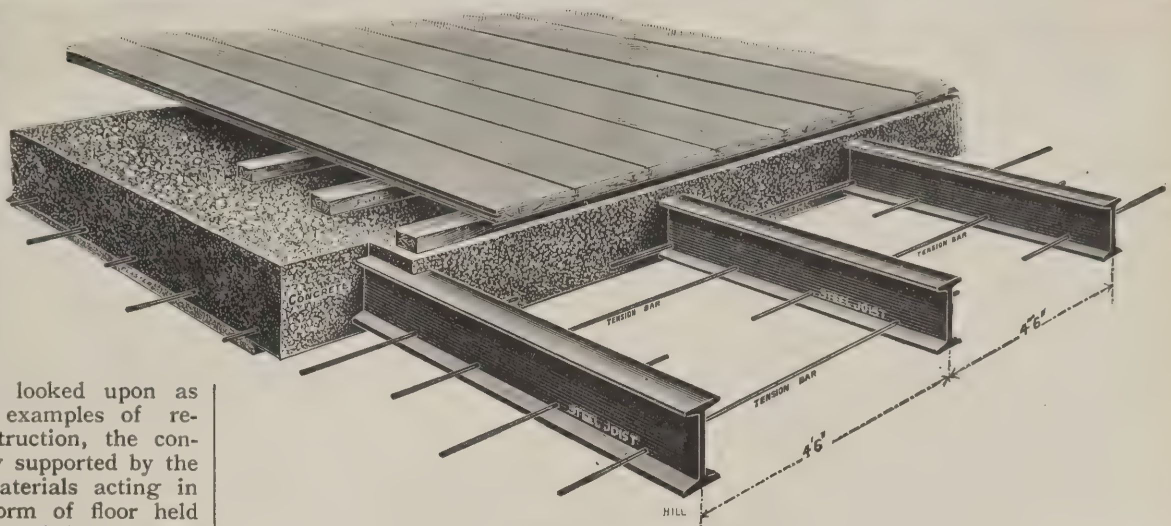

FIG. 3. INTERMEDIATE TYPE OF REINFORCED CONCRETE FLOOR.

In the early seventies Messrs. Homan and Rogers adopted the plan of using light iron joists about 3ins. deep, placed 1ft. apart, and bedded in concrete 6ins. thick. In this system the concrete was relied upon to take up the whole of the compressive stresses, while the small joists acted merely as tension members. Consequently, this may be looked upon as one of the earliest examples of reinforced concrete construction, the concrete not being entirely supported by the joists, but the two materials acting in combination. This form of floor held its own for many years, and the firm used it in more than 2,000 buildings.

As fire-resisting floors these gave very good results, for, in a great fire which occurred in 1861 at Messrs. Lorsont's leathercloth works, at North Woolwich, one of these floors resisted for some days the burning of the stock of oils, varnishes and other inflammable materials, and, in addition, withstood the falling walls and masses of masonry, saving intact the offices and warehouses, with a valuable stock of goods. A fire-proof floor at the Bradford Theatre, on the latter system, not only saved the music-hall built underneath from the fire of August, 1878, but actually resisted, without damage, the fall of the proscenium girder, weighing nearly seven tons, as well as the collapse of the heavy stone walls, the iron roof principals and the roof covering—in fact, the whole of the superstructure. At the Brighton Concert Hall, destroyed by fire in October, 1882, the fire-proof floor, on this system, received the whole of the debris from the superstructure, and saved the wines stored beneath—not a bottle being broken. A good many similar instances might be cited, but it will be sufficient to state briefly that on every occasion where these floors have been subjected to the test of a fire they have stood and arrested its further progress.

In the year 1885 Mr. Julius Homan took out his first patent for brick floors, which form of floor was constructed by him more than three years before any similar floor was introduced. Such floors possess the advantage of dispensing with the usual timber centering, and, consequently, can be very rapidly executed; this can also be used for repairing or renewing a floor where the compartments below must remain undisturbed and undamaged by falling materials or the dripping of water used in mixing concrete. When finished, the ceilings present an unbroken sheet of fireclay to any flames that may attack the floor from below. The construction of this floor is as follows:—Solid rolled steel joists are placed 1ft. 6ins. apart on the walls or main girders. These joists vary in section from 4ins. deep to 10ins. deep, according to the span. Between them, supported on the lower flange, are laid hollow bricks made from fireclay, and the concrete filled in to a total depth of not less than 6ins. The strength of this combination is remarkable, resulting from the fact that the whole of the tensive streses, the resulting strength whilst the concrete resists the compressive stresses, the resulting strength being in some cases 50 per cent. in excess of any calculation based on the transverse strength of the steel joists taken alone—consequently effecting a saving in the amount of steel. Being a flat floor there is no thrust, but the walls are securely tied together. Many failures in great fires have been due to the use of arched systems of floors thrusting out the walls. In all arches there is thrust,

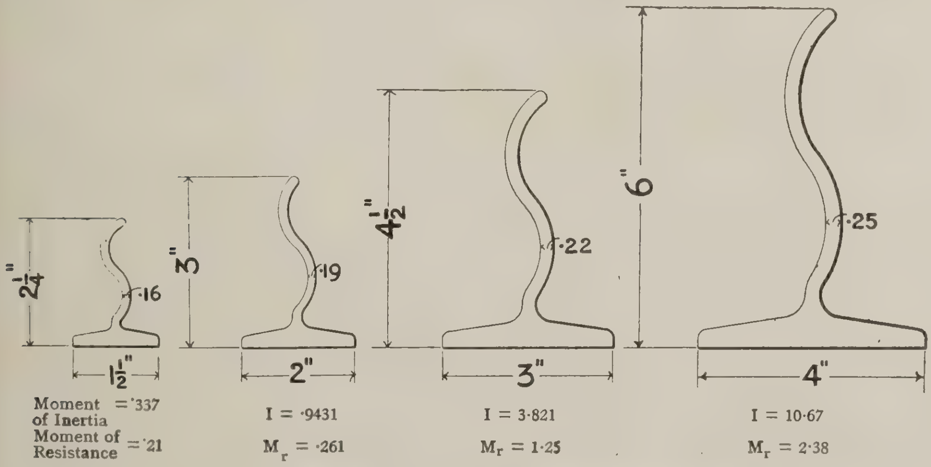

FIG. 4. SECTION OF WAVED-TEE REINFORCING BARS.

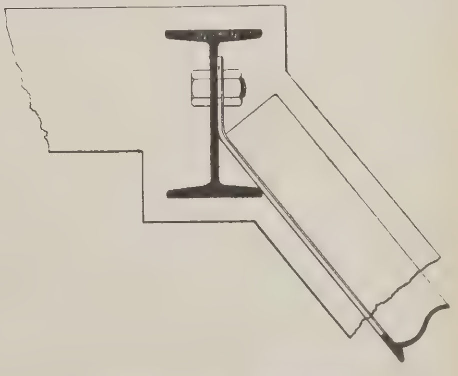

FIG. 6. CONNECTION FOR MANSARD ROOF CONSTRUCTION.

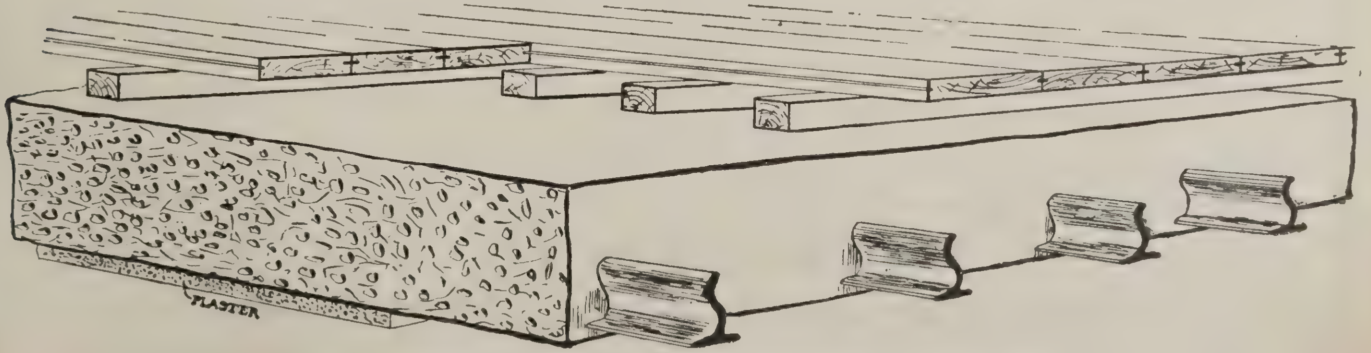

FIG. 5. PERSPECTIVE VIEW OF WAVED-TEE REINFORCED CONCRETE FLOOR.

and the flatter the arch the greater the thrust. Fig. 2 shows one of Messrs. Homan & Rodgers' hollow brick floors in course of construction at a block of workmen's dwellings erected by the Guinness Trust, in Brady Street, Borough, S.E.

An Intermediate System.

Such work as referred to above is reinforced concrete of a kind, but the tendency of recent years has been towards reducing the amount of steel; and firstly we may deal with the type of reinforced concrete floor used until recently by Messrs. Homan and Rodgers in a great many buildings. This is shown in Fig. 3. It will be seen that steel joists are used at 4-ft. 6-in. centres, the webs being pierced with holes through which steel tension rods are inserted. These tension rods, it will be observed, are in short lengths, sufficiently long to leave about 1ft. 6ins. projecting on the outsides of the joists so as to give a good bond into the concrete of the next bay. The rods are placed alternating, as shown. Such a form of floor is cheap.

Views on Reinforced Concrete.

In Messrs. Homan and Rodgers' view, reinforced concrete construction furnishes very favourable results when carefully executed; but there is considerable risk of a failure if left to the ordinary workman, on account of the trouble of placing the rods in their correct position. Another objection is the length of time required for the concrete to become thoroughly set before the centering can be removed, because the stability of the floor, without any regard to the load it will be called upon eventually to sustain, depends upon the strength of the concrete. This entails either very slow progress of the work or great expense in providing sufficient centering to enable the work to be carried out with reasonable speed. Architects often raise the objection that, in the event of any defect in the concrete, a collapse of the whole structure is likely to occur. A further drawback suggested is the great depth required in long spans, though this is met to a great extent by top reinforcement. The fact, of course, is that there are many sides to the question of reinforced concrete construction. Economy is effected by various considerations, one of the most important being that of centering; another, surety that the reinforcement shall be in its proper position when executed by unskilled labour, and, as a corollary, the saving of expense in supervision; thirdly, the desirability of a simple—indeed, almost rough and ready —system of construction so as to economise labour and guard against error.

The Latest System.

It was with a view to reducing the steel to the minimum amount, and yet meeting such objections and defects, that Messrs. Homan and Rodgers brought out a few months ago the waved-tee type of floor. The section of the reinforcing bars in this system are as shown in Fig. 4. It will be seen therefrom that four sections are adopted. The tensile stresses are taken by the steel bars, while their special form obviously prevents them being drawn out or parting from the concrete, at the same time giving them sufficient rigidity to support the concrete and allow the centering to be removed much sooner than when rods only are used. The waving of the web considerably increases the transverse strength of these bars, as will be seen from the comparison of their moment of inertia with that of a similar tee section with a straight web; but the waving of the web, as above stated, binds into the concrete and takes up shearing stresses. The web is thin, so that the bulk of the metal is placed in the most economical position—namely, as near the underside as possible.

The firm claim that this floor is the most economical on the market, and they are prepared to furnish estimates either for the construction of floors alone, or to include the main girders and other constructional steelwork.

How Constructed.

The perspective view (Fig. 5) shows the manner in which a floor is constructed on this system. There is no special connection needed between the tees and the beams, but if it is desired to tie the latter together in any particular circumstance, tie-rods are introduced, bolted through the webs of the main beams; or the tees are notched so as to enable them to be riveted to the main beams.

A Roof Detail.

Fire-resisting roofs are now required in a good many buildings, especially in London, to meet the requirements of the Building Act. The way in which Messrs. Homan & Rodgers conform to the necessity of attaching their bars in the construction of a Mansard roof is illustrated in Fig. 6. It will be seen that this is a very simple system, and yet admirably effective.

Calculations

With regard to the calculations for members with reinforcements of this special shape, being of large section, the usual formulae as applied to rods of small section have to be somewhat modified; but it is out of place for us here to enter into detail. The modifications have been dealt with in various books on the subject, and those with a special knowledge will be able to see the advantages which the waved-tee bars offer. Messrs. Homan & Rodgers use the $2\frac{1}{4}$-in. by $1\frac{1}{2}$-in bars for spans up to 8ft., spacing the tees 1ft. 6ins. apart. The next size, 3ins. by 12ins., they use for spans up to 10ft., spaced 1ft. 6ins. apart for the maximum distance, or wider apart for shorter spans. The two larger sections are used for heavy loads and long spans. We would call attention here to the advantages which tee bars offer in the design and construction of reinforced concrete chimneys and arched bridges. This new waved section should be specially noted by designers of this class of work.

Aggregates and Cement.

In regard to other matters in the practical construction of concrete and steel floors, Messrs. Homan & Rodgers have investigated all branches of the subject for many years past, and it will be of interest to record some of the results of their experience :—

In their opinion the best aggregate for concrete floors is broken firebrick, pottery, brick, or similar material. Although the first cost is considerable, the strength of the concrete is very much greater than when made with clinker, ash or coke breeze. These latter aggregates, moreover, are open to the very serious objection that any material containing sulphur has a most deleterious effect upon cement, frequently causing the concrete to expand and irretrievably damaging the building in which it is used.

With regard to cements and their suitability for the construction of reinforced concrete, they consider that they should be absolutely free from uncombined lime, fit for immediate use when delivered, and should pass the following tests (the temperature of the room where the tests are made being kept between 60° and 65° Fahr.):—

The specific gravity of the cement when delivered to be not less than 3. The weight of the litre of cement to be not more than 1,050 grammes.

The tests for fineness of grinding to be made upon samples weighing 100 grammes. Siftings to be done through standard sieves of

76 by 76=5,776 meshes per sq, inch.
180 by 180=32,400 „ „ „ „

All must pass through the 76 by 76 sieve and the residue must not be more than 14 per cent. on the 180 by 180 mesh sieve.

Setting.—600 grammes weight of cement to be spread out in crater form on glass; into the centre of the crater thus formed, pour all at once 25 per cent. of drinking water (150 cubic centimetres), The mixture to be well worked with a trowel for five minutes reckoned from the time of pouring in the water. With a portion of the paste thus obtained, fill a mould in the shape of a truncated cone 8 centimetres diameter at the base, 9 centimetres diameter at the top, and 4 centimetres deep, the surface of the cement to be smoothed with a trowel. Immediately the surface of the cement is smooth, the mould containing the cement is to be immersed in a bath containing water, of which the temperature is to be kept between 60° and 65° Fahr. The box is to be taken out of the bath only during the time necessary to make the test.

For the setting test a Vicat needle to be used having a smooth, flat, square end, one millimetre square and weighing 300 grammes. The cement will be considered as set when the needle does not appreciably penetrate it. The time for setting to be reckoned from the moment that the water for mixing the cement comes in contact with it. If the cement sets under the above conditions in less than three hours the cement will be rejected. It will also be rejected if it does not set within twelve hours.

Cold Test for Change of Shape.—Immediately after the mould has been filled for testing the setting, part of the same gauging is to be placed on glass in circular pats about $1\frac{1}{2}$ centimetres thick in the centre and with thin edges. Directly the pats are made, the plates of glass and the pats upon them are to be placed in drinking water of which the temperature is kept between 60° and 65° Fahr If any cracks or fissures appear in the pats or if the edges of the pats are raised and detached from the glass the cement will be rejected.

There are other tests, to which Messrs. Homan & Rodgers submit their cement from time to time, such as the hot-test for change of shape, tensile strength, &c.; but the tests set out in detail, as above, are extremely important.

Buildings Executed.

Among the many important buildings in which Messrs. Homan & Rodgers have recently erected floors, we have only space to mention the King's Sanatorium, the Ecclesiastical Commissioners' new offices, the new building for the Liverpool, London & Globe Insurance Co. in Cornhill, E.C., and Shoreditch Town Hall. We give below a list of buildings, the floors of which are executed or in progress by Messrs. Homan & Rodgers, of Manchester, on the new waved-tee system, from which it will be seen good progress has been made, although the system was only introduced such a short time ago.

SCHOOLS.—Letherland; Levenshulme; Hill Top; Burslem; Draylsden; Brunswick Council, Cambridge; Broomhall, Nantwich; Barnton, Northwich; Alvaston; Derby; Thatto Heath; cookery centre, St. Helens; school of art, Burslem; science school, Warwick.

HOTEL.—Holmbrook, Preston.

DRILL HALL.—Birkenhead.

WAREHOUSE.—Compton Mills, Leek.

MILL.—Borrowash, Derby.

CHURCHES.—Welsh C.M., Hammersmith; Congregational, Burslem.

OFFICES —Crown Street, Liverpool.

SAVINGS BANK.—Preston.

INFIRMARIES.—Workhouses at Atherstone, Clatterbridge, Boston, Coventry, Otley, Brentford.

WORKHOUSE.—Brentford.

MISCELLANEOUS.—Nurses' Home, Rotunda, Dublin; Rockside Hydro, Matlock; Summit Works, Walsall.

A Correction.—In the article entitled "Reinforced Concrete Sewers, Conduits, &c., built *in situ*," published in the "Concrete and Steel Supplement" to our issue for September 12th, an error occurred on p. 61. The paragraph near the bottom of the third column should read :—"If meshwork be used, it should be diamond shaped and laid so that the diagonals of the mesh run one with and the other at right angles to the periphery of the pipe, in which way a reinforcement of helical members crossing each other is obtained."

Age and Experience. THIS subject is a fruitful source of discussion among all sections of the community, and it will bear considerable thought on the part of members of the building trade and the architectural profession. It seems to be becoming an accepted doctrine among employers of labour that this is the age of young men, and many able craftsmen find themselves in want of employment when their knowledge has been matured and they still possess plenty of vigour and initiative. It is regrettable from every point of view that the abilities of craftsmen trained under the apprenticeship system (which has not yet been bettered) should be lost. We still need good work, notwithstanding the constant endeavour to rub along with the minimum of effort and to secure the maximum of outward show at the least cost. We need to recognise that the building craftsman is like other artists, such as painters and sculptors—theory is not everything; practice is also needed in his education. There is of course a tendency for age to stagnate a man's initiative, invention and energy, but this does not necessarily follow. There are any number of examples of men whose work when they have reached old age has the appearance of being produced in the full flower of manhood. A young man, of course, is not necessarily inexperienced. The foreman and clerk of works, because they do not favour new methods, are often replaced by younger men, but their experience is invaluable in routine. The fact that age need not mean stagnation should urge the worker to keep alert and the employer to judge a man on his merits.

The Ingenuous Building Act Committee. OUR readers will remember that, with the exception of Part VIII., relating to the means of escape in case of fire and the reduction of fire risk in buildings, the London Building Acts (Amendment) Bill of 1905 was withdrawn on the second reading, as the London County Council found the Bill met with such great opposition. In April, 1905, the Council did what it should have done before—it sent the City Corporation, the metropolitan borough councils, and other authorities and associations concerned, copies of a document showing the effect of the Bill on the existing Acts with a view to an amended Bill being introduced as soon as possible. The Building Acts Committee of the Council has had under consideration for some time the observations elicited in response to the Council's invitation, but it is now stated that, owing to the magnitude of the work, it will not be able to report in time for a complete Bill to be introduced in the next session of Parliament. Moreover, the Committee thinks that the experience gained in connection with the 1905 Bill shows conclusively that it would be very difficult, if not impossible, to pass in one session of Parliament a Bill dealing with the whole of the amendments required. We have never thought the Building Act Committee (nor the Council) particularly sensible in its dealings with this matter; both having betrayed a wonderful disregard for outside opinion, although they have asked for suggestions, possibly with the idea that they would thus be prepared to meet the points which might be raised in opposition. They have occasionally also displayed unseemly haste, and whoever has been responsible for the framing of the amended by-laws seems to have been oblivious to the real practical reforms needed, to have been influenced merely by a desire to smooth out certain points of difficulty in the interpretation of the existing Act, and generally to get Parliamentary sanction for the Council to make any by-laws it wishes from time to time. It seems to be considered diplomatic not to divulge all the details of the Council's real designs on the public, but the latter cannot be blamed if they assume such action to be underhand. If the Council is honest in intention and reasonable in desire, why should it be afraid to court the light of day? The detailed clauses ought to be inserted in the Bill. If logical, they must be admitted, but the public object to giving the Council *carte blanche* to do as it pleases with them. The same secrecy, want of consideration and unreasonableness seem to be still followed by the Committee. Notwithstanding the fact that the existing Act results in great inconvenience to the public and the architectural profession, and needlessly increases the cost of erecting buildings in London, the Committee calmly puts aside this larger question in order to push through two smaller matters which its officers, and the members of the Council, seem to set themselves against, because they detract from their authority and act as a check upon the Council for the benefit of the public. These two matters, the Building Acts Committee evidently thinks, are of foremost importance, because an amendment of the law is sought without further delay. The matters in question are the constitution of the Tribunal of Appeal and the remuneration of district surveyors. The Committee gives itself away when it states that, if a satisfactory amendment of the law in these two respects can be secured, it will greatly facilitate the work of formulating proposals with regard to the other necessary amendments. As an additional reason for urgency, the Committee refers to the fact that a considerable number of district surveyors' districts are now vacant, and that it is desirable that the temporary arrangements made for the supervision of these districts, in view of the possibility of securing at an early date legislation with regard to the mode of payment of district surveyors, should be terminated as soon as possible. It therefore proposes a Bill in the next session to amend the Building Acts in these particulars. The proposals are not new. They have already met with strong opposition from the architectural profession, who do not desire to see both the Tribunal of Appeal and the district surveyors dominated by the Council's wire-pullers. In such proposals the Council may expect to meet strenuous opposition in Parliament. The public need to be on the alert to see that they are not still further domineered over and interfered with by the red-tapeism of the London County Council.

R.I.B.A. EXAMINATIONS.

Model Answers by A. G. Bond, B.A., A.R.I.B.A.

(Continued from page 143, No. 607.)

The Final Examination.

Subject III.—THE NATURE AND PROPERTIES OF BUILDING MATERIALS.

[*Time of examination, one hour and a half. Maximum number of marks, 50.*]

(1.) Give a list of the different qualities of lime used for making mortar and the proportion in which each is mixed: state whether the proportions are measured before or after the lime is slaked. What difference in bulk does the slaking of each kind produce? What variation would you make in the proportions when a mortar mill was to be used?

The limes used for mortar are those which have the character of "hydraulicity." *Stone limes* possess this character in a small degree and will make a fair mortar for work above ground: they are used in the proportion of 1 of lime to 2 or 3 of sand: a well-known example is the grey stone or Merstham lime. *Hydraulic limes*—especially those from the "lias" formation, known as "blue" and "white"—are the best limes for mortar. For work below ground 1 of lime to 1 of sand is the usual proportion; for other work the quantity of sand may be doubled or trebled. Hydraulic limes are classed as "feebly," "moderately" and "eminently" hydraulic, according to their degree of hydraulicity: a well-known example is the Keynsham lime. *Selenitic lime* contains a varying proporportion of gypsum (a sulphate of lime), also called "selenite," which may be mixed with a larger proportion of sand without loss of strength (4 to 1 makes a strong mortar): it should be mixed in a mill where possible. The proportions given above are for the dry lime and sand before the former is slaked. Slaking is found to require about 1½ gallons for every bushel of lump lime (besides that required for mixing). This represents the consequent increase in bulk. The lime is heaped and carefully watered, and the measured quantity of sand put over it to keep in the heat and moisture. The time allowed for slaking depends on the nature of the lime: hydraulicity reduces and retards slaking. A mortar mill, by ensuring perfect grinding of the lime and perfect mixing of the ingredients, enables the proportion of sand carried by the lime to be made greater, about in the proportion of 4 to 3 as compared with hand mixing.

(2.) State the method of ascertaining the proportion of cement to aggregate in making reinforced concrete, and the reason why fineness improves the strength of cement. Describe briefly the process of making cement.

Theoretically there should be no voids or interstices in concrete, and this is especially important in the case of concrete used for upper floors and in conjunction with steel, &c. Hence the matrix should be of such proportion to the aggregate as to completely fill the interstices of the aggregate when dry. If the aggregate were all of larger size (the largest used in the cases referred to should not exceed ¾in.) it would be generally advisable to add sand in equal proportion to cement, but as a rule broken materials are used for aggregate and there is consequently sufficient sand or brickdust, &c., in the aggregate, so that sufficient neat cement should be allowed to fill the whole of the interstices. With regard to fineness of grinding, a tendency to expand when set is often due to free lime contained in the larger particles, which have practically no cementing power and, owing to their size, resist the slaking action of the air: fineness of grinding also helps the cement to penetrate the smallest interstices, and in this way increases its cementing value. Portland cement is made in two ways:—(i.) In the *wet* process chalk and clay are ground together in water (in varying proportion according to their composition), dried, burnt at high temperature, and ground to fine powder. (ii.) In the *dry* process the materials are ground, made into lumps with very little water, burnt, and ground fine as before.

3. Describe the methods of preparing the materials of which bricks are made, and the processes of wet (or slop) and dry (or Fletton) brickmaking. In what respect do the bricks produced by the two methods differ and which do you prefer, and why, and for what purposes?

The methods differ in different brickyards, and it sometimes happens that the clay can be used without preparation and artificial mixing, as, for instance, at Conyer, near Sittingbourne. Here the clay is dug and tipped into a pug-mill (mixed with a little coaldust for fuel) and passes thence direct to the moulding machine, then to a long drying chamber, through which the bricks pass slowly on a special truck, and afterwards to a tunnel-shaped kiln. In this case the whole process only occupies about five days, the result being "stock" bricks. In other cases several extra processes may be found necessary, as, for instance, sifting to get rid of stones, washing and grinding in a washmill in which the clay is churned by revolving beaters, and before moulding it may be partially dried and mixed with any desired element which is absent in the natural clay. In other cases the processes are varied, but with the same objects in view: for instance, they may be hand-moulded and be dried in "hacks" without artificial heat, and burnt in "clamps." In "slop"-moulding the mould is wetted to ensure the easy removal of the brick without damage. In dry moulding the mould is sanded for the same purpose. Flettons are manufactured from a deep bed found in the Peterborough district, and are machine-made and kiln-burnt. They show the fire mark very plainly, and for facing are therefore somewhat unsightly. The machine making causes them to be too smooth to form a good key for plaster, so that they are often moulded with grooved surfaces to give an artificial key: they are heavy owing to the absence of a "frog." The slop-moulding process is apt to cause surface cracks and the resulting bricks often lose their shape.

4. Give a list of the qualities which you would require in a building stone (a) for a public building in a manufacturing city and (b) for a country church.

It is presumed that internally the same qualities would be required in both cases. The following are qualities that may be looked for in a building stone to be used externally, disregarding the question of cost:—(i.) *Durability:* which may be, in the same stone, considerable in the country but almost nil in a town atmosphere: but it is a quality that would be essential in both cases and tests would be made suitable to the conditions which the stone is required to fulfil: non-porosity would be an important quality for use in the acid atmosphere of a manufacturing town. (ii.) *Strength:* Resistance to crushing is not usually of importance in a stone used for dressings, but owing to the greater height of town buildings it sometimes is of more importance here than in the less lofty country building; it may, however, have an importance in the case of isolated columns, &c., in a church. In neither case would resistance to friction be of importance, though on exposed coast situations blowing sand would have a disastrous effect on some stones. (iii.) *Good appearance:* This is a quality which would most probably be required in both cases. One must consider the situation of the stone and its use: for general walling a good hard rubble stone is frequently used in churches, but for a public building in a town ashlar work of good sandstone would probably be best; for dressings in either case one would require a freestone, the softer limestones being only suitable for country work.

[Note.—If time permitted the student could enlarge upon the above qualities by subdividing them, *e.g.*, the qualities which make for durability could be set out, hardness, toughness, homogeneity, crystalline structure, close and firm texture, and those which make for good appearance, such as colour, surface-texture.]

5. In a tabular form give a list of the different kinds of timber used in construction, arranged in order of strength. Give the purpose each is best suited for and the methods you adopt to see you get the qualities you specify.

The following is a selection of hard woods and pine woods in common use, in the order of their resistance to crushing. The crushing strength ranges approximately from 4 tons down to 2 tons per sq. in.

Hard Woods.		Pine Woods.	
Teak	3·8	Pitch Pine	2·9
English Oak	3·2	Memel	2·9
American White Oak	3·0	Fir...	2·5
Mahogany (Honduras)	2·8	Larch	2·5
Maple	2·7	Riga	2·3
		American Red Pine...	2·2

[Note.—The student would not of course be expected to remember the exact crushing weights; a general statement such as that given above would be sufficient.]

The best timbers for particular purposes may be given as follows:—For general constructive purposes the pines are all useful, and where great constructive strength is required oak, teak and pitch-pine, but not the last-named for cross-strain. For exceptionally dry situations the pines, except pitch-pine, and mahogany and sycamore. For use in water cedar, memel, elm, oak and teak. For street paving, jarrah. For wood-block floors, oak, maple, pitch-pine. On the whole, yellow deal is a good all-round timber, but for strength, durability, stiffness and appearance combined, oak and teak cannot be beaten. In specifying timber for general purposes, it is best to mention the defects that are to be avoided, and to examine the timber both when stacked and when being cut up, in order to ensure that these defects are absent. Examine timber before it is primed. Specifying the "ports" can only be useful when the architect has a considerable knowledge of timber, and it may safely be said that many of the clauses commonly inserted in specifications are really obsolete. If timber from certain ports is specified, however, in particular cases, the architect should know the brands and should examine the timber so as to make sure that it bears them: this can, of course, only be done in the stack. There are many methods for noting defects, decay, &c., such as tapping and noting the sound conductivity, while the exposure to the sun will emphasise shakes. Substitution of inferior kinds of timber can often be detected by weight: spruce is much lighter than yellow deal, and Cuban mahogany is twice as heavy as baywood or Central American.

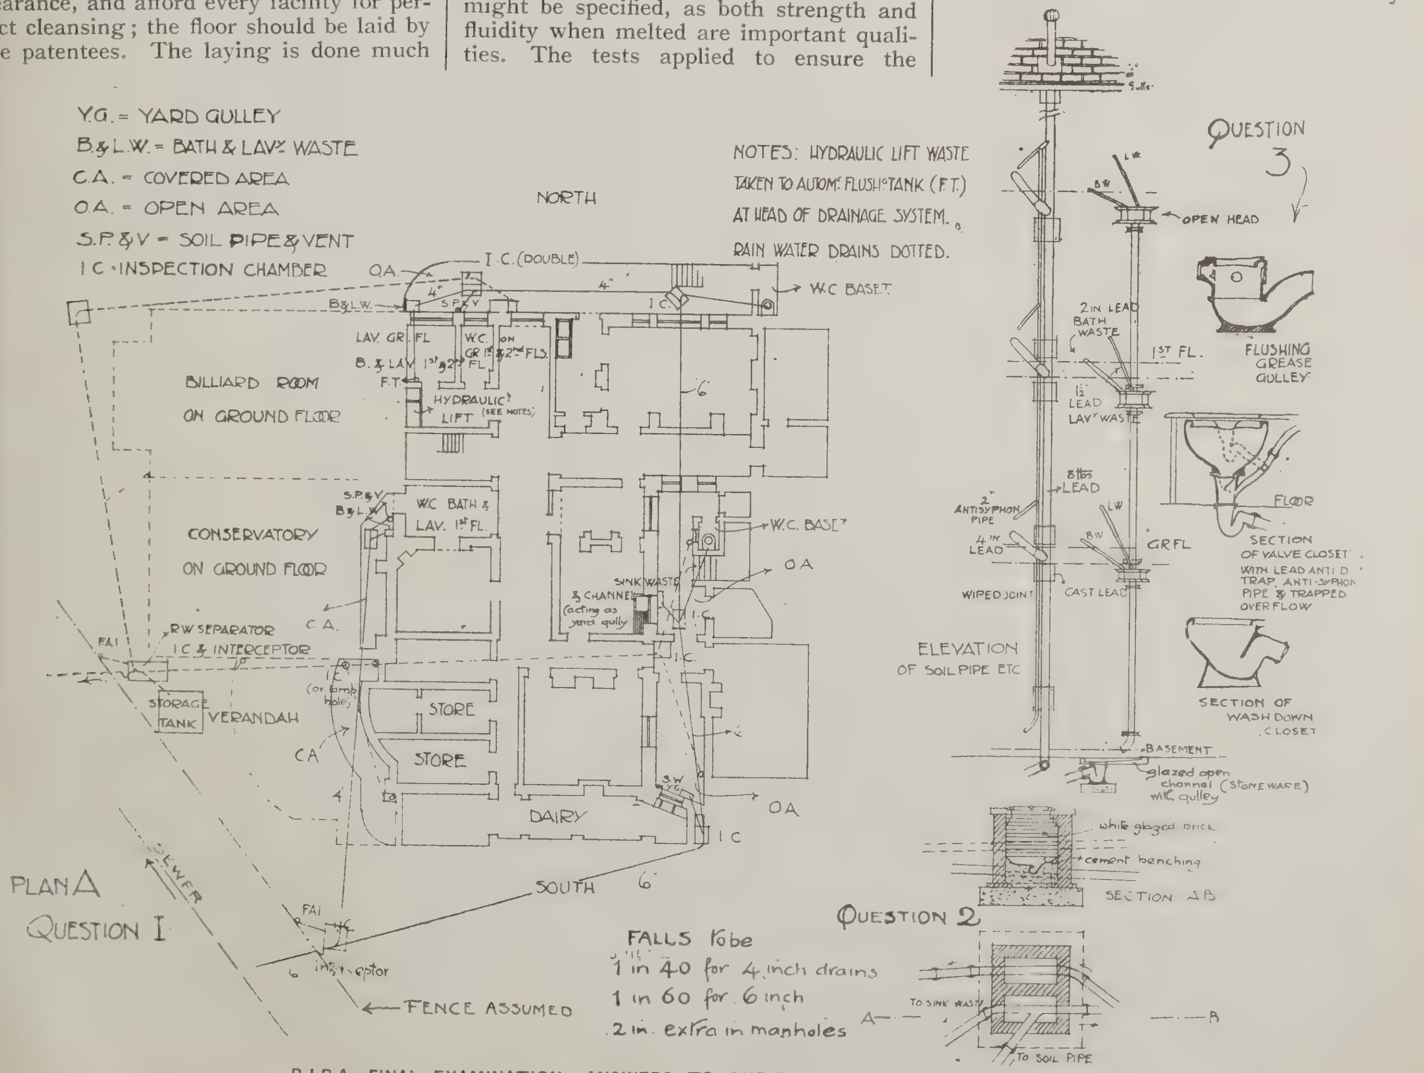
6. Give a list of the materials you would specify for floor, walls and ceiling of an operating theatre, selected for their non-absorbent qualities, and describe the method of laying or securing them and the final treatment of their surfaces.

In the case of each of the positions mentioned, floors, walls and ceilings, the specification would vary according to whether we were dealing with (a) entirely new work, or (b) an old building being brought up to date. Stress should be laid on the choice not only of the materials themselves designed to form the finished surfaces, but on the material forming the joints. Other things being equal, it is generally best to choose jointless materials; thus, for floors, I should specify that they should be finished in one of the several modern jointless floorings: these are not only non-absorbent, but are laid without joints of a different material. Moreover, they are not so cold as a cement floor, are of more pleasing appearance, and afford every facility for perfect cleansing; the floor should be laid by the patentees. The laying is done much in the same way as cement paving.

Again, in the case of walls, glazed tiles and glazed bricks are good; but it is impossible, even with neat cement, to ensure an absence of absorbent parts in the jointing, and difficult to entirely obviate dust and germ-collecting surfaces, owing to the slight unevennesses of the jointing material. I should prefer, therefore, to specify neat Parian or Keene's cement on a backing of Portland cement and sand, or coarse Keene's, &c. Old plaster might be made practically non-absorbent by covering it with a white metal sheeting with a hard, impervious elastic glaze, laid in large sheets with a special paste, and having few and closely-butted joints.

7. Specify the different qualities of steel and cast-iron you would use for a building of glass and metal, to be used as a winter garden, and the methods you would employ to check the quality and weight of the material when it is delivered on the site to ascertain that it was in accordance with the specification in all particulars.

The metal used, though in modern practice it might be of wrought-steel throughout (solid steel columns being now in use), may be regarded for the purpose of this question as being of four kinds—(a) for the vertical supports, either cast-iron or steel; (b) for the roof construction, rafters, &c., wholly or partly in compression, mild steel, rolled; (c) for the tensional parts, wrought-iron; (d) for the ornamental parts of the design, cast-iron. For cast-iron columns a mixture of what are known as No. 1 and No. 2 pig-metal might be specified, as both strength and fluidity when melted are important qualities. The tests applied to ensure the qualities required would be made on samples chosen at random, and would be roughly as follows:—A trial with a file, or a blow with a hammer, would indicate the degree of toughness or brittleness; and the light or dark-grey colour would be an indication of these qualities respectively. Careful examination of the surface (at the works, before painting) will be a necessary test for flaws, and trial with the blade of a knife will indicate soft parts, due to too much carbon. Bad mixing will be indicated by unevenness of surface. The transverse strength of test bars made from the same melting as the columns may be tested for deflection and fracture. For the mild steel in the roof, &c., Siemens-Martin steel might be specified, of British manufacture, of ultimate tensile stress of 28 tons per sq. in., with a minimum contraction and extension in length at time of fracture. Corresponding tests would be made on samples arbitrarily taken from each consignment. It might be specified in addition that the joists shall bend double cold without fracture, and certain bending and punching tests might be insisted upon. In this connection, it is worth noting that steel and iron may be distinguished by examination of fractured surface, by the use of dilute nitric acid to indicate the comparative proportion of carbon, and by hammering and chipping to ensure the proper toughness which steel should possess. Foreign joists sometimes owe their weight to an undue thickness of web; this can be guarded against by measurement; they must also be marked with the name of the country



R.I.B.A. FINAL EXAMINATION. ANSWERS TO QUESTIONS 1, 2 & 3, SUBJECT IV.

of their origin. Wrought-iron should be specified as Staffordshire best (or double or treble best, &c.). The usual tests are those to ensure tensional strength (20 tons per sq. in.), and fibrous rather than crystalline structure. The quality of cast-iron for the ornamental features would as a rule be left to the manufacturer, the appearance only being of first importance; hence fineness of grain, cleanness and sharpness of the impression, absence of surface flaws, would be the qualities demanded.

8. The painted stucco front of a high-class residence has got into bad repair. Specify the materials you would employ before re-painting to make good the places that were blistered and to make up the surfaces when the outer coat had perished before the work was painted. What are the causes of blistering, and how are they avoided or remedied?

There are two distinct matters requiring to be remedied—(a) the blistering or falling off in patches of the plaster, and (b) the blistering or decay of the paint. The causes of the former defect are (i.) damp walls, (ii.) particles of unslaked lime in the original plaster, (iii.) the use of inferior or unsuitable materials in the original plaster, (iv.) want of key between the first and finishing coats (the first coat should not be too dry before the finishing coat is laid). The causes of the second defect are (i.) too much oil in the paint on surfaces exposed to heat, (ii.) the surface of the cement not allowed sufficient time before the painting was executed (Portland cement should be allowed at least a year, or even two, before being painted); (iii.) insufficient time between coats of paint, or, in other words, there is a difference in the elasticity of the coats. In preparing the walls, care must be taken not to damage the parts that are sound, but at the same time all paint and plaster showing a tendency to scale must be removed by scraping. Sunk surfaces and cracks must be made good with Parian cement, and, before the last two coats of paint are put on, small holes, dents, &c., can be stopped with white lead and a colouring pigment. The surface of stucco takes four or five coats at least when new, and old work generally requires three coats, if a first-rate finish is desired. Before the first coat of new paint on old work, it is advisable to touch up with red lead and allow it to harden thoroughly. The quality of the paint used is important, and the lighter colours, or those which will carry a good body of white lead, are preferable: genuine old white lead and best linseed oil. Three thin coats are better than two heavy ones, if blisters are to be avoided.

Subject. IV.—The Arrangement and Construction of Buildings in Relation to Health, Drainage, Water Supply, Ventilation, Lighting and Heating.

[*Time of examination, two hours. Maximum number of marks, 75.*]

1. The plan (marked A) is the basement floor plan of a detached London mansion. The basement floor is 11ft. below the level of outside ground, and the distance to main sewer is indicated on plan, as are the positions of the w.c.'s, baths, and sinks, &c. Show by single lines the soil and rainwater drains and pipes, manholes, gulleys, &c., figuring the sizes of the pipes and manholes.

In answering this question the candidate is expected to make certain assumptions, as it would be impossible in the scope of an examination question to give sufficient information. In the answer given it is assumed for instance that (a) there is ample fall to the invert of sewer; (b) that there is sufficient space (the house being detached) to allow the drains to be kept entirely, or almost entirely, outside the house; (c) that it would be advantageous to store the rainwater for washing purposes—involving the use of a "separator," so that the water may be fairly free from soot, &c.; (d) that there is a sewer for stormwater distinct from the one indicated, but near to it; (e) the roof plan was not shown and position of downpipes not indicated—these are assumed; (f) stoneware drains are shown everywhere, encased in concrete where the drain passes beneath the floor of the house: iron drains could have been employed if preferred; (g) position of fence assumed.

2. Draw to ½-in. scale a section through a manhole in the area on north side and an elevation of the soil, waste, vent and other pipes at that point, figuring the dimensions and describing the material.

This question is sufficiently answered by the illustration. The candidate might add short "specification" notes on the quality required in the various materials indicated, as time permitted.

3. Draw to ½-in. scale what, in your opinion, is the best form of (a) valve closet, (b) wash-down closet, (c) grease-trap. Give the makers' names and brief description in each case.

In answering this question each candidate would probably mention the special forms affected in his own office, and it is unnecessary, therefore, to do more than indicate the lines on which the answer would be made. Nearly every patented form has some special feature, such, for instance, as a deep water-seal, a restricted outlet to increase the velocity of discharge, a special formation of the flushing rim, extra strength in the diaphragms which form the trap, self-cleansing formation of the bowl of the trap, different angles of inlet, special methods of jointing: these would be mentioned in describing the reasons for adopting any particular form. The illustrations show sections of a well-known example of each.

4. What steps would you take to cure dry rot in the floors of a warehouse where the floors are of the usual wood, iron and concrete constructions?

The question is not put as clearly as it might be, and in such a case it is as well to state clearly the reading the candidate has adopted. It will be sufficient for all purposes if we assume that the dry rot has attacked three floors of the warehouse of various construction, one (a) being of ordinary wood joists and boarding, one (b) of concrete on the solid ground laid with wood blocks, and one (c) an upper iron joist and coke-breeze concrete floor boarded direct. In all cases of dry rot it is impossible "to cure" the diseased wood itself; this must all be carefully removed and the surrounding, apparently unaffected, wood treated with creosote or other disinfectant. The next step will be to find out the causes leading to the decay, and to take special precautions to prevent its recurrence. The disease is usually in the wood before fixing, but the germs are sometimes produced and always encouraged by a damp and unventilated situation. In the case of (a) it would be probably found that the space beneath the floor had not been thoroughly ventilated by air-bricks, or possibly there was no concrete over the area below, nor any damp-course below the wood plate in both sleeper and main walls; or, supposing it is an upper floor, perhaps the rot first attacked the built-in and unventilated ends of the binders or girders and spread from these to the rest of the floor timbers. It would therefore be necessary in reconstructing the floor to see that these points were specially attended to. In the case of (b) it would probably be found that there was no proper layer of pitch between blocks and concrete, or, if in a damp situation, no horizontal damp-course either in, above or directly below the concrete to prevent ground or flood water rising; or it might be caused by the flooding of the floor from external doors, windows or areas, or even by careless swilling down of the floors; these would therefore be the points to consider and remedy in relaying the floor. In the third case (c) the rot was probably in the wood before it was laid, and was stimulated by either being laid before the concrete was thoroughly dry or by being covered (perhaps in the office) by linoleum, or even by damp sacks or similar goods not frequently moved. In any case removal of all diseased wood and the treatment of the sound wood and the concrete, etc., surrounding the diseased portion with disinfectant, and care that the precautions against the recurrence of the conditions causing the disease, would generally effectually prevent its further spread. But the thorough removal of all signs of disease, not only from the wood, but from the walls, floors and spaces below is absolutely of the first importance: sunlight and, where possible, abundant movement of air in every corner is the surest preventative of its occurrence in the first instance and will even do much to prevent its development in sappy wood having a special tendency to the disease.

5. State what you know about the regulations of public authorities as to (a) Open spaces at the rear of buildings, (b) Internal areas, (c) W.c.'s above and below ground level.

The answer to this question would to some extent depend on the locality in which the candidate has gained his experience: he must have a good working experience of either the London Building Act or the Model By-laws. Assuming the former, we notice first of all as to (a) that the stringency of the regulations is greater in the case where the building is in a new street: the minimum superficial area of the open space in the rear of such buildings, provided they are used for purposes of habitation, being respectively 150 sq. ft. and 100 sq. ft. in those laid out before and after the commencement of the Act. The Act proceeds to specify the minimum width to be that of the building, and the minimum depth to be 10ft. (with allowances for certain outbuildings not exceeding 9ft. in height), the minimum angle from back fence (63½ deg.) to be unobstructed by building; but these are modified in the case of old streets by raising the level to the height of 16ft. where the lowest floor is not constructed for habitation, &c. Exceptions to the normal are then provided for, as, for instance, corner sites and sites adjoining the river or public open spaces. Special rules govern dwelling-houses adapted to be inhabited by the working classes. As to (b) internal areas or courts within a building, when enclosed on all sides, and the height above ground-floor ceiling exceeds the greater cross measurement on plan, provision to be made for ventilation between lower end of court and outer air. Windows of habitable rooms in such areas to be at a distance from opposite wall equal to at least half the height from its sill to top of parapet. As to (c), references to the Model By-laws, or those made by the L.C.C. under the Public Health Act, show the following to be the principal regulations :—

1. One wall to be an external wall.
2. One wall to contain a window at least 2ft. by 1ft in the clear, and opening direct to external air (it is generally provided in addition that at least half of it may be opened, and the opening to extend to top of window).
3. In addition to window, a permanent ventilator, such as an air-brick, is required.
4. Separate cistern for flushing to be provided, disconnected from drinking water supply.
5. Form of basin and trap regulated.
6. Above ground level the regulations ensuring a proper soil pipe and adequate ventilation of drain would apply, and might be given by the candidate.
7. Not to be approached directly from any habitable room, &c.
8. No "container" or D-trap allowed.

6. *What is the best aspect for a dwelling-house, and why? What measures should be taken in damp, low-lying districts to ensure the sanitary conditions of the building?*

Speaking generally, the south-east is probably the best aspect for the principal rooms of a house, but regard should always be had to the purpose of each room and the part of the day in which it is likely to be used. A house should be so situated with respect to the points of the compass as to receive the sun in every room at some time of the day—hence the objection to a due south or north aspect. Exceptions to the general rule are often made where certain winds prevail, or by the seaside, or where a certain view or prospect forms an important feature.

In damp, low-lying districts the following would be the most important points requiring consideration :—

1. Drainage of sub-soil by agricultural pipes for a considerable area around building, to keep the ground water at least 2ft. from the surface when possible.

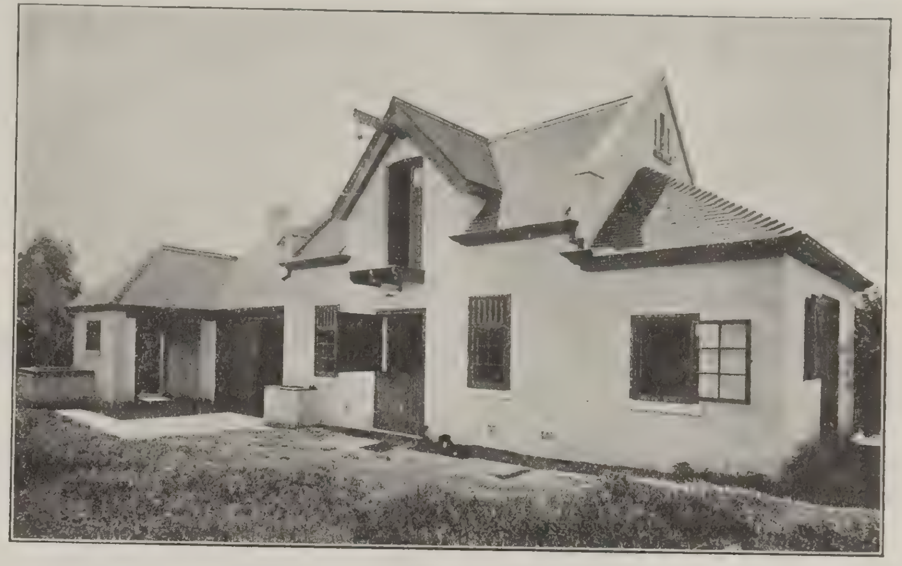
2. Plantations of such trees as are found to evaporate the greatest amount of moisture.

3. Avoidance of the use of a basement or any parts for habitation below the highest water level in the soil (sometimes, when floods occur, the damp-course, and consequently the ground floor, must be lifted considerably).

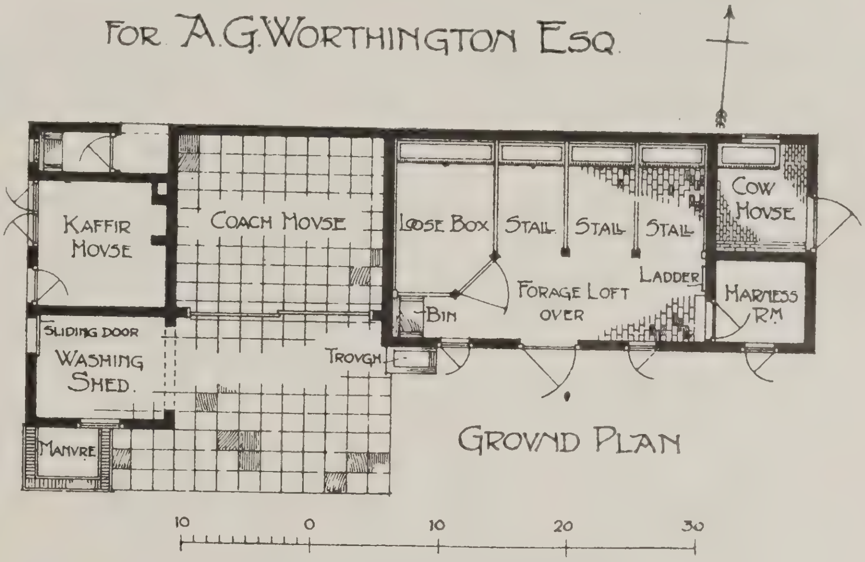
4. Careful attention to the concreting of the actual site and sometimes of a certain area in addition all round the building.

5. The use of the least-absorptive materials in the construction of the house.

6. A thoroughly good damp-course to all main and sleeper walls, and due regard to ventilation under floors. Where basements are unavoidable it is best to provide dry areas or at least vertical damp-proof courses.



STABLING AT PRETORIA FOR A.G. WORTHINGTON ESQ.



FREDERICK CHATTERTON, A.R.I.B.A., ARCHITECT.

THE SHEFFIELD SOCIETY.

Mr. E. Holmes, in his presidential address to the Sheffield Society of Architects and Surveyors last week, remarked that negotiations were now proceeding with the university authorities which he hoped would result in all future ordinary and general meetings being held in the new university buildings. A complete scheme for the education of architects and surveyors had been formulated by the Council and approved in general meetings, and was now only waiting the sanction of the university authorities. He had very little doubt that in a very short time the scheme would be in full working order.

He related the progress which had been made by the Council of the Society in their negotiations with the City Council with respect to the proposed new by-laws, which had tended to simplify them and render them more workable and practicable.

Amongst other subjects which had the attention of the Council he mentioned the question of compulsory registration of architects and surveyors, exhibition of model cottages, congress of architects, &c. He expressed the belief that the new road undertaken by the Corporation through the Rivelin Valley would prove a success both artistically and commercially. Speaking of the large number of vacant sites which are now in the possession of the Corporation, he suggested to the members of the Society that they might usefully turn their attention to the solution of how to deal with these vacant sites. Mr. Holmes also dealt with a number of other general subjects, such as the housing problem and local taxation.

Our Plates

New Premises, Pall Mall, S.W.

These premises, immediately opposite Marlborough House, are now being erected for the London and Lancashire Fire Insurance Co. The site was an extremely difficult one to deal with, as the public passage, Crown Court, runs through the centre of the building, dividing it into two narrow strips; and the opening to this court had to be made to suit the requirements of the County Council, irrespective of its effect upon the elevation. The building is faced with Portland stone, and the roof is of green-glazed Normandy tiles. The upper part will be let as chambers for bachelors. The builder is Mr. James Carmichael, of Wandsworth, and the architect is Mr. E. Guy Dawber, F.R.I.B.A.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Articles.

HIBERNIAN writes: "I have been with an architect in the capacity of pupil for three years, but had only a verbal agreement with him; no proper articles were drawn up between us. How could the matter be put on a proper footing, and would a deed drawn up now be legal? If so, should I pay any fee, or would an affidavit, stating the facts of the case, be sufficient evidence of my training?" My principal is willing to assist me in the matter."

An actual deed is not necessary to make articles of pupilage legal. I suggest that the case will be met by a formal certificate from the principal to the effect that the pupil had been with him in the position of an articled pupil from such a date to such a date, that the term of pupilage is now complete, and that the pupil had duly fulfilled all the conditions and obligations of that position. F. S. I.

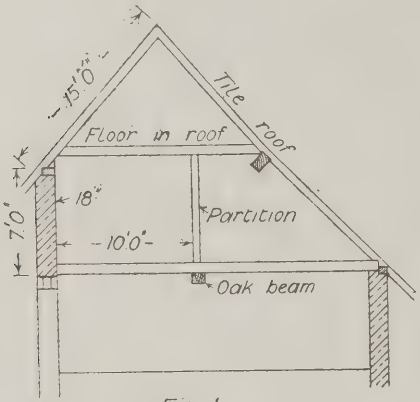


Fig 1

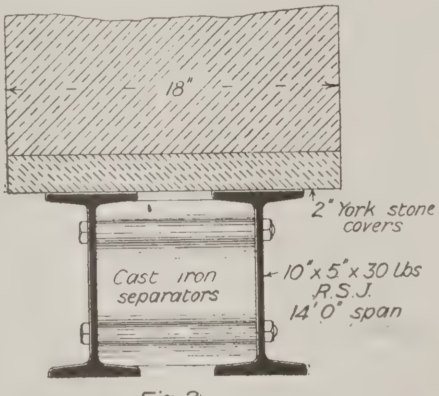

Fig. 2

STEEL JOISTS TO CARRY WALL.

Estate Agency.

HUDDERSFIELD.—ESTATE AGENT writes: "Which are the best examinations and qualifications for a land and estate agent? Also, which is the best weekly paper dealing with such work?"

The examinations of the Surveyors' Institution and the degree F.S.I. are, in our opinion, the best qualifications for a land and estate agent. As regards the best weekly paper on this subject it would be invidious to draw comparisons, and we advise you to obtain copies of the following and judge for yourself:—"Estates Gazette," "Estates Journal," "Land Agents' Record," and the "Estate World."

Fungus in Floor.

JARROW.—FLOORS writes: "I have received orders to repair several floors in a certain street. The houses were built about 30 years ago. About 10 years ago extra ventilators were put in, with holes in the middle walls to allow a current of air to pass from back to front. Recently a floor was pulled up and found to be in a wretched state. The under part of the flooring seemed to have a damp appearance, but the joists were covered with fungus, and bunches of it were hanging to the underside of the flooring. Even the skirting boards on the back were covered with it, and the boards fell to pieces when touched. Can you suggest a cure?"

You should increase the supply of air, and also coat the underside of the woodwork with creosote.

R.I.B.A. Testimonies of Study.

WALES.—CYMRO writes: "Is it permitted by the R.I.B.A. to draw as a testimony of study the Order from the monument of Lysicrates, as if the building were rectangular?"

We should say yes; although it would be better to draw any Order from existing remains as it actually is or was, in the correct relation for which it was designed. For further particulars, however, we would advise you to apply to the Secretary of the Royal Institute of British Architects.

Inspection Chambers.

CONSTANT READER writes: "It is intended to construct a roof over a yard. In this yard is an inspection chamber connected with a w.c. The surveyor says we must remove the chamber into the open air, as it is deemed an inlet to the drain within the meaning of the following by-law:—'A person who shall erect a new building shall not construct any drain of such building in such a manner as to allow any inlet to such drain [except such inlet as may be necessary from the apparatus of any water closet] to be made within such building.' (1) Is the chamber an inlet to the drain? (2) In any case is the surveyor's contention correct?"

We think that the surveyor's interpretation is quite correct, and also that the contention was quite legitimate. It is certainly injurious to have an escape of sewer air into a covered yard, where air is more or less stagnant.

Fire Insurance.

LONDON.—FIRE INSURANCE writes: "Is there any book published at a reasonable price which you can recommend to enable me as a fire insurance student to secure a knowledge of building construction? So far, the FIRE SUPPLEMENT of your journal is all I can find to help me."

We should advise you to get Dobson's "Art of Building" and "Specification" No. 9, price 2s. and 3s. 3d. respectively, post free from our offices.

Illicit Commissions.

CLERK OF WORKS writes: "A friend of mine has had premises built under the superintendence of the architect, usual terms. It has now come to his knowledge that the architect has received large sums of money from the different firms supplying materials, also from the builder, sums being provided for far in excess of their value. My friend has given the architect notice, dispensing with his services, and would like me to complete the work for him. The architect has had the ordering of nearly all the materials. In discharging him, how is the contract affected with the builder, who has paid him sums of money, and another contractor who has a separate contract for the shop-fitting? Which is the best way to proceed with the object of getting the work finished?"

Presuming what you say can be established as true, the architect has been guilty of a breach of trust. It might be possible to proceed against the contractors for the recovery of the money paid to the architect in the way of secret commission, and we have little doubt that you could secure damages against the architect. We advise the client to place the matter in the hands of a solicitor.

Steel Joists or Flitch Girder.

ERIQUE writes: "What size rolled steel joist would be sufficient to carry over an opening of 14ft. span a wall 7ft. high and 18ins. thick, old flint, with one window opening (3ft. by 5ft.) 2ft. from one end deducted? The wall carries an old Sussex tiled roof and floor. The rolled steel joist would also have to carry floor joists and weight of ceiling. Also, if a built-up wood bressummer were used with a $\frac{1}{2}$-in. flitch-plate bolted, what size would be required? Also, another opening as above, only 9-ft. span. Please show working out."

The working of this case (of which Fig. 1 shows the section) will be as follows:—Weight from wall $= 1{\cdot}5\ (14 \times 7 - 3 \times 5) \times 160$lbs. = 20,000lbs. = say 180cwts.; weight from roof $= (14 \times 5 \times 1) = 70$cwts.; weight from first floor $= (14 \times 5 \times 1) = 70$cwts.; weight from floor in roof $= (14 \times 5 \times 1) = 70$cwts.: making a total of 390cwts. = say 20 tons. Referring to a catalogue it will be seen that two (B.S.B. 17) 10″ × 5″ × 30lbs. joists will be sufficient, as shown in Fig. 2. For a flitched beam to do the same work, say three 14″ × 6″ beams with two $\frac{5}{8}$″ flitches. Breaking weight in cwts. in centre $= \frac{d^2}{L}(cb + 30t) = \frac{14^2}{14}(3{\cdot}5 \times 3 \times 6 + 2 \times 30 \times \frac{5}{8})$ $= 14\ (63 + 37{\cdot}5) = 14\ (100{\cdot}5) = 1{,}407$cwts. Allow a factor of safety of 6, then safe load $= \frac{1407 \times 2 \text{ for distrib.}}{20\text{cwts. in 1 ton} \times 6} = 23{\cdot}4$ tons safe load. The 9-ft. span may be worked in the same way, the load being $\frac{9}{14}$ of the above load, say 13 tons. HENRY ADAMS.

Royal Sanitary Institute: City and Guilds.

BRADFORD.—P. writes: "Please give name of book that would enable me to pass the examination of the Royal Sanitary Institute, or any set of questions for the same. Are the City and Guilds' questions in building construction published?"

Apply to the Secretary of the Royal Sanitary Institute, Parkes Museum, Margaret Street, W. The questions are given in the annual report of the City and Guilds of London Institute, published by Mr. John Murray, Albemarle Street, W., price 9d.

New London Buildings

At last week's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:

Formation of new streets for carriage traffic out of the east side of Erpingham Road and north side of Clarendon Road, Putney, so far as relates to the abandonment of the formation of the street proposed to be known as "Brickworth Street," and an alteration of the position, at its eastern end, of the street proposed to be known as "Landford Road," on the application of Lee and Pain-Clark. (*Consent.*)

One-storey buildings at the rear of seven shops on the eastern side of Garratt Lane, Wandsworth, northward of St. Andrew's Church, and in connection therewith the formation of a street, on the application of L. S. Rogers on behalf of J. and R. Heard. (*Refusal.*)

Re-erection of "The Three Jolly Gardeners" public-house, upon the site of No. 103, Union Street, and No. 31, Great Guilford Street, Southwark, on the application of F. J. Eedle and Meyers, on behalf of Truman, Hanbury, Buxton & Co., Limited. (*Consent.*)

Buildings on the southern side of High Street, Clapham, on the application of J. Donkin, on behalf of the trustees of the Foster estate. (*Consent.*)

Nine houses with shops on the western side of Askew Road, Hammersmith, northward of "The Sun" public-house, on the application of F. J. Brewer, on behalf of A. Gard. (*Consent.*)

Two studio buildings on the southern side of Logan Place, Kensington, on the application of G. H. Jenkins, on behalf of Professor G. Moira and F. L. Jenkins. (*Consent.*)

Addition in front of West Lodge, Blackheath, on the application of G. F. Havell, on behalf of Mrs. Penn. (*Consent.*)

Retention of projecting wooden reflectors at the premises of Waring and Gillow, Ltd., Winsley Street, Oxford Street, on the application of R. F. Atkinson, on behalf of Waring and Gillow, Ltd. (*Consent.*)

Projecting balcony and bay-window in front of No. 10, Maddox Street, W., on the application of Lander, Bedells and Crompton, on behalf of T. Coles. (*Consent.*)

Stone porch in front of No. 34, Hill Street, Berkeley Square, on the application of Brown and Barrow, on behalf of Col. Sackville West. (*Consent.*)

Projecting porch and two balconies in front of proposed buildings on the site of Nos. 344 to 354, Gray's Inn Road, St. Pancras, on the application of L. V. Hunt, on behalf of the Welsbach Incandescent Gas Light Co., Ltd. (*Consent.*)

Retention of a projecting clock in front of No. 48, Regent Street, Strand, on the application of R. H. Kerr, on behalf of Mellins, Ltd. (*Consent.*)

Buildings on the eastern side of Garratt Lane, Wandsworth, with flanks abutting also upon Waldron Road and Freshford Street, on the application of Holloway Brothers. (*Consent.*)

Eight houses with bay-windows on the east side of Upper Clapton Road, Hackney, between No. 174, Upper Clapton Road and Moresby Road on the application of G. H. Paine, on behalf of Jordain and Paine. (*Consent.*)

Three blocks of flats on the western side of Church Path, Stoke Newington, with projecting porches and four storey bay-windows, on the application of J. H. May, on behalf of J. M. Pritchard. (*Consent.*)

Projecting stone porch in front of a house on the eastern side of Old Oak Road, Shepherd's Bush, on the application of R. Norman-Hewitt, on behalf of the Rev. T. B. Monti. (*Consent.*)

Extension of a passageway across the rear of the third shop from the northward, in connection with the erection of nine houses with shops on the western side of Askew Road, Hammersmith, and the erection of a bakehouse abutting upon such extension at the rear of the second shop from the northward, on the application of J. J. Kelf. (*Consent.*)

Oriel window and balcony in front of a proposed block of buildings on the southern side of High Holborn, opposite New Oxford Street and partly on the site of Nos. 193 and 194, High Holborn, on the application of Warwick and Hall, on behalf of the Holborn Metropolitan Borough Council. (*Consent.*)

New shop front at No. 12 New Oxford Street, Holborn, on the application of Lee, Dickins & Co., on behalf of H. Hunt. (*Consent.*)

Building on the north-western side of Elthorne Road, Holloway, to abut also upon Boothby Road, on the application of G. Lethbridge, on behalf of the managers of the Highgate Presbyterian Church. (*Consent.*)

Projecting porch at the flank of No. 50, Carholme Road. Lewisham, to abut upon Marler Road, on the application of Norfolk and Prior, on behalf of G. A. Summers, (*Consent.*)

Two porches in front of a proposed block of buildings between Nos. 18 and 20, Cavendish Square, St. Marylebone, on the application of Gilbert and Constanduros. (*Consent.*)

Retention of an iron and glass covered way at the entrance to No. 3, Douro Place, Victoria Road, Kensington, on the application of Miss F. A. Lee. (*Consent.*)

Six houses with projecting one-storey shops on the northern side of Landor Road, Brixton, abutting also upon Atherfold Street, on the application of V. Vagnolini, on behalf of W. P. Goosey. (*Consent.*)

Retention of a detached greenhouse at the rear of No. 1, Bolingbroke Grove, Clapham, to abut upon Nightingale Lane, on the application of Dr. R. R W. Oram. (*Consent.*)

Buildings on a site abutting upon a new street to lead out of Ebury Street and also upon Grosvenor Gardens Mews North, Pimlico, on the application of A. F. Faulkner, on behalf of W. Willett. (*Consent.*)

Oriel window at No. 20, Warwick Street, Strand, on the application of J. N. R. Vining, on behalf of Liberty & Co. (*Consent.*)

Three houses on the site of Nos. 11 to 14, Hobart Place, W., on the application of Boehmer & Gibbs, on behalf of G. Trollope & Sons and Colls & Sons, Ltd. (*Consent.*)

Bay-windows and porches to houses on the north and south sides of Eatonville Road, and east side of Trinity Road, Tooting, on the application of W. C. Poole, on behalf of F. Eaton. (*Consent.*)

Three blocks of buildings on the eastern side and two blocks of buildings on the western side of Derinton Road, Totterdown Fields estate (section "C"), Tooting, on the application of R. Robertson, on behalf of the Housing of the Working Classes Committee of the Council. (*Consent.*)

Retention of one-storey shops at Nos. 36, 38, 40 and 42, Lower Richmond Road, Putney, on the application of W. West, on behalf of C. D. Collins. (*Consent.*)

Porches to two houses on the north side of Baldry Gardens, Streatham, on the application of W. J. James, on behalf of Wooding & Cole. (*Consent.*)

Retention of a projecting pilaster at the flank of a house in Upper Tooting Road, Wandsworth, abutting on the western side of Stapleton Road, and erection of shops on the southern side of Tooting Bec Road, on the application of Taylor, Willcocks & Co., on behalf of A. T. Wellings. (*Consent.*)

Shops on the eastern side of Balham Hill, Wandsworth, abutting upon Hazelbourne Road, on the application of P. Meredith. (*Consent.*)

Three shops upon the site of "Old Oak Villa," Uxbridge, Hammersmith, on the application of W. G. Ingram, on behalf of Griggs Brothers. (*Refusal.*)

Iron and glass covered way in front of No. 20, Lansdowne Road, Holland Park, Kensington, on the application of G. H. Fox, on behalf of T. Pocklington. (*Refusal.*)

Buildings on the eastern side of Muirkirk Road, Catford, to abut upon Dowanhill Road, on the application of R. Stewart, on behalf of A. Cameron-Corbett. (*Refusal.*)

Block of shops, with a concert hall over, upon the site of St. Paul's Church, Great Portland Street, St. Marylebone, on the application of Joseph and Smithem, on behalf of Perry Brothers. (*Refusal.*)

Wrought-iron arch on the forecourt of Nos. 168 and 170, Edgware Road, on the application of C. Hall, on behalf of E. S. Burns (*Refusal.*)

Workshop building at the flank of No. 59, Ashmore Road, Paddington, to abut upon Lydford Road, on the application of A. Hall, on behalf of W. H. G. Balchin. (*Refusal.*)

One-storey shop in front of No. 68, Richmond Road, Paddington, on the application of Barnett and Brotchie, on behalf of J. Snowman. (*Refusal.*)

Urinal at the rear of "The Nightingale" tavern, Nightingale Lane, Clapham, on the application of W. West, on behalf of T. Wallis. (*Consent.*)

Building on the site of No. 8, Allen Street, Goswell Road, Finsbury, on the application of E. B. I'Anson. (*Consent.*)

Building on the site of No. 16, Felton Street, Hyde Road, Hoxton, on the application of G. H. Lovegrove, on behalf of E. T. Pearce. (*Consent.*)

Billiard-room and lavatory addition at the rear of No. 32, Brompton Square. Kensington, on the application of Hubbard & Moore, on behalf of A. Simpson. (*Consent.*)

Boundary wall at the rear of No. 3, Bolton Gardens, Old Brompton Road, Kensington, on the application of W. Cave, on behalf of I. Walker. (*Consent.*)

Addition to the Durning Mission Hall, on the southern side of Elsa Street, Limehouse, on the application of A. S. Taylor, on behalf of Sir E. Durning-Lawrence, Bart. (*Consent.*)

Two water-closet buildings in the area of No. 13, Cambridge Place, Paddington, abutting upon Market Street, on the application of W. H. Smith, on behalf of the Humber Co., Ltd. (*Consent.*)

Latrines at the Wade Street (Roman Catholic) schools, Poplar, on the application of R. L. Curtis, on behalf of the managers of the schools. (*Consent.*)

Houses on the eastern side of Johnson Street, St. George-in-the-East, northward of St. Mary's Hall, on the application of Calnan and Son. (*Consent.*)

Building on the northern side of King Street, Camden Town, to abut upon Little Camden Street, on the application of S. G. Castleman, on behalf of Maple & Co., Ltd. (*Consent.*)

Building on the site of Nos. 195, 197, 199 and 201, Union Street, Southwark, on the application of H. Jarvis & Son, on behalf of Hayward Bros. and Eckstein, Ltd. (*Consent.*)

Building at the rear of No. 184, Camberwell Grove, Dulwich, to abut upon Stories Road and a roadway leading therefrom, on the application of A. Laycock. (*Refusal.*)

Buildings on the southern side of Narrow Street, westward of No. 108, on the application of J. M. Knight. (*Refusal.*)

Wooden fence at the rear of No. 279, Kingsland Road, Haggerston, and retention of wooden timber stage at the rear of the said premises, on the application of Wagstaff and Sons, on behalf of T. Jeffreys. (*Consent*).

One-storey wood and iron shed, at the eastern side of Dewar Street, Peckham, on the application of F. Webster and Son, on behalf of R. W. Atkinson. (*Refusal.*)

Iron and glass conservatory on the rear portion of the roof of the Bath Club, so far as relates to the erection of an iron and concrete enclosure to the gearing of an electric lift adjoining the said conservatory, on the application of C. Johnson, on behalf of the Directors of the Bath Club Company. (*Consent*)

Stable buildings on south-eastern side of Valentine Place, Southwark, on the application of W. Egerton, on behalf of the Maltina Co. (*Consent.*)

Oriel window at No. 3, Little Putney Street, Soho, Strand, on the application of J. P. Briggs, on behalf of Moss Vernon, (*Refusal*)

Building upon the site of Nos. 51 and 51A, Strutton Ground, Westminster, on the application of Glasier and Son. (*Consent.*)

Warehouse building on the south side of Layton's Buildings, Borough High Street, Bermondsey, on the application of Bailey and Wood, on behalf of Sissons Brothers & Co., Ltd. (*Refusal.*)

Addition to No. 74, Southgate Road, Hackney, on the application of Spiers & Son. (*Consent.*)

House on the northern side of Springrice Road, Hither Green Lane, Lewisham, on the application of J. Stanford, (*Refusal.*)

Formation of a new street for carriage traffic, to lead from Nightingale Lane to Temperley Road, Wandsworth, on the application of R. L. Freeman. (*Consent.*)

Formation of two new streets for carriage traffic upon the St. Quintin estate, on the western side of St. Helen's Garden's, Kensington, on the application of Trant, Brown and Humphreys, on behalf of W. H. St. Quintin. (*Consent.*)

Formation of new streets for carriage traffic on the Fairfield House Estate, Tooting, to lead from Mitcham Road to Totterdown Street, on the application of W. C. Poole, on behalf of Ayre and Kingcome. (*Consent.*)

Formation of a new street for carriage traffic, to lead from Fulham Palace Road to Colehill Lane, Fulham, on the application of A. Blackford. (*Refusal.*)

Formation of new streets for carriage traffic, to lead out of the western end and southern side of Chartfield Avenue, Putney, on the application of J. C. Radford, on behalf of Lord Westbury. (*Refusal.*)

Building, at Victoria Works on a site on the western side of Victoria Road, Old Charlton, to exceed 250,000, but not 450,000 cubic feet, and to be used only for the purposes of the manufacture of copper wire cables, on the application of Scott, Hanson and Fraser, on behalf of Johnson & Phillips, Ltd. (*Consent.*)

Addition to premises on northern side of Ashwin Street, Dalston, to exceed in height the width of the street, on the application of F. T. W. Goldsmith, on behalf of Reeves & Son. (*Consent.*)

Conversion of one-storey stable building on the north side of The Grove, Eltham, into a two-storey dwelling-house, on the application of C. A. Chapman, on behalf of F. Hare. (*Refusal.*)

At yesterday's meeting the following applications were reported :—

One storey addition at No. 21, Cumberland Mews, Regent's Park, at less than the prescribed distance from the centre of the roadway of the street. (*Rescission of resolution*; *refusal.*)

Buildings with projecting shop fronts, &c., on the site of Nos. 418 to 421, Strand, on condition *inter alia* that no vault, arch, cellar or other construction be made in or under the land. (*Rescission of resolution*; *refusal.*)

Projecting shop fronts in front of No. 63, High Street, Putney, on the application of A. Sykes, on behalf of Lilley & Skinner, Ltd. (*Consent.*)

Projecting one-storey shop in front of No. 131, Victoria Street, Westminster, and a projecting one-storey shop at the rear, to abut upon Ashley Place, so far as relates to the erection of projecting pilasters in front of the shop abutting upon Ashley Place, on the application of W. Woodward. (*Consent.*)

One-storey shops in front of Nos. 289 to 303 (odd numbers only) inclusive, Streatham High Road, Streatham, on the application of A. E. Chasemore, on behalf of G. W. Elvin. (*Refusal*).

Buildings on the southern side of Melrose Road, Southfields, eastward of Avenue Road, on the application of A. W. Taylor & Co., on behalf of A. Duff. (*Refusal.*)

Buildings on the western side of Bolton Mews, Kensington, at the rear of No. 6, "The Boltons," and at less than the prescribed distance from the centre of the roadway of Bolton Mews, on the application of A. C. Forrester, on behalf of S. V. Morgan. (*Consent.*)

Six houses on the site of "The Mount," Thurlow Park Road, Norwood, on the further application of G. Herbert. (*Consent.*)

Buildings with projecting shop fronts, bay windows and balconies upon the site of Nos. 418 to 421, Strand, to abut upon the Strand and Exchange Court, on the application of Crickmay & Sons. (*Consent.*)

Buildings on the northern side of South Row and western side of West Row, Kensal Town, on the application of E. W. Fagg, on behalf of J. Stockwell. (*Consent*).

Two iron and glass shelters at the Broadway Theatre, Deptford, to abut upon New Cross Road and Tanner's Hill, on the application of Vaughan, Brown & Cook, on behalf of D. Allen & Sons. (*Consent.*)

Projecting one-storey shops in front of Nos. 49 and 51, Queen's Road, Dalston, on the further application of Young Bros. (*Consent.*)

Twelve houses, with porches, on the western side of Hither Green Lane, Lewisham, on the application of Norfolk & Prior, on behalf of W. Rolfe. (*Consent.*)

Two dwelling-houses on low-lying land situated in Elmington Road, Camberwell, on the application of W. M. Proudfoot, on the behalf of S. F. Cope. (*Consent.*)

The Theatres and Music Halls Committee also reported the following :—

Drawing submitted by W. G. R. Sprague, showing certain additional means of ventilation which it is proposed to instal in the auditorium of the Aldwych Theatre, Kingsway. (*Consent.*)

Drawings submitted by H. Lewis of the Fawcett Liberal Club in Blechynden Street, North Kensington. (*Consent.*)

Drawings submitted by W. J. Ancell, showing a proposal to rebuild Challis's Royal Hotel. (*Consent.*)

Drawing submitted by T. H. Hiscott of the Colonnade Restaurant, Nos. 161A and 166, Strand. (*Consent.*)

Drawings submitted by E. W. Mountford of a building to be erected at Stockwell Green and to be known as Hammerton Hall. (*Consent.*)

Drawing submitted by J. M. Klempner of the Imperial Restaurant, No. 20, Shepherd's Bush Green. (*Refusal.*)

Drawings submitted by Wylson & Long, showing certain alterations proposed to be made to the seating at the London Pavilion Music Hall, Piccadilly. (*Consent.*)

Drawings submitted by F. W. Hingston of the Loughborough Hotel, Brixton. (*Consent.*)

Drawings submitted by A. C. Kent of Odone's Restaurant, No. 152 Victoria Street. (*Consent.*)

Drawing submitted by E. Runtz & Ford, showing how it is proposed to provide additional sanitary accommodation at the Pavilion Theatre, Mile End. (*Consent.*)

Drawings submitted by W. Woodward of the Piccadilly Hotel, Piccadilly. (*Consent.*)

Drawings submitted by F. Matcham & Co., on behalf of Moss' Empires, Ltd., showing the arrangements proposed to be adopted in the erection of a music-hall, to be known as the Finsbury Park Empire, on a site at the junction of St. Thomas's Road and Prah Road, Finsbury Park. *(Consent.)*

Drawings submitted by the Aberdeen Electrical Engineering Company, Limited, showing the arrangements in connection with the electric lighting installation which it is proposed to provide in the large public rooms on the basement and ground floors of the Waldorf Hotel. *(Consent.)*

Notes and News

The London County Council Architect's Department employs more than 200 assistants.

Theatre Alterations.— Messrs. Patman & Fotheringham, Ltd., have secured the contract for extensive alterations at the Savoy Theatre.

A New School at Old Kilpatrick, costing £19,400, has been erected from designs by Mr. D. Andrew, of Glasgow. It accommodates 1,420 pupils.

Aldershot Parish Church is to be enlarged, the old parts of the building being preserved as a south aisle. The architect is Mr. T. G. Jackson, R.A.

A Prize for Furniture.—Messrs. Waring have been awarded a Grand Prix and Gold Medal for high class furniture and decorative work at the Milan Exhibition.

Additions to the Royal Victoria Hospital, Craigleith, Edinburgh, are to be carried out. The architects for the work are Messrs. Sydney Mitchell & Wilson, of Edinburgh.

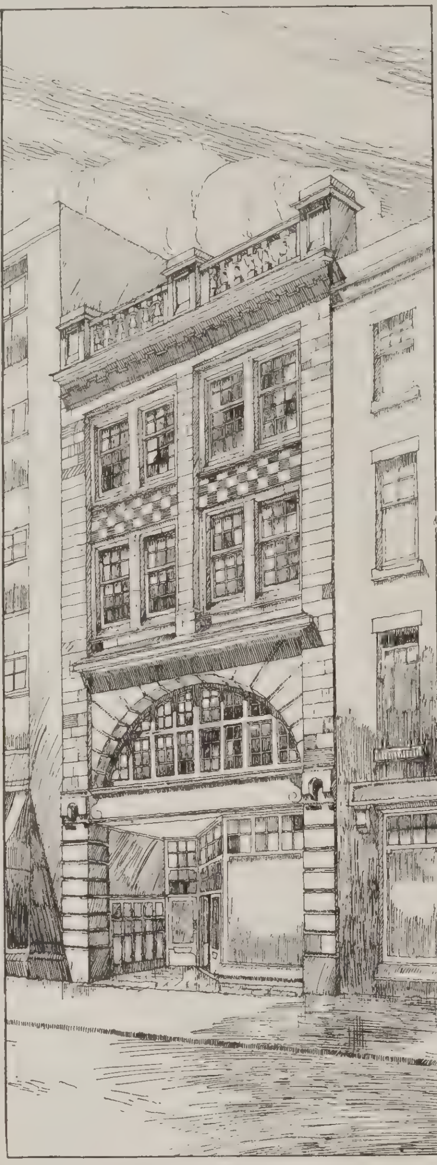
At the Milan Exhibition two gold medals, two silver collaborateur medals and one bronze medal were awarded to Messrs. Simplex Conduits, Ltd., for their exhibits.

New Union Offices at Lanchester were opened last week. Messrs. Newcombe & Newcombe, of Newcastle, were the architects, and Mr. J. Robson, of Waterhouses, was the contractor.

An Architect Mayor.—Mr. F. W. Dixon has accepted the invitation to the Mayoralty of Southport for the coming year. Mr. Dixon is an architect in business in Manchester and Southport.

The Society of Arts has just published its programme for the 1907 examinations. This gives full details about the whole scheme, with much information useful to intending candidates and a reprint of all the papers set this year.

At the Girls' High School, Truro, a new wing for laboratories and technical instruction is being added. The architect is Mr. E. R. Robson, of Westminster, and the builder Mr. John Colliver, of Truro. Like the original building, the walls will be of Plymouth limestone, with dressings of Cornish granite.



BUSINESS PREMISES, WINNIPEG.
INGALL, SON AND MITTON, ARCHITECTS.

The ground floor of these premises is devoted to an artist's store and picture gallery, the first and second floors to offices, and the top floor to a photographic studio, &c. The front is intended to be executed in local stone, relieved by tile or brick bands. The architects are Messrs. Ingall, Son & Mitton, of Birmingham and Truro.

The North Library of the Islington Borough Council, Manor Gardens, Holloway Road, was opened recently by the Mayor of Islington. Mr. H. T. Hare was the architect, and Patman & Fotheringham, Ltd., were the contractors.

Gold Medal for Sir William Richmond.—The Council of the Institute of British Decorators has awarded its first gold medal to Sir W. B. Richmond, K.C.B., R.A., in consideration of his important decorative work in St. Paul's Cathedral. It has been arranged to have a public presentation at Painters' Hall on Monday, November 26th.

Glastonbury Abbey for Sale.—The ruins of Glastonbury Abbey are shortly to be offered for sale. In connection with them there is the customary rumour that an offer of purchase has been received from America. The hope is expressed that, following the precedent of Tintern, the Government should acquire the ruins as a national possession.

An Amalgamation has taken place between the Birmingham Guild of Handicraft, Ltd., and Gittins Craftsmen, Ltd., who will in future carry on the joint businesses under the name of the former company at 45, Great Charles Street, Birmingham, and at 7, Newman Street, Oxford Street, London, W. The company retains the services of the directors, designers and principal craftsmen of both the amalgamated firms.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have secured the order for glazing on their "Eclipse" patent imperishable system the roofs of extensions to works of Messrs. Thornycroft & Co., at Woolston; the Premier Cycle Co., Ltd., Coventry; F. W. Cotterill, Ltd., Darlaston; Richardson, Westgarth & Co., West Hartlepool; Hawthorn, Leslie & Co., Newcastle-on-Tyne; also export orders for Holland, South Africa and Denmark.

The Inspectorship of Ancient Monuments.—If the Government should decide, in accordance with the wishes of the Congress of Archæological Societies, to make an appointment to the vacant Inspectorship of Ancient Monuments, it might be well for them to increase the scope of the officer's duties, says the "Evening Standard and St. James's Gazette." He might be instructed to keep an eye not only on ancient monuments and historic remains, but on the statues of the living present, and on the niches where statues should be but are not.

Another Garden City.—An agreement has been arrived at between the Garden City Association and the owners of the Alkrington Hall estate, which is within 14½ miles of the Manchester Exchange, and about the same distance from Oldham, whereby the association obtains an option of purchase. The site is an excellent one, and comprises between 700 and 1,000 acres of good land about 400ft. above the sea level. It is proposed to develop it on the same lines as the Garden City at Letchworth. A company is to be formed to complete the purchase, and it is expected that part of the land will be taken possession of by the Manchester Tenants, Ltd.

Obituary

Mr. James MacIntosh, the well-known art decorator, by whom the decorations of the Royal Mausoleum at Frogmore and other important buildings were carried out, died last week, aged 60 years.

New Companies.

J. EDMONDSON & SON, builders, contractors, &c., Winchmore Hill, Muswell Hill, Sydenham Road and Woodford. Capital: £45,300.

LITTLER CONCRETE CO., to take over the business of artificial stone manufacturers carried on by G. W. Littler and S. Littler, at Runcorn. Capital: £6,000.

JOHN ADAMS & CO. (Leicester), to take over the business of builders' merchants, slaters, tilers, and coal merchants carried on by J. Adams, at St. George's Gate and Omberstone Road, Leicester. Capital: £3,000.

JOSEPH H. PEARSON, LTD., to acquire the business of ironmasters, &c., carried on by A. Pearson, R. T. Pearson and E. Y. Pearson at Park House Colliery, Staffs, as Joseph H. Pearson, and to carry on the same and the business of colliery proprietors, coke and brick manufacturers, miners, &c. Capital: £30,000.

Notes on Competitions

The period of summer vacations and official inactivity having drawn to a close a few faint signs of life are manifesting themselves in the world of competitions. The evidences do not, so far, bear witness to a healthy awakening, and can only prove disappointing to the army of combatants who, refreshed by enforced abstemiousness, are now waiting, fully equipped, eager for the fray. That there are some who will accept the few challenges that have been sent and who will enter the lists regardless of the insufficient rewards offered for those appointed to receive them, by judges lacking the necessary qualifications, is, unfortunately, a contingent which the past has made but too certain. That the majority will stand off and reserve its efforts for a fairer field or until such time—if it arrives—as the present challenges shall have been modified is, happily, a contingent that can also be relied upon.

Until recently it was possible to classify defects in conditions of competitions under certain recognised headings. This year a new fault has had to be dealt with, one which has been referred to in these columns as an attempt, on the part of promoters, to lay a competition open to the lowest bidder, by a request that competitors would state the terms they would require for their services, if successful. Such was the case at Barnsley, where competitors for a school were selected from applicants who were required to state the amount of commission they would be prepared to accept. Acting, no doubt, upon numerous representations, Barnsley eventually announced that the usual remuneration would be paid, and so the trouble passed, leaving the hope that, by its rareness, it would not be met with again. Now it has broken out in two new places in conjunction with the recurring complaint of "no assessor," and, as might have been anticipated, the subjects are libraries.

Carnegie Public Library at Earlestown, Lancashire.

The promoters are the Newton-in-Makerfield Urban District Council. In the announcement of the competition it is required that architects shall "state their inclusive terms for the preparation of all necessary plans, specifications, bills of quantities, both as regards the library itself and the permanent fittings, and for superintending the work during construction." The cost of the library, including permanent fittings, furniture, &c., and architects' inclusive charges, is not to exceed £4,000. The conditions—if they can be so called—are in the form of a one-sheet letter signed by the Clerk to the Council. They contain no mention of an assessor, nor of how, and by whom, the designs will be selected. Enquiries have been made of the Town Clerk as follows:—"1. Will a professional assessor be appointed, and, if not, who will judge the designs? 2. Will the assessors be influenced by the lowness of the terms quoted by any competitors for the preparation of drawings, &c.? If so, the best design might be disqualified if it were accompanied by the author's quotation upon recognised scale rates. In a building of this size and nature the ordinary recognised scale of charges is little enough." The Town Clerk has replied:—"Although nothing has been mentioned as to the appointment of an assessor to judge the designs, the committee will doubtless call in one. As regards the terms I cannot state more than is mentioned in the advertisement." This is a very diplomatic reply. As it has been made to an intending competitor it must be regarded as final. The lack of definite information as to assessing ought, therefore, by the prudent, to be interpreted as "no professional assessor," and the question of fees, viewed similarly, ought to be taken to mean "success to the lowest bidder."

Free Library, Treharris, Merthyr Tydfil.

This case is almost identical with the former. There are absolutely no conditions beyond the information contained in the announcement of the competition. Here the expenditure is given as not to exceed £1,750, presumably inclusive of fees, but not so stated, and "Competitors are requested to state their terms for preparation of the necessary contract plans and detailed drawings, specification, bills of quantity and architect's supervision during erection." It is also stated to whom and by what date the designs are to be submitted, but whether they are to be accompanied by a report in a sealed envelope, or are to be marked with a nom-de-plume or motto, or signed by their authors, is apparently left to the competitors' judgment. An application for conditions was productive of a block plan, without figured dimensions, to a scale of 44ft. to the inch, and of a half sheet of paper, startling in the brevity of its wording, "Treharris Free Library. Accommodation. Reading Room. Lending Library. Caretaker's Room. Reference Room. Ladies' Reading Room and Lavatory. Gentlemen's Lavatory and Conveniences in Basement." In reply to enquiries similar to those made of the Town Clerk of Earlestown, the borough engineer of Merthyr Tydvil has written, "The advertisement and the particulars already sent convey all the information I have. The Corporation have not, so far as I know, gone into the question of an assessor." The same interpretation must therefore be put upon these matters as in those of the preceding case.

New School, Gaywood, Norfolk.

There have been so many applicants for conditions of this competition that the promoters have limited it to architects whose offices are situated in Norfolk. Designs are to be sent in by October 22nd.

The New County Hall.

In an interview which a "Tribune" representative had with Prof. Beresford Pite last week we notice some references to the new County Council Hall, and the competition which is to be held for the design. Prof. Pite is reported as having said: "The site at the south end of Westminster Bridge is almost an ideal one for the purpose. It will induce a long, comparatively low building, stretching along the river much as the Houses of Parliament do—and, we may hope, will provide us with as interesting and beautiful a building. This site provides an opportunity for British architects, the like of which they have not had for a long while. If architects were numerous enough for their votes to count, the absurd proposal that foreigners should compete for the design would already have been eliminated from the Council's programme. Whether the County Hall is to be an improvement or a blot is, of course, a most serious matter, and the action of the County Council seems to imply a fear on their part that English architects alone would not be able to supply a worthy building. In all aspects of building, where freedom and traditional association are of account, English architecture is confessedly more full of life and vigour than that of the Continent. We do not want those elements to be absent from the new County Hall. With Somerset House, the Houses of Parliament, the Adelphi, and New Scotland Yard on one side of the river—all the work of British architects—it will be very strange if it proves necessary to employ a foreign architect to design London's own municipal hall on the other."

"The Architectural Review" Alphabet Competition.

The designs submitted in this competition are to be exhibited at the premises of the Architectural Association from Saturday, November 17th, to Saturday, November 24th. Admission on Saturdays from 10 to 4; on other days from 10 to 6.

Proposed new Town Hall for Dundee.

Speaking at a meeting at Dundee last week, the Lord Provost said that the public had shown that it wished a new town hall to be erected, and he expressed the desire that a competition for the building should be held among Dundee architects.

Rebuilding of Henshaw's Blind Asylum, Manchester.

The awards in this competition, which is limited to Manchester architects, will, we understand, be made known in December. The assessor is Mr. John Holden, F.R.I.B.A.

Dublin Technical Schools.

Architects in Dublin have presented a memorial to the Irish Institute urging that a deputation be appointed to wait on the Dublin Corporation with the object of securing a local competition for the design of the new technical schools.

Workmen's Houses, Tranent, Midlothian.

The competition for these houses, which are to be erected for the Co-operative Society, has resulted in the selection of the design by Mr. Edward C. H. Maidman, architect, of Edinburgh. The estimated cost of the work is £2,046.

List of Competitions Open.

DATE OF DELIVERY	COMPETITION.
Oct. 20	SEWERAGE SCHEME FOR HIGHBRIDGE, Somerset. Premium £20. Particulars from W. C. Shier, Surveyor to the U.D.C., Highbridge.
Oct. 22	SCHOOL AT GAYWOOD, King's Lynn. Particulars from Secretary, County Education Office, 57, London Street, Norwich.
Oct. 31	BOURSE AT CAIRO.—Premiums of £E250 and £E100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Nov. 30	LIBRARY AT NEWTON-IN-MAKERFIELD.—Cost £4,000. Particulars from C. Cole, clerk to U.D.C., Town Hall, Earlestown, Lancs.
Dec. 14	FOUNDLING HOSPITAL, MONTEVIDEO.—Four selected designs in preliminary competition to be awarded £212 each; first premium of £742 in final competition. Particulars from Consulate-General for Uruguay, 5 & 6, Clement's Inn, London, W.C.
No date	NEW COUNTY HALL, LONDON. Particulars from G. L. Gomme, clerk, L.C.C., Spring Gardens, S.W.

DEVELOPMENT OF LIVERPOOL

Presidential Address to the Liverpool Architectural Society.

Mr. Edmund Kirby, F.R.I.B.A., in his presidential address last week to the Liverpool Architectural Society, said that nearly twenty years ago that Society honoured him by electing him president. Having briefly alluded to the Society's position in the old days, he dealt with the developments which had since taken place in the improvement of the classical style of architecture, and the influence of Mr. Norman Shaw's work in this direction. The result in the present day had been the erection of many fine buildings in London and the provinces. Among the latter one of the first examples of the classical style on a large scale in Liverpool was the stately building and the costly offices erected by the Royal Insurance Co. There were also the fine buildings, approaching completion, of the new Cotton Exchange and the new offices of the Mersey Dock Board. As regards the two large vacant sites at the George's Dock, the northern one of which had lately been sold by the Corporation for the erection of new offices, whilst it was reported that the larger vacant space between it and the Dock offices was also to be purchased for building purposes, Mr. Kirby said it was to be hoped that the best architectural efforts would be put forward by the purchasers and the new owners in the development of these schemes to render them worthy of such sites, rare in a great commercial centre, with unique advantages for architectural display, with practically unlimited light and air, and great open spaces on every side in which to enjoy the beauties of the buildings they might suround. The opportunity was thus presented of achieving at what might be called the "gate of the city" an effect of architecture which, when completed, and in conjunction with the Dock offices already erected, would command a frontage to the noble river worthy of rivalling that presented by the quays of Venice. He did not know what control, if any, of the plans and elevations had been reserved by the Corporation of Liverpool over the erection of any schemes that might be put forward for the adjoining sites, but he would point out that in similar cases of choice of sites in London the Council of the Royal Institute of British Architects had for several years been asked to advise the Government and also the London County Council upon the designs of new buildings and the laying out of important new routes and street developments before erections thereon were permitted to be begun. He felt confident that the Council of the Liverpool Architectural Society had men in its body to whom the City Council could, similarly to London, refer such questions of design, and with the same excellent results.

In the last 20 years changes had been so numerous in Castle Street that it might be said to be nearly rebuilt. With the Town Hall as the end of the vista of view looking north, he knew no commercial street, even in the city of London, comparable with it for appropriate and complete architectural effect. Having referred to the erection in an up-to-date style of branch banks, free libraries and schools, the great tobacco warehouse, the grain warehouses at the south end, and the new Corporation small-pox hospital at Fazarkerley, which from the reports on all sides seemed to be the best hospital in the country, Mr. Kirby said he rejoiced that the new Cathedral was rapidly being pushed on, and its progress would be watched with the keenest interest in the development of its fine and original design. The International Congress of Architects, held in London in July last, discussed municipal work and the housing of the working classes. Liverpool was sadly backward in this movement. Some drastic orders were in progress for the sweeping away of some of the worst dwellings of the poor. Whatever was done, he trusted that cottage houses (preferably with small gardens) might be adopted in preference to the "flat" system, the cottage houses being more wholesome and healthier than high-"flatted" houses.

Trade and Craft.

Fastening Corrugated Iron Sheets.

There is an old proverb that says "Take care of the pence and the pounds will take care of themselves." The same idea applies in many ways to construction. The small common things are often of supreme importance, and yet we are all inclined to pay little heed to them. The fastening of corrugated sheets is a case in point. We have had to wait for Mr. Frank G. Price, of Calcutta, to offer a satisfactory solution of the problems entailed. In India, as in all our Colonies, galvanized corrugated sheets are more extensively used than in this country. Mr. Price must have been far more struck than architects and engineers in this country by the short life of galvanised corrugated sheets. It is usual, indeed, to tar or paint such coverings every few years, but whereas one would have supposed that this would have indefinitely prolonged their life as long as painting was continued, it is only effective up to a certain point, because the decay takes place where the paint does not penetrate—namely, at the bolt-holes, which never seem to be water-tight, although they may be puttied. The fault is with the washer commonly employed. It is obvious that when a flat washer is put upon a curved surface moisture can get under. The very place where the sheet is least able to resist corrosion is thus exposed most, because the galvanising has been removed by punching the hole for the bolt, and damaged in all probability in its immediate neighbourhood. The solution of the trouble which Mr. Price offers is a very simple one—namely, a cup-shaped washer to which is given the suggestive name of "the Limpet." The little domed discs, shown in section in Fig. 2, possess the property of altering their original shape when screwed down to a corrugation, and of assuming a somewhat elliptical form with a true and perfect bearing on the surface to which they are applied. The "Limpet" washers adapt themselves to any position, not only on the top of a corrugation, but also in the hollow. The ordinary system of fastening sheets is clearly compared with the new in Fig. 1.

As will be seen in the detail view (Fig. 2.), the washers are provided with a lip or rim round the hole, which, besides being an advantage where ordinary bolts are used, is a special feature in connection with Price's "Limpet" bolts, which are made with a corresponding groove under the head so as to engage this lip or rim (as shown in Fig. 2). No putty or red lead is required, and the "Limpet" washers completely protect a considerable area of the sheet round the hole—just what is required.

Another advantage in the "Limpet" is that it acts as a locking washer, and prevents any slacking of bolts due to expansion or vibration, for it maintains a continual tendency to spring back to its original shape. Extreme changes of temperature have been found to exercise a very prejudicial effect on corrugated iron roofing, and this further feature in the washer will serve to reduce the racking strain thus caused.

The "Limpet" washers are at present made in three types, as follows :—

Type No. 1 is formed of No. 22 B.W.G. mild steel; the diameter of the washer is $1\frac{1}{4}$ins., and the height of the concave is $\frac{3}{8}$in., with a lip or rim $\frac{1}{32}$in. high round the hole upwards. This type is made in two sizes—one to pass $\frac{3}{8}$-in. bolts, and another to pass $\frac{1}{4}$-in. bolts, and is intended for use with hook bolts and other main connections.

Type No. 2 is formed of No. 24 B.W.G. mild steel; the diameter of the washer is $1\frac{1}{8}$ins., and the height of the concave is $\frac{5}{16}$in., with a lip or rim $\frac{1}{32}$in. high round the hole upwards. It will pass $\frac{1}{4}$-in. bolts, and is intended for seam joints in the sheets.

Type No. 3 is formed of thin metal, about 28 B.W.G.: the diameter of the washer is 1in., and the height of the concave is $\frac{1}{4}$in., with a lip or rim $\frac{1}{16}$in. high round the hole upwards. It will pass $\frac{3}{8}$-in. bolts, and is intended for use under wind ties, the method adopted where these are employed being to place one washer between the sheet and the wind-tie, and one above the latter. The lower washer, being of thin metal, collapses when the bolt is screwed home.

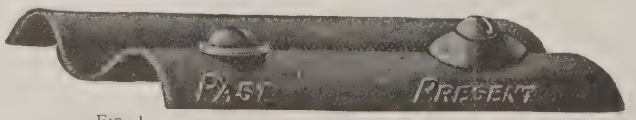


Fig. 1.

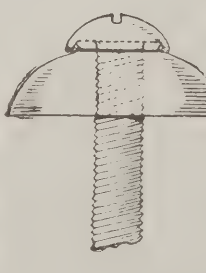

Fig. 2.
THE "LIMPET" WASHER, BOLT AND DRIVE-SCREW.

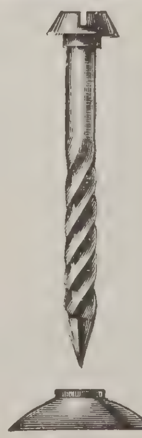

Fig. 3.

The washers are equally well adapted for holding down by screws in wooden frame buildings. As, however, the ordinary roofing screws require considerable time and labour in use, an improved drive screw for use with these washers has also been placed upon the market. Its form is as shown in Fig. 3. It is driven like a nail and has the holding power of a screw, with the advantage of not requiring boring. These drive screws are supplied in the following sizes:—2in., $2\frac{1}{4}$in., $2\frac{1}{2}$in., $2\frac{3}{4}$in., & 3in. by No. 14.

We refer at this length to these small commodities because they are obviously of very great importance, and there is no doubt in our mind that they ought to be regularly specified where iron sheeting is used. Messrs. William Jacks & Co., of 5, East India Avenue, London, are the patentee's sole managing agents, but the articles can be obtained through any wholesale or retail ironmonger.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that **readers will find particulars in our previous issues of other contracts that still remain open.**

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Oct. 18. Fenton.—*Erection of public underground conveniences.* Persons desirous of tendering are requested to send in their names to S. A. Goodall, surveyor to the Council, Town Hall, Fenton. The tenders are to be delivered not later than Oct. 18.

Oct. 18. Belfast.—*Additions to premises in Montgomery Street* and Gloucester Street, Belfast, for J. Robson, Limited, according to the plans and specification, which may be seen of V. Craig, F.R.I.B.A., architect, 22, Donegall Place. Bills of quantities may be had from S. C. Hunter, Scottish Provident Buildings. Tenders to be lodged with V. Craig not later than 10 a.m. on Oct. 18.

Oct. 19. London, S.E.—*Erection of public library* at the junction of the Old and New Kent Roads in accordance with the plans and specifications of C. Batley, A.R.I.B.A. The plans and specifications may be inspected at the Town Clerk's Office, Town Hall, Walworth Road, any day between the hours of 10 a m. and 5 p.m., except Saturday. Persons desirous of tendering must forward their names to J. A. Johnson, town clerk, Town Hall, Walworth Road, S.E., together with a list of buildings of a similar character erected by them, not later than Oct. 19, at noon.

Oct. 22. Glasgow.—*Construction of offices* for Carron Company contract, on the tongue at Grangemouth Docks, for the directors of the Caledonian Railway Co. The drawings may be seen at the office of the company's engineer, Buchanan Street, Glasgow, where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Construction of Offices for Carron Company at Grangemouth Docks," to be lodged with J. Blackburn, secretary, Caledonian Railway Co.'s Offices, 302, Buchanan Street, Glasgow, on or before Oct. 22.

Oct. 23. Salford.—*Removal of existing buildings* and the erection of a recreation-room at the rear of the Branch Library in Greengate, Salford. Drawings may be seen, forms of tender and combined specification and bill of quantities obtained at the Borough Engineer's Office, Town Hall, Salford. Tenders, endorsed "Recreation-room, Greengate," addressed to the Chairman of the Museum Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 4 p.m., Oct. 23.

Oct. 23. London, E.—*Erection of an additional furnace* in connection with the dust-screening apparatus at Marian-square, for the Metropolitan Borough of Bethnal Green. Plans and specification can be seen, and form of tender obtained, upon applicatipn to the Borough Engineer and Surveyor, at the Town Hall, Church Row, Bethnal Green, between the hours of 10 a.m. and 4 p.m. Fair wages clauses. Tenders. sealed, and endorsed "Furnace," must be delivered to R. Voss, town clerk, Town Hall, Bethnal Green, E., not later than 12 noon on Oct. 23.

Oct. 23. Selby.—*Erection of cottage, office, and boundary wall,* at the New Waterworks, Brayton Barff, Selby, for the U.D.C. The drawings and specifications can be seen at the offices of Percy Griffith, M.Inst.C.E., engineer, 54, Parliament Street, Westminster, S.W., and Bruce McG. Gray, A.M.Inst.C.E., engineer, Council Offices, Selby, and forms of tender and bill of quantities may be obtained on payment of a deposit of £1 1s Sealed tenders endorsed "Cottage, etc.," to be delivered to J. H. Bantoft, clerk to the Council, Council Offices, Selby, not later than 12 noon on Oct. 23.

Oct. 24. St. Helens.—*Additions to Cowley Middle Schools,* Cowley Hill Lane, St. Helens, for the County Borough Council. On deposit of the sum of £1 1s., plans and specifications may be inspected and bills of quantities and conditions of contract obtained at the offices of Frank S. Biram, architect, Hardshaw Street, St. Helens. Sealed tenders, endorsed "Tender for Additions to Cowley Schools," must be delivered to W. H. Andrew, town clerk, Town Hall, St. Helens, Lancashire, not later than 10 a.m. on Oct.-24.

Oct. 24. St. Helens.—*Erection of new schools* at Parr, St. Helens, for the Borough Council. On deposit of the sum of £1 1s., plans and specifications may be inspected and bills of quantities and conditions of contract obtained of F. S. Biram, architect, Hardshaw Street, St. Helens. Sealed tenders, endorsed "Tender for New Schools, Parr," must be delivered to W. H. Andrew, town clerk, Town Hall, St. Helens, Lancashire, on Oct. 24.

Oct. 24. Wolverhampton.—*Erection of new cart sheds* at the Team Committee's Depot in Crown Street, in accordance with the plans, which may be seen, and specification and bill of quantities to be obtained on application at the office of G. Green, borough engineer, Town Hall, Wolverhampton. Sealed tenders, addressed to the Chairman of the Team Committee, and endorsed "Tender for Sheds," to be delivered at the Town Clerk's Office, Town Hall, not later than 10 a.m. on Oct. 24. Fair wages clause.

Oct. 25. Horsham.—*Extending the cloak-room accommodation* to the boys', girls', and infants' departments, of the Horsham East Parade Council Schools. Plans, specifications and conditions of contracts may be seen, and forms of tender obtained at the offices of C. H. Burstow, architect, No. 6, West Street, Horsham. Tenders, sealed and endorsed "Tender for Extension at East Parade Council Schools," to be addressed and delivered to L. Thompson, secretary, Education Offices, West Street, Horsham, not later than 12 o'clock noon on Oct. 25.

Oct. 25. London, S.W.—*Alteration and extension of the laundry* at the Workhouse, Swanfield Road, Wandsworth, for the Guardians of the Wandsworth Union. Persons desirous of tendering may inspect the drawings and specification, and obtain a copy of the bills of quantities and form of tender between the hours of 10 a.m. and 4 p.m. (Saturdays until 1 p.m.) upon application at the Guardians' Offices, St. John's Hill, Wandsworth, near Clapham Junction Railway Station, and by depositing with F. W. Piper, clerk, £2. Tenders, upon the form supplied must be signed, enclosed in the envelope provided, and delivered to F. W. Piper, clerk, Union Offices, St. John's Hill, Wandsworth, S.W., not later than 10 o'clock a.m. on Oct. 25.

Oct. 26. Colchester.—*Additions to the administration block* at the Infectious Diseases Hospital, Mile End. Plans may be seen and copies of specifications, quantities, &c., obtained on application to H. Goodyear. A.M.I.C.E., borough engineer and surveyor, Borough Engineer's Office, Town Hall. Sealed tenders, endorsed "Additions, Infectious Diseases Hospital," to be delivered to him not later than 10 a.m., Oct. 26.

Oct. 27. Great Burstead.—*Structural alterations and additions* to the Council School, Great Burstead. Plans, specifications, and form of contract may be inspected at the office of F. Whitmore, architect, 73, Duke Street, Chelmsford, between the hours of 10 and 5 o'clock on any working day except Saturday. Builders desirous of tendering must send in their names and addresses to the architect at once, when a copy of bill of quantities will be supplied to each applicant, if references are satisfactory. Any tender accepted must be subject to the approval of the Local Government Board. Sealed tenders, endorsed "Tender for Great Burstead School Alterations," should be sent to F. W. Bittles, clerk, Brentwood, not later than Oct. 27.

Oct. 29. Farnworth.—*Erection of a new public elementary school* in Plodder Lane, Farnworth. Bills of quantities may be obtained on written application to H. Rostron, secretary of education, Education Office, Darley Street, Farnworth, near Bolton, by payment of a deposit of £1 1s. Fair wages clause. Tenders must be delivered before 12 o'clock noon on Oct. 29, sealed and endorsed, to the Secretary.

Oct. 29. Leeds.—*Erection of proposed alterations and additions to works* and offices for Frank Horsell & Co., Ltd., Holbeck, Leeds. Contractors desirous of tendering are requested to forward their names to J. B. Fraser, architect, Leeds. Drawings and specification can be seen and bills of quantities obtained on payment of a deposit of £1. Endorsed tenders to be delivered to the architect before 10 a.m. on Oct. 29.

Oct. 30. Llanrug.—*Erection of a new chapel* adjoining Pontrhythallt Station for the Llanrug C.M. Chapel Committee. Plans and specification to be seen at the secretary's house, Eryri Terrace, Llanrug, to whom sealed and endorsed tenders are to be sent on or before Oct. 30.

Oct. 30. St. Blazey.—*Erection and completion of shops, stores, and other offices* at Station Road, St. Blazey, for the St. Blazey and District Co-operative Society Ltd. Plans, specifications, and general conditions can be seen, and full particulars obtained at the office of F. C. Jury, architect, No. 1, Alma Villas, Tregonissey Road, St. Austell. Tenders, sealed and endorsed "Shops and Stores Tender," must be sent to W. Foster, secretary, St. Blazey and District Co-operative Society, St. Blazey, Par Station, on or before Oct. 30.

Oct. 30. Exeter.—*Erection of new offices* at Exeter (St. David's) station for the Directors of the Great Western Railway. Plans and specification may be seen, and forms of tender and bills of quantities obtained, at the office of the Engineer at Plymouth (North Road) station, between the hours of 10 a.m. and 4 p.m Tenders, addressed to G. K. Mills, secretary, Paddington Station, London, and marked outside "Tender for Offices at Exeter," will be received on or before Oct. 30.

Oct. 30. Timoleague, Co. Cork.—*Erection and completion of a new Parish Church* at Timoleague, County Cork, according to the plans and specifications prepared by M. A. Hennessy, architect, 74, South Mall, Cork. Copies of the plans and specifications and general conditions of contract may be seen daily at the Parochial House, Timoleague, or at the offices of the architect, South Mall, Cork. Copies of the quantities can be had on application to the architect on payment of £3 3s. Sealed tenders to be addressed to Rev. Peter Hill, P.P., Timoleague, on or before Oct. 30.

Oct. 31. Birkenhead.—*Erection and completion of 18 tenement dwellings* on the east side of Egerton Street. Plan, specification, and particulars can be seen and bill of quantities and form of tender obtained on application at the office of C. Brownridge, M.I.C.E., borough engineer and surveyor, upon a deposit of the sum of £3 3s. Fair wages clause. Tenders upon the printed form supplied, sealed and endorsed "Tender for Dwellings, Egerton Street," to be sent to A. Gill, town clerk, Town Hall, Birkenhead, not later than 12 o'clock noon on Oct. 31.

Oct. 31. Rye.—*Erection of new Grammar School,* Rye. Persons desirous of tendering are requested to send their names and addresses to E. J. Cory, High Street, Rye, Sussex, from whom full particulars can be obtained. Tenders must be delivered not later than Oct. 31, to W. Dawes, clerk to Governors, Bank Chambers, Rye.

Oct. 31. London, W.—*Alterations and additions at No. 96, King Street,* Hammersmith. Plans of the intended works may be seen and a copy of the specification, with form of tender, can be obtained on application to H. Mair, M.I.C.E., borough surveyor. Sealed tenders, endorsed "Tenders re No. 96, King Street," to be delivered to H. Thompson, town clerk, Town Hall, Broadway, Hammersmith, W., not later than 6 p.m. on Oct. 31.

Nov. 1. Blawith.—*Alterations and additions to the residence* known as Brown Howe, also to lodge and farm buildings, situate at Blawith, near Greenodd, for Sir Robert A. Hampson. Plans and specifications may be seen on application to the gardener at Brown Howe. Sealed and endorsed tenders to be sent to W L. Mason, F.R.I.B.A., architect, Ambleside, not later than noon on Nov. 1.

Nov. 5. Odiham.—*Alterations* at the Odiham Police Station. Persons desirous of tendering may see plan, specification, and conditions of contract, and obtain bills of quantities and all necessary information at the office of W. J. Taylor, county surveyor, the Castle, Winchester, on and after the 22nd Oct., between the hours of 9 a.m. and 5 p.m. (Saturdays 9 a.m. and 1 p.m.). A deposit of £2 2s. will be required for a copy of the bills of quantities. Deposits must be made by cheque payable to Hants County Council, and crossed "Bank of England," or particulars will not be sent. Tenders, endorsed "Proposed Alterations, Odiham Police Station," are to be delivered to H. Barber, clerk of the County Council, the Castle, Winchester, on or before Nov. 5.

Nov. 5. Dublin.—*Erection of a stationmaster's house* at Sixmilecross Station, for the Directors of the Great Northern Railway Co. (Ireland). Parties wishing to tender for the work can see the drawing and specification at the office of W. H. Mills, engineer-in-chief, Amiens Street, Terminus, Dublin, or copies of them at the office of the District Engineer, Belfast, and forms of tender can be obtained at either of the above-mentioned places on payment of 1s. each. Tenders, made out on the forms supplied by the Company, and endorsed, "Tender for Stationmaster's House," should be delivered to T. Morrison, secretary, Secretary's Office, Amiens Street Terminus, not later than 10 a.m. on Nov. 5.

Nov. 6. Mile End, Essex.—*Foundations of the main building* of the new second asylum, near Colchester, to be erected at Mile End, about 1½ miles north of Colchester main-line railway station. Persons desirous of tendering for the work may see the plans, specification, agreement, &c., at the County Asylum Office, 4, Duke Street, Chelmsford, between the hours of 10 and 4 o'clock (except Saturdays), when they will be on view between 10 and mid-day. Contractors must send in their names and addresses at once to W. P. Gepp, clerk to the Visiting Committee, Chelmsford, with a deposit of a cheque or Bank of England note of £20, when a copy of the quantities will be sent. Security to the amount of £2,000 for the due execution of the work must be given as the committee may require by and at the expense of the contractor. Sealed tenders, endorsed "Tender for Foundations, New Second Asylum, Colchester," to be delivered to W. P. Gepp, at his office, not later than Nov. 6.

No date. Salford.—*Excavators and concrete work* to increase the height of the banks of a reservoir at the Broughton Dye Works, Salford, for the Winterbottom Book Cloth Co., Ltd., Salford. Copy of bills of quantities can be obtained on application to Stephen Kemp, 6, Princess Street Manchester.

No date. Leeds.—*Erection of an additional Class-room* at the Cross Stamford Street Council School. Contractors desirous of tendering for the whole of the works are requested to apply to W S. Braithwaite, Architect, Education Offices, Leeds, when quantities will be forwarded by them.

No date. Conon.—*Rebuilding of Rose Cottage,* Conon. Contractors desirous of tendering for the various works in connection with this are requested to lodge their names with Cameron & Burnett, architects and ordained surveyors, Academy Buildings, Inverness, from whom schedules of quantities and all other information are to be obtained.

No Date. Foyers.—*Erection of proposed block of shops* and dwelling-houses at Foyers for The British Aluminium Company, Ltd. Contractors desirous of tendering for the various works in connection with the above, are requested to lodge their names with Cameron & Burnett, architects and ordained surveyors, Academy Buildings, Inverness, from whom schedules of quantities and all other information are to be obtained.

No date. Kendal. *Pulling down a wing* and alterations and additions at Eller Bank, Kendal, for William Taylor. Esq. There will be a quantity of good building materials, all in new condition, which will become the property of the contractors. Bills of quantities and all particulars on application to S. Shaw, F.R.I.B A., architect.

ENGINEERING.

Oct. 20. Sudbury, Suffolk.—*Supply and fixing of a Cornish boiler* 12ft. in length by 5ft. 6in. diam., suitable for a daily working pressure of 80lb. to the sq. in., fitted with double deadweight safety valve, blow-off cock, stop valve, steam gauge, water gauges and fittings, fusible plug and manhole, damper, frame, two soot doors, cover-plate and bearers for blow-off pit. Present boiler and setting to be removed and allowed for. Specification will be on view at the Union Workhouse, where site can be inspected, between the hours of 9 a.m. and 5 p m., or copies may be obtained from H. C. Canham, Clerk to the Guardians, 68, Friars Street, Sudbury, Suffolk, upon payment of the sum of £1 1s. Tenders to be sent to him on or before noon on Oct. 20.

Oct. 22. Pontypridd.—*Supply, delivery, and putting to work* of about 2,205 yds. of 75 Single Traction Return and Pilot Cable, Paper Insulation, for the U.D.C. Specifications, general conditions, and form of tender may be obtained on application to J. E. Teasdel, A.M.I.E.E., electrical and tramways engineer, upon payment to J. Colenso Jones, clerk to the Council, Municipal Buildings, Pontypridd, of a deposit of £2 2s. Tenders on the prescribed form, sealed, and endorsed "Tender for Cable," must be received by the Clerk to the Council, on or before Oct. 22.

Oct. 23. Italy.—*Supply of electric cable and insulated wire to the Italian Navy*, to the estimated value of 40,000 lire (about £1,600), for the British Vice-Consul at Spezia, E. M. de Garston. Tenders are to be opened at the Royal Arsenals of Spezia and Naples at 11 a.m. on Oct. 23. A deposit of 4,000 lire (about £160) will be required to qualify any tender. The special conditions of contract may be seen at the Ministry of Marine, Rome, at the Directorates-General of the Royal Arsenals at Spezia and Naples, at the Technical Offices of the Navy, Genoa, and at the principal Chambers of Commerce in Italy. Each tender should be made out on Government stamped paper of one lira, which may be obtained from the Italian Consulate-General in London, 44, Finsbury Square, E.C. Local representation is necessary. The Vice-Consul adds that competitors must produce proof that they are genuine manufacturers of electric cables and wires.

Oct. 23. Belgium.—*Construction of further sections of the railway* from Hannut to Huccorgne on the local railways from Hannut to Vinalmont and Burdinne to Huy. The estimated cost of the work is 185,219 fr. (£7,409), and a deposit of 18,000 frs. (£720) is required to qualify any tender. Tenders by registered letter will be received at the offices of the "Société," at 14, Rue de la Science, Brussels, not later than Oct. 23. A copy of the specifications may be obtained on payment of 1 fr. from M. Mahieu, rue du Moulin No, 3, Waremme.

Oct. 23. Manchester.—*Strengthening of Philips Park Road Bridge* over the Ashton Canal. Drawing may be seen and specification, bill of quantities, and form of tender obtained on application to the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope and addressed to the Chairman of the Improvement, &c., Committee, to be delivered at the City Surveyor's office not later than 10 a.m. on Oct. 23.

Oct. 24. Portsmouth.—*Repairing two boilers* at the Eastney Pumping Station, in the borough of Portsmouth. The specification may be seen and a form of tender obtained at the Borough Engineer's Office at the Town Hall. The form of tender is to be completely filled in, and sent under cover to reach A. Hellard, town clerk, Town Hall, Portsmouth, not later than 10 a.m. on Oct. 24. Fair wages clause.

Oct. 27. Heckington.—*Sinking and boring an artesian well* to a total depth of 300ft. or thereabouts, at Heckington for the Sleaford R.D.C. Specifications, schedules, and all other information may be obtained at the office of the Engineer and Surveyor to the Council, W. B. Marsden. 74, Southgate, Sleaford, who by appointment will visit the site with contractors. Tenders, endorsed "Tender for Heckington Water Supply," to be addressed to E. Clements clerk to the Council, 74, Southgate, Sleaford, and sent in on or about 6 o'clock p.m. on Oct. 27.

Oct. 29. Beckenham.—*Supply and erection of an induced draught apparatus* in connection with the Electric Light and Destructor Works, for the U.D.C. Plans, particulars and forms of tender, obtained on application to J. A. Angell, surveyor to the District Council, or J. E. Tapper, electrical engineer, on the production of a receipt from the collector (who attends his office daily from 9 to 10 a.m. only, except on Tuesdays, when his hours are from 9 a.m. to 1 p.m.) for a deposit of £1. Tenders duly sealed and endorsed "Tenders for Induced Draught Apparatus," to reach F. Stevens, clerk of the Council, not later than 4 p.m., Oct. 29.

Oct. 29. Linares.—*Lighting by gas or electricity* the town of Linares. Tenders combining these two systems will also be admitted. The number of lights required will be as follows:—700 lights of 30 candle power, 200 lights of 10 candle power, and 4 lights of 500 candle power. The upset price the municipality will pay is 42,000 pesetas annually. Tenders will be received up to Oct. 29, at the Secretaria del Exemo, Ayuntamiento de Linares, as well as at the Direccion de Administracion, Madrid. Further particulars with regard to the conditions attaching to the contract are contained in the *Gaceta* of Sept. 22, which may be seen at the Commercial Intelligence branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Oct. 29. Erith.—*Supply and erection of* the following plant for the U.D.C.:—Contract No. 1—Water storage tank and supports, water purifying and softening plant, steam feed pump and pipework. Contract No. 2—Removal and re-erection in new building of existing condensers and feed pumps, &c., and pipework. Persons are at liberty to tender for one or both contracts, but not for part of one contract. Copies of the specifications with forms of tender, general conditions and plans may be obtained from C. H. Fry, clerk to the Council, Council Offices, Bexley Road, Erith, on depositing the sum of £5. Plans and specifications can be seen, but not obtained, at the offices of Hawtayne & Zeden, consulting engineers to the Council, 9, Queen Street Place, London, E.C. Tenders sealed and marked "Tender for Electricity Supply Works Extensions," to be addressed to C. H. Fry, and delivered on or before 12 o'clock noon, on Oct. 29.

Oct. 30. Norway.—*Supply and erection of about 35 tons of iron bridge work* for the Norwegian Government Commission of Roads and Bridges. Tenders, in sealed envelopes, marked "Anbud paa Jernfagvaerksbro" are to be delivered at "Veidirektorens Kontor, Akers Gade 42lv, Christiania," by midday on Oct. 30. Copies of the general conditions of tender to the Norwegian Government, and the special conditions, form of tender, and specification for the above contract, may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

Oct. 31. Pontevedra.—*Supplying electric light* to the town of Pontevedra for a period of 15 years from 12th April, 1908. The upset price the municipality will pay is 20,000 pesetas annually. Tenders will be received up to 11 a.m. on Oct. 31, at the Palacio Municipal, Pontevedra, and at the Direccion General de Administracion Local at Madrid. The *Gaceta* of Sept. 21 contains further information as to the terms of the contract, as well as a copy of the form of tender, which may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Nov. 5. Portsmouth.—*Supply, provision, erection, setting to work, and maintenance* of electrically-driven centrifugal storm water pumps, with their switchgear and the accessaries of the whole or any of them, to be erected in an underground pumping station to be built on Southsea Common. Specifications and forms of tender may be obtained from the Town Clerk on payment of a sum of £2 2s., and the drawings may be seen and full information supplied upon application at the offices of Bramwell & Harris, 5, Great George Street, Westminster, S.W. Tenders under seal and endorsed "Tender for Works for the Prevention of Storm Water Flooding in the low lying area of Southsea.—Contract No. 1," must be delivered to Hellard, town clerk, Town Hall, Portsmouth, on or before 12 o'clock on Nov. 5.

IRON AND STEEL.

Oct. 19. Chichester.—*Supply of 1,650 yds. of 5-in. cast-iron pipes*, to be supplied in 9ft. lengths, in accordance with specification. Delivery at Chichester Railway Station, L.B. & S.C. Ry. Drawings may be seen, and specification and bill of quantities, and form of tender obtained at the office of F. J. Lobley, A.M.I.C,E., city surveyor, Council House, Chichester. Sealed tenders, endorsed "Tender for Water Mains," must be received by J. W. Loader Cooper, town clerk, Chichester, not later than noon on Oct. 19.

Oct 22. Spain.—*Supply of cast-iron and forged pieces* to the value of 14,000 pesetas, for the use of the Administration of the Quicksilver Mines at Almaden. Tenders will be received, up to October 22, at the Direccion de las Minas de Azogne de Almaden.

Oct. 24. Norway.—*Supply of round rods of rolled steel* ("flussjern") as follows:—

Diameter.	Length.	Number.
(*a*) 150 mm.	5·2 m.	about 80
(*b*) 105 ,, ...	5·0 ,, ...	,, 30
(*c*) 105 ,, ...	5·6 ,, ...	,, 80
(*d*) 105 ,, ...	6·3 ,, ...	,, 10
(*e*) 105 ,, ...	1·6 ,, ...	,, 10

for the Norwegian Government Lighthouse Authorities. Tenders, stating price per 1,000 kilograms, will be received at "Fyrvæsenets Kontor, Wergelandsvei, Christiania," up to mid day on Oct. 24. Copies of the general and special conditions of tender (in Norwegian) may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C. Apart from the usual customs duties, a preference of from 10 to 15 per cent. is given to Norwegian manufacturers. In all cases of Norwegian Government contracts it is obligatory that a resident agent should act for tenderers not residing in Norway, and be responsible to the Government, but it is not necessary for the agent to be a Norwegian firm.

PAINTING AND PLUMBING.

Oct. 19. Walton.—*Painting* at Walton Workhouse. Specification to be seen at the Workhouse, Rice Lane, Walton. Tenders to be sent to H. P. Cleaver, union clerk, Union Offices, Brougham Terrace, Liverpool, not later than 9 a.m. on Oct. 19.

Nov. 1. Monkwearmouth.—*Painting* of the Monkwearmouth Car Depot. Specification and form of tender may be obtained on application to the General Manager, at his office, Wheat Sheaf Corner, Monkwearmouth. Tenders in a sealed envelope, endorsed "Tender for Painting Monkwearmouth Car Depot," must be delivered to F. M. Bowey, town clerk, Town Hall, Sunderland, not later than 12 noon on Nov. 1.

ROADS AND CARTAGE.

Oct. 18. Croydon—*Making-up of the following Streets* within the district of the R.D.C.:—Plough Lane (part of), Caithness Road, Quinton Avenue, Edna Road, Grand Drive (part of), Oxford Road, Grosvenor Road, Grosvenor Gardens, Marchmont Road. Avenue Road, Stanley Gardens. Specification and form of tender can be obtained and the plans can be inspected at the office of the Surveyor to the Council, R. M. Chart, F.S.I., the Town Hall, Croydon, on payment of £2. Tenders to be delivered to E. J. Gowen, clerk, Town Hall, Croydon, on or before 12 o'clock noon on Oct. 18.

Oct. 18. Southend-on-Sea.—*Making-up of the following streets:* Surbiton Road (part of), Fernbrook Avenue, Oakleigh Avenue, Brighton Avenue, Beedell Avenue (part of), Fleetwood Avenue (part of), Woodfield Road. Plans, sections, and specifications may be seen and bills of quantities and forms of tender obtained (on deposit of cheque for £1 1s. in respect of each street), upon application to E. J. Elford, M.I.M.E., Borough Surveyor. No tender will be considered unless made on the prescribed form, and there must be a separate tender for each street. Sealed tenders, endorsed with the name of the street and marked "Tender for Private Street Works," to be delivered to W. H. Snow, town clerk, Town Clerk's office, Southend-on-Sea, before 12 o'clock noon on Oct. 18.

Oct. 23. Barking.—*Supply of 500 cubic yards of 2-in. gauge* and 250 cubic yards of 1½in. gauge hand broken Guernsey granite, delivered alongside the Council's Wharf. Barking Creek, for the U.D.C. Full particulars and form of tender can be obtained upon application to C. F. Dawson, surveyor to the Council, Public Offices, Barking. Tenders are to be sent to H. Hargreaves, clerk to the Council, Public Offices, Barking, marked on the outside "Tender for Broken Granite," before 12 o'clock noon on Oct. 23.

Oct. 24, Woodstock.—*Supply of stone* of each or either of the Hartshill, Clee Hill, Leicestershire granite, and Rowley Regis stone, qualities at per ton, for the R.D.C.—viz., Best handpicked unbroken stone; best broken stone, 2 in. gauge, clean and free from chippings; best double-screened nuts for patching purposes, 1½-in. gauge; best double-screened coarse chippings, and best finest chippings and binding chippings. The stone is to be delivered to the Council at the undermentioned wharves, on the Oxford and Birmingham Canal—namely, Aynho, Somerton, Heyford, Enslow, Thrupp Landing, angford Lane, Kidlington Bridge, King's Bridge and Wolvercote; and at the undermentioned railway stations —namely, Aynho, Somerton, Heyford, Bletchington, Handborough, Woodstock, Bloxham and Kidlington. The stone is to be delivered at the dates and places and in the quantities to be specified in the surveyor's written orders, to be sent by post to the stone contractors, and the whole of the stone is to be supplied before Oct. 1, 1907. A person tendering, if his tender is accepted, will be required to sign a written agreement to supply the stone in accordance with the terms of this advertisement and the surveyor's orders. Tenders and samples must be delivered to A. G. Higgs, clerk to the District Council, Woodstock, in Woodstock on or before Oct. 24. Wharfage and railway charges are payable by the stone contractors,

SANITARY.

Oct. 22. Dublin.—*Supply of two four-stall urinals*, made of cast-iron, and fitted with white enamelled fireclay stalls, between the upright iron divisions. Intending contractors are required to furnish a trace plan, giving thereon figured dimensions showing the exact class of urinal which they propose to supply for the price quoted; also a detailed description of the urinals and fittings. The contractor whose tender is accepted shall deliver the urinals, which will be erected by the Corporation staff, to the Waterworks Yard, Fishamble Street. Tenders addressed to the Chairman, Improvements Committee, City Hall, Dublin, and endorsed "Tender for Urinals," must be received by P. Tobin, secretary, Improvements Committee, City Hall, not later than 12 o'clock noon on Oct. 22. The work to be executed under this contract shall be done entirely by local labour, and where this is considered impracticable, the contractor shall apply to the Municipal Council for permission to have the work done by other than local labour. The workshops, factories, and other places used by the contractor in the execution of the contract shall be open to inspection at any time during working hours by a duly authorised representative of the trade affected by such contract, upon the production of a permit signed by the Town Clerk or other officer appointed by the Supplies Committee of the Corporation.

Oct. 29. Waterloo.—*Supply and delivery of cast-iron piles*, and about 2,000 yds. of cast-iron pipes for sewerage work for the Waterloo-with-Seaforth U.D.C. The drawings may be seen and specifications, bills of quantities, and forms of tender obtained on application to F. Spencer Yates, Assoc.M.Inst.C.E., the surveyor to the Council, at the Town Hall, Waterloo on payment of a deposit of £1 1s Sealed tenders, on forms supplied, endorsed "Tender for Cast-Iron Pipes," and addressed to the Chairman of the Health Committee, are to be delivered at the Town Hall, Waterloo, not later than 12 o'clock noon on Oct. 29.

Oct. 30. Uttoxeter.—*Provision laying and jointing* of about 2,800 yards of 9in. stoneware pipe sewers, together with manholes, lampholes, and other incidental works for the Uttoxeter U.D.C. Plans and specifications may be seen at the offices of Willcox & Raikes, engineers, 63, Temple Row, Birmingham, from whom bills of quantities and form of tender may be obtained on payment of a deposit of £2 2s. Sealed tenders, in envelopes supplied, endorsed "Uttoxeter Sewerage Extension," to be delivered to F. S. Hawthorn, clerk to the Council, Market Place, Uttoxeter, not later than Oct. 30.

MISCELLANEOUS.

Oct. 18. London, E.C.—*Supply of the following stores:* Wheels and axles; bearing springs; helical and volute springs; steel fishbolts, nuts and washers; Sheffield tools; bolts, rivets, coach screws and spikes; zinc sheets, &c., for the Great Indian Peninsula Railway Company. Specifications and forms of tender may be obtained at the company's offices, 48, Copthall Avenue, E.C., London, on payment of the fee for the specification. Tenders must be delivered in sealed envelopes, addressed to J. I. Berry, secretary, Company's Offices, marked "Tender for Wheels and Axles," or as the case may be, not later than 11 o'clock a.m. on Oct. 18.

Oct. 18. Belgium.—*Supply of 2,400 metres of electric cable* for a 120-ton shear for the municipal authorities. The specification (*Cahier des Charges*, No. 1,163) relating to the contract may be obtained from the Hotel de Ville, Antwerp. All tenders should be sent in sealed registered envelopes, addressed "A Monsieur le Bourgmestre de la ville d'Anvers." and should reach the Hotel de Ville not later than Oct. 18. A deposit of £20 is required to qualify any tender. A copy of the specification may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Oct. 20. Manchester.—*Supply of* (a) such quantity of glazed earthenware sewer pipes, &c., as they may require during the ensuing twelve months; (b) pitch and creosote oil, for the Paving, Sewering and Highways Committee of the Manchester Corporation. Forms of tender may be obtained on application to the Chief Clerk, Paving, &c., Department, Town Hall, Manchester. Tenders must be received by Oct. 20.

Oct. 23. London, S.W.—*Supply of bridgework*, 30, 40, and 60-ft. spans. The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 p.m. on Oct. 23.

Oct. 29. London, W.—*Supply* of the following stores from the 1st of Dec. next to the 30th of Nov., 1907, for the Directors of the Great Western Railway Co.:—Bricks; lime, plaster of paris, and cement; stone, artificial stone paving, slates, drain pipes, and crucibles; firebricks and fireclay; colours, paints, white and red lead, &c.; varnishes; zinc, antimony, brass, copper rivets, &c.; tin plates; wire—iron and steel; rivets, bolts and nuts, &c.; fishplates, and bolts and nuts for permanent way; nails, screws, &c.; eaves, gutter, stack pipe and fittings; locks; steel tools (files, saws, shovels, &c.); platelayers' tools; ironmongery—general: brasswork—builders' and general for railway carriages: pressure gauges and water fittings; brass gasfittings; galvanised goods; sanitary ware and fittings; fencing and gates. Samples and patterns may be seen at the General Stores, Swindon, from Oct. 17 to Oct. 25, on application at the office of the Stores Superintendent, Swindon, at the following hours:—Monday to Friday, 10 a.m, to 5 p.m.; Saturday, 10 a.m. to 12 noon. Specifications and forms of tender (upon which alone tenders can be received), may be obtained at the office of the Stores Superintendent at Swindon. Tenders addressed to G. K. Mills, secretary, Paddington Station, London, and marked outside "Tender for Stores," will be received on or before Oct. 29.

Oct. 30. Egypt.—*Supply of ironmongery fittings* for buildings and for furniture for the Egyptian State Railways. Tenders, accompanied by a stamped paper of 30 millièmes, should be placed in sealed envelopes marked "Tender for the Supply of Ironmongery," and addressed to the General Manager, Egyptian State Railways, Cairo, where they will be received up to noon on Oct. 30. Copies of the conditions and form of tender (price 4s.) may be obtained from Lieut.-Col. Western, R.E., C.M.G., Queen Anne's Chambers, Westminster, S.W., where also samples may be seen. A copy of the conditions may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

Oct. 30. Netherlands.—*Supply of*, for the Company for Exploitation of State Railways:—Contract 220.—530,000 steel plates. Contract 221.—15 metric tons of steel "tirefonds," 610 metric tons of screw, hook, and other descriptions of bolts. Contract 222.—230,000 fir sleepers. Contract 223.—36,000 oak or beech sleepers. Contract 224.—Oak or beech sleepers for bridges, and timber for points, Tenders should be delivered at the Central Bureau of the Company, Moreelse Park, Utrecht, before 2 p.m., on Oct. 30. Copies of the contracts may be obtained at the said Bureau (1st Department, "Dienst Weg en Werken") on payment of Fl. 0·50 (10d.) per contract.

TOO LATE FOR CLASSIFICATION.

Oct. 30. Rhondda.—*Alterations and additions to the Isolation Hospital*, Ystrad, Rhondda, including the erection of a pavilion, combined convalescent and discharging block, and additions to the present administrative block, laundry, and stable blocks for the U.D.C. Plans and specification may be seen and bills of quantities and tender forms obtained at the office of W. D. Morgan, architect, Post Office Chambers, Pentre, upon the production of a receipt for a deposit of £2 2s. from the accountant of the Council, which can be obtained at the Council Offices, Pentre. Fair wages clause. Sealed tenders, endorsed "Tender for Hospital Extensions," must be delivered before noon on Oct. 30, at the Council Offices, Pentre, Rhondda, addressed to "The Chairman of the Health Committee, Rhondda U.D.C."

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.

October 17, 1906.

CONTRACTORS' SUPPLEMENT (MONTHLY).

LABOUR IN THE COLONIES.

The October circulars of the Emigrants' Information Office, of 31, Broadway, Westminster, S.W., reporting upon the present prospects of emigration, as regards building trade employees, state:—

In Canada work in railway construction has been very brisk. It is too late in the year for the ordinary emigrant to go there now, unless he goes to friends or has enough money to live on during the winter. The plumbers' strike at Winnipeg still continues.

As regards the Commonwealth of Australia, reports from several places in New South Wales show that there is practically no demand for more labour of any kind. At Young, however, there is a good demand for general labourers, and a fair one for a few carpenters, joiners, bricklayers, stonemasons and blacksmiths. In Victoria, men in the building trades have been wanted at Bendigo. In South Australia, Queensland, and Western Australia there is no demand for more labour.

In New Zealand, men in the building, engineering, clothing, and boot trades, and in the saw-mills, have been generally busy, and in some places there has been a difficulty in procuring competent men.

Men in the building trades especially are warned against going to Cape Colony. Bricklayers' labourers are coloured men, as well as large numbers of bricklayers and plasterers.

In Natal there is a plentiful supply of skilled and unskilled labour, and no more is wanted.

Persons are warned against going to the Transvaal at the present time in search of work, as the local supply of all kinds of labour is more than sufficient. The building trades at Johannesburg are bad, and large numbers of masons, carpenters, bricklayers, plasterers and others have left the country through inability to obtain employment. Owing to this exodus there is a large number of empty houses, which fact has the double effect of lowering rents and stopping further building operations.

In the Orange River Colony there is no demand whatever for labour.

A NATIONAL CO-OPERATIVE BUILDINGS SOCIETY.

The latest industrial project is the establishment of a National Co-operative Buildings Society, which shall carry out contracts of all kinds for the erection of buildings of every description, the profits being devoted to extension, and to the formation of a political fund, out of which the expenses of running candidates for municipal and Parliamentary seats will be defrayed. A circular upon the matter has been sent to every trade union and branch of a union associated with the building industry, and committees are to be formed for Scotland in Glasgow, for England in London, Wales in Cardiff, and in Ireland at Dublin or Belfast. From these local or sectional committees will be formed a committee of ways and means, to devise the best method of raising funds. The project originates with the National Amalgamated Society of Operative House and Ship Painters.

THE PAINTING TRADE.

Commercialism and Craftsmanship.

At the annual conference of the National Association of Master House Painters and Decorators, held at Leeds last week, Mr. E. H. Mattey (Birmingham) contributed a paper on "The Present-day Condition of the Painting Trade—Commercialism and Craftsmanship." Dividing his subject into four sections, Mr. Mattey first touched upon the question of education. In no business, he said, was a working knowledge of the trade more necessary than among master painters; no trade where the personal factor was more needed. A master painter should be a draughtsman, colourist, naturalist, chemist, organiser, mathematician, and a gentleman. Were not the workmen what commercialism had made them, and did not the employers too often regard them as "hands," and not men? True commercialism, he went on to say, would insist on the best production. Technical schools and schools of art had been provided by many municipalities, and would do good if rightly used. But he was convinced great sums of money were wasted, rates and taxes being paid away in a shoddy form of instruction, largely, if not entirely, because commercial men had not realised that they should interest themselves in the work carried on. Mr. Mattey went on to suggest the institution of local competitions and exhibitions of work, while local lectures might be given to masters, men and the public. They grumbled, he said, because in competitive work public bodies and private clients too often considered the cost first and the quality afterwards. Cheap labour was one cause of that state of affairs, and he held it should be the business of trade unions to see that capability should be a condition of membership. He held that they should demand of trade unions that they should give them capable men. Mr. Mattey added that there was only one honest way of pricing work, which was that each job should pay its own way. There must be competition, but why should there be this game of beggar-my-neighbour?

Mr. Mattey proceeded to speak of the quality of work, and urged that the public got better value out of an accomplished craftsman than out of a man whose chief asset was ignorance. Public authorities, he held, could do very much to prevent the present system of putting layer upon layer of paper on the walls of dwelling-houses, and covering up the dirt and grime of disease. There was a tendency, too, in some quarters, to use showy, ready-made ornamentation, but he believed the average home was more artistic in its decoration than formerly. This necessitated on the part of the painter an increased knowledge of restraint, fitness, selection, and method, because the simple work was often more difficult to perfect.

Builders' Notes.

The creditors of Hackney Joinery, Limited, are required, on or before October 25th, to send their names and addresses, and the particulars of their debts or claims, and the names and addresses of their solicitors (if any), to Mr. Herbert G. Middleton, of 31, Preston Road, Leytonstone, the liquidator of the company.

The Yorkshire Building Trade.—Mr. P. H. Bagenal, District Inspector of the Local Government Board, in addressing the Ripon Board of Guardians, said that reports received from relieving officers in large and small towns showed that the building trade had never been in so bad a condition for 25 years. That hit workmen such as joiners, carpenters, plasterers, and bricklayers' labourers.

Manchester Bricklayers' Dispute Settled.—After a month's idleness a settlement has been arrived at in the dispute between Messrs. R. Neill & Sons, builders, Manchester, and their bricklayers. The men employed in the erection of the Prestwich Union Infirmary, at Blackley, claimed walking time, on the ground that the site was outside the two miles' radius, but Messrs. Neill declined to pay, on the contention that as the men had been engaged on the spot the rule did not apply. The result was that the men were withdrawn from that and other jobs in the district, and a number of others were brought from different parts of the country to fill the vacant places. As the result, however, of a conference, Messrs. Neill & Son have agreed to concede the men's claim.

Training Brassworkers. — The brassfounders of Birmingham and district have issued an appeal for funds for the establishment of a municipal trade school for brassworkers. The idea is that the institution should not bring into existence a still greater amount of mediocre ability, but improve that which is already in existence. The ultimate aim, it is pointed out, is not so much the instruction of boys outside the trade as a cultivation of the young men and adults who are already in the workshops. To this end the essence of efficiency would lie in the ability of the teaching staff. It is proposed, if funds permit, to institute scholarships which will enable the more proficient scholars to finish their studies in Paris or Berlin, on the condition that they return to Birmingham for a certain period to impregnate the city with the broader ideas obtained by their travels.

The Month's Trade

Reports by our Special Correspondents.

THE STONE, GRANITE AND MARBLE TRADES.

In these trades the improvement shown in the last few months has continued. The granite trade even has shown some few signs of life, and it is evident that there is a gradual upward movement. Employment in the limestone and sandstone quarries continued good in Weardale and Cumberland, and also in Derbyshire. It was, however, only fair in South Durham, North Wales, and the Plymouth districts; while in the Somerset blue lias quarries employment continued dull.

As regards other kinds of stone, in the Forest of Dean stone quarries employment has been fair; while at Portland it has been moderate. The Bath stone quarries have been slack, while the Pennant stone quarries in the Bristol district have been very badly employed. The sandstone quarries of North Wales secured a fair amount of work. As one would expect from the revival of trade in the Midlands, the Sheffield, Barnsley, and Rotherham quarries, although they were generally working full time before this, received a still further improvement. In Forfarshire short time has had to be resorted to.

The chert quarries in Derbyshire have been well employed, considerable overtime being necessitated to meet the rush of work. The road material quarries in the Gateshead and Clee Hill districts have continued fair, with perhaps a slight improvement.

In the granite quarries employment continued moderate on the whole in Aberdeenshire. In Leicestershire employment was rather worse than a month ago, when it was reported as fair. Employment was good generally in North Wales, and a further improvement was shown in Devonshire and Cornwall.

As regards settmaking, employment continued fair in Aberdeenshire. It continued good at Stoney Stanton, Airdrie, and Glasgow, and was good generally in North Wales. At Rowley Regis employment was moderate through want of stone, though rather better than a month ago. It was bad, and worse than a month ago, at Edinburgh.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of September, 1906, as compared with the same month in 1904 and 1905, are as follows :—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
107,811	101,021	85,526	£120,615	£113,908	£96,261

The great depression existing in the building trade and the resulting falling off in the demand for stone and other materials are held responsible for a substantial decline in the profits of that hitherto very successful concern, the Bath Stone Firms. The amount earned in the half-year to the end of June last was only £9,641, in comparison with £18,508 for the corresponding six months of 1905. The balance brought in is also lower, being £13,481, as against 15,850, so that the amount now available for distribution (£23,123) is £11,233 smaller than the corresponding total. The directors are consequently compelled to curtail the dividend, and to distribute at a lower rate than has been usual of late years, the payment proposed being at the rate of only 8 per cent. per annum, as against 14 per cent. twelve months ago. The balance then remaining to be carried forward is £14,039, as compared with £18,463. The directors express the hope that the present state of things will be found to be temporary, and that a revival in the building trade will not be long delayed. Meanwhile the company may be congratulated upon its strong financial position. It has a general reserve of £20,000, and the total provision made for depreciation, including £4,288 in respect of the past half-year, is £97,722.

THE CLAYWORKING INDUSTRY.

A steady improvement, if somewhat slow in rate, has now been noticeable for the past four months in the brick and tile trades. This is eminently satisfactory, and though the trade is not by any means brisk, and, compared with prosperous former years, might be called depressed, yet there is no reason for grumbling, as the improvement continues. As we have stated before, this continuance suggests that the improvement is more than a seasonable one. In fact, if it were, it should now be somewhat falling off. The building trade is on every hand showing progress, and the brick and tile trades are sharing in the movement. The cotton, engineering and several agricultural districts have had a very prosperous year, and there is a natural reflection in the building trade; consequently we find employment has been good in Oldham, Norfolk, Suffolk, Essex and Wales. In the Tees and Plymouth districts and in South Staffordshire trade has been fair. At Peterborough, although there is a considerable improvement, trade still remains quiet. In the Birmingham district it is bad, though things will shortly improve, as one of the principal brickmakers in Birmingham and the Midlands has secured contracts for the supply of 8,000,000 bricks, which will take two years to complete. At Nottingham the brick and tile trades have been slack and a retrograde movement has taken place. On the whole, however, it is obvious that there is nothing at present to suggest that these trades will suffer another setback.

THE PORTLAND CEMENT TRADE.

Manufacturers of Portland cement continue to be busy, and will begin the winter months with much lower stocks than they had a year ago. Enquiries for export have been less numerous, but they are again showing signs of improvement, and it is to be hoped that this will continue during the winter months, which is usually a depressed time for the manufacturer and his workpeople. We know of several instances of cement being sold during last winter and early spring at lowest prices on record simply owing to large accumulations of stock, and our information leads us to believe that, without exception, these same factories will begin this winter with practically empty warehouses. Diminution of imports and a very large increase in exports have combined to bring this state of things about, and as these causes continue, it is obvious that the manufacturer will enter upon the slack period this year with far less anxiety than for several years past.

The most striking feature in the position continues to be the substantial diminution in the imports of cheap natural cement into the United Kingdom. Month after month these imports have fallen away, and for the nine months to the end of September last at 132,956 tons, they show a diminution of no less than 50,600 tons compared with the same period in 1905. It is a matter that the general community can congratulate itself upon, for it is to the interest of no one but the foreign maker and his agent in this country that constructional work here should be carried out with material that is notoriously unequal to the genuine artificial Portland cement produced at home. In this connection it will be of interest to dealers and consumers alike to be informed that a new building at Haltern in Germany, erected in reinforced concrete, has collapsed on account of the use of Belgian natural cement.

Manufacturers have concluded their contracts with the gas companies for their supplies of fuel for next year, and as we have reason to believe that this has involved a rise of 3s. per ton, buyers of cement may expect to have to pay at least an additional 1s. 6d. per ton for their supplies to cover increased cost of fuel and other supplies, for the manufacturer must secure this in order to preserve his position and without in any way adding to his profit. The building trades unfortunately continue dull, but better times are bound to come if the improvement in practically all other trades continues.

The returns of imports and exports of cement for building and engineering purposes for September, 1906, as compared with the same month in 1904 and 1905 are as follows :—

IMPORTS.

	1904.	1905.	1906.
Tons	22,557	17,116	11,058
Value	£32,609	22,502	14,204

EXPORTS.

	1904.	1905.	1906.
Tons	37,105	38,025	63,283
Value	£60,695	60,087	94,750

THE SLATE TRADE.

The slate trade is one of the few branches of the building trade which does not seem to have received any advantage from the general improvement. Employment in the Welsh quarries is still slack, and, although fair in the Festiniog and Carnarvon districts, is without upward movement. In the Ballachulish (Argyllshire) quarries only five days a week were worked. More expensive slates, as from the Westmoreland and Cumberland districts, continue the even tenor of their way. The foreign slates are also subject to little movement one way or the other, and all share in the general dulness.

THE IRON AND STEEL TRADES.

The past four weeks have shown a continued improvement. Prices have risen slightly. Joists, angles, tees and other shapes which are used in building operations are always affected by the demand for steelwork in the shipbuilding trades, railways, &c., and as the demand in these directions has continued to increase the price of structural steelwork has continued to rise. The German, Belgian and American manufacturers are also extremely busy, and they consequently do not enter our market at all seriously. Thus there is not enough competition to bring prices down, and as the demand seems on the increase both here and abroad, there is every prospect of prices continuing to advance. There has been some labour trouble in the Clyde iron trade during the past month. A strike has occurred, and in some quarters it is thought that it may spread to other districts. This has, however, not affected prices up to the present.

The returns for imports and exports in certain branches of manufactured iron and steel for the month of September, as compared with the same month in 1904 and 1905 are as follows:—

		Imports.			Exports.		
		1904.	1905.	1906.	1904.	1905.	1906.
Puddled Iron	tons	9,025	11,405	6,709	61,678	91,389	143,036
Wrought iron, in bars, angles, rods and sections		7,294	7,520	6,820	9,046	9,584	11,990
Rails		3,676	4,238	190	64,945	45,181	43,506
Steel:—Girders, beams, joists and pillars from Belgium		7,902	8,483	4,892	4,404	3,633	8,037
„ „ „ „ other countries		3,113	2,534	3,746			
Ingots, blooms, billets, slabs, sheet bars, tin plate bars, or similar partly manufactured		49,349	51,935	26,263	—	—	—
Bars, angles, rods and shapes or sections		—	—	—	11,641	15,715	14,835
Galvanized sheets (flat or corrugated)		—	—	—	27,440	36,719	30,310

The Midlands iron and steel trades were led to expect by the returns of sales and the boom in the North of England market that there would have been an increase of wages, whereas the recent return has surprised all by showing reduced sales, and wages have been reduced on the sliding scale. Staffordshire bars do not, however, show any fall in price.

As regards the North of England market, it is asserted that the pig iron trade was never so active, the production and the export never so large, as at present. In manufactured iron and steel, however, trade is not nearly so good.

In Lancashire pig and finished iron remains unmoved, but steel is quieter.

In Scotland pig and finished iron is active; though the home demand for steel has fallen off, the export demand has maintained prices, notwithstanding the strike on the Clyde.

OTHER METALS.

The copper market remains as strong as ever. The leading producers are said to be sold out for months ahead. The production is unequal to the demand. The large demands in the American home markets mean that Europe is left to go very short.

The tin market is also active, and no decline in the recent high prices is evident.

Lead has made a big rise in price during the month. In fact, prices have advanced by £1 per ton.

THE IRONMONGERY TRADE.

Employment in the lock and latch trades has been bad at Wolverhampton, and short time has been general. With makers of hollow-ware it has been good. Employment with hollow-ware stampers has been slack at Sheffield. At Birmingham with hollow-ware makers it has continued moderate; and at West Bromwich quiet, with short time.

Employment in the stoves, grates, &c., trades has continued fair at Glasgow and Falkirk. It has been quiet in Essex and slack at Rotherham and Leeds, short time being worked at the latter place.

With nut and bolt makers employment has been good at Winlaton, Dudley, and Darlaston, and in South Wales. With nail and rivet makers at Birmingham it has continued fair. At Blackheath it has continued quiet with rivet makers and fair with wrought nail makers.

Employment in the wire trade has continued good generally. At Glasgow it has remained dull with wire weavers.

The return for imports and exports for September, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Imports.	Tons.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.
Wire nails	2,551	2,645	2,712	£27,862	27,392	27,604
Nails (other than wire nails), screws and rivets	1,013	765	588	15,203	14,042	11,006
Bolts and nuts	307	221	212	5,035	2,783	3,583
Exports.						
Nails, screws and rivets	2,266	1,948	2,072	41,699	38,695	37,880
Bolts and nuts	1,186	1,683	1,687	21,297	30,442	35,388

The Director of Customs in the Sudan recently stated with reference to articles mostly imported into the Sudan:—Galvanised iron (water and oil) tanks find a ready sale, as also safes. Tanks could be utilised for packing purposes with advantage. Good quality brass water-taps are recommended, as at present imports are of very inferior manufacture. A very cheap and inferior quality of iron locks, keys and door knobs is imported at present; good British fittings would find a ready sale.

THE TIMBER TRADE.

London Market in September.

The deliveries of wood in London during September showed an improvement of about 6,000 standards as compared with the corresponding month in 1905. On the face of it this would seem satisfactory enough. A careful analysis of the figures, however, shows a reduction of 2,000 standards in deliveries from the docks, while a full proportion of the heavy September importation has been delivered overside for storage elsewhere. The nett result is a total diminution in deliveries of wood in London of about 15,000 standards for the first three quarters of 1906. The London market, Messrs. Churchill & Sim report, has shown some nervousness owing to the free arrivals, and prices for deals and floorings have been inclined to droop to a small extent in consequence. The redeeming features of the present somewhat unsatisfactory conditions are to be found in the policy of shippers, who are holding what little remains for the fullest prices of the season, and in the difficulty in securing tonnage at recent quotations. The free-on-board trade in the country is in smaller compass, many buyers having satisfied all their requirements, and are only to be tempted by cheap cost and

THE GLASS TRADE.

The glass trade continues fair. Employment with sheet glassmakers and bevellers at St. Helens has been good in the past month. It was also fairly good with glassblowers in London. Plate glass bevellers at Birmingham were only fairly employed.

The returns for imports and exports of glass for the month of September, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Imports.	Cwts.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.
Window and German Sheet, including shades and cylinders	70,985	110,241	96,215	£45,807	65,082	54,724
Plate	31,677	27,541	32,781	35,281	32,660	42,995
Exports.						
Plate	5,046	11,816	15,330	8,165	15,746	20,067

THE PAINT TRADES.

The paint trades continue fair. As regards materials, the returns for imports and exports for September, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Imports.		Quantity.			Value.		
		1904.	1905.	1906.	1904.	1905.	1906.
White lead	Cwts.	23,542	22,710	15,918	£18,777	18,841	15,275
Zinc oxide		132,966	22,524	19,551	99,966	22,398	21,338
Other colours and pigments			118,932	128,009		73,274	76,932

Zinc oxide		112,812	5,258	9,446	134,738	5,897	11,168
Other colours and pigments			110,841	115,564		150,499	149,915
Linseed oil	Tons	2,677	2,316	2,280	51,354	47,258	54,035

THE WALLPAPER TRADE.

The wallpaper trade shows little or no movement. The Board of Trade returns of exports and imports for the nine months of this year ending September 30th show that the importation of paperhangings is nearly 20% greater than last year; the exports have improved less—namely, about 7% better than last year, and about 6% better than 1904.

The following is the return of paperhangings for September issued by the Board of Trade:—

Imports.	1904.	1905.	1906
Cwts.	—	2,151	2,218
Value	—	£6,693	6,437
Exports.	1904.	1905.	1906.
Cwts.	5,062	7,498	8,923
Value	£12,077	16,902	17,082

freight quotations, which, in the state of the market, are not forthcoming. This applies rather to the Swedish than to the Russian side, where shippers have met the market rather more freely, perhaps to the extent of selling at summer prices with only part of the high autumn freights in addition.

Messrs. Denny, Mott & Dickson's report is as follows:—"The good tone underlying business in August was well maintained in September, although the rise in the value of money tended to contract forward business. The great feature, however, in the present position is that shippers, whilst benefiting by the increased f.o.b. values, leave little room for profit to the importers on this side, who naturally are feeling the higher cost and smaller percentage of profit which at first accompanies a general rise in values."

The abstract of dock stock, consumption, etc., for September, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on September 30th was:—

	Pieces.
Foreign deals and ends - - -	1,930,000
Do. battens - - - -	2,525,000
Pine deals and battens - - -	794,000
Spruce do. do. - - -	848,000
Boards, rough - - - -	3,827,000
Do. prepared - - -	6,629,000

totalling 16,553,000 pieces, as against 17,890,000 in 1905, 19,365,000 in 1904, and 20,546,000 in 1903.

In other kinds the stock was as follows:—

Foreign wainscot logs - -	268	pieces.
Do. oak timber - -	3,402	loads.
Do. fir timber - -	3,765	do.
Do. Oregon pine, &c., spars and masts - -	4,490	do.
Colonial oak timber - -	2,413	do.
Do. birch timber and planks -	6,665	do.
Do. elm and ash timber -	1,046	do.
Do. yellow pine - -	718	do.
Do. red pine - - -	209	do.
United States pitch-pine timber	16,755	do.
Do. do. deals -	90,000	pieces.
East India teak - - -	7,695	loads.

Deliveries.

The deliveries have been—

	First nine months. Pieces.	September. Pieces.
Foreign deals and ends -	2,322,000	281,000
Do. battens - -	3,661,000	351,000
Pine deals and battens -	732,000	75,000
Spruce do. do. -	809,000	77,000
Boards, rough - -	3,619,000	360,000
Do. prepared - -	10,026,000	1,022,000
Total - -	21,169,000	2,166,000

The deliveries direct from ship to craft have been—

	First nine months. P.s.h.	September. P.s.h.
Deals and battens - -	94,376	21,725
Boards - - -	18,217	3,026
Total - -	112,593	24,751

Soft Woods.

Swedish Deals and Battens.—The importation of deals was considerable during the month, and prices are not quite maintained in consequence. The London demand seems to run more and more towards battens and scantlings, of which a full supply was shipped here in September. Prepared boards have fallen a point or so, and the market cannot be called so strong as it was a month ago. The stock of these is not heavy, and the cost of fresh supplies, coupled with the higher tendency of freights, should make this easing in the values quite temporary.

Norwegian Boards.—A nominal supply of prepared boards arrived during the month. Prices, except for some few sizes, were inclined to go back to a small extent owing to the fears of a heavy autumn importation, which do not look like being realised.

Russian Deals. —Russia sent us a large supply of deals, battens and boards during the past month, but buyers have learnt the unwisdom of leaving their chartering arrangements till autumn rates and insurances make their stocks look too costly, and a considerable number of cargoes usually shipped in October made their appearance here somewhat earlier in consequence. A good demand awaited the large shipment of battens, but deals have been disappointing, and prices difficult to maintain.

Finnish Battens and Boards.—Finland sent us a full share of the larger September importation, and it has mostly been in sizes which are wanted. Prices, except for deals, have been steady, and battens have maintained the August rise, but the somewhat larger supply of them has checked any further upward movement for the present.

Prussian Timber.—A few logs of fit timber arrived during the month for special work, and the stock in the docks has been reduced, but is ample for all present demands. A curious feature of the market is the preference given to sawn pitch-pine, thus reversing the position of a few years ago. The intrinsic value of fir timber and the present lower cost, as compared to the American wood, should, however, gradually have some effect on the demand for it. A little more life is shown in the market for oak, but the demand has been running on cheap logs and not on those of prime quality.

Canadian Timber. — September again brought a small supply of pine deals to London, and only an average quantity of spruce. The stock of pine deals, though small, seems quite sufficient for the poor enquiry for them. The cost of deals of reliable quality seems to keep on growing year by year, rendering the trade in them slower and more retail in character as the prices advance. The demand for spruce has been disappointing, and the stock in the docks is higher in consequence. A light importation from the Lower Ports helped Quebec deals to a certain extent, but the market is hesitating and lifeless. In any case there seems no chance of lower prices for further supplies this season, so that a little elasticity in the enquiry would soon have an effect on values. Birch planks have been in fair demand at the reduced prices caused by a little too much stock coming forward. Elm and ash are unchanged, but the stock of oaks is heavier, and yellow pine somewhat lighter. The month closed with no addition to the stock of sawn timber, and a consequent diminution of stock in London. Prices maintain the August level to which they rebounded after the hesitating conditions of July, and buyers seem now thoroughly frightened at the cost of importing the wood. This rise in values is not artificial, though there is always an element of speculation in these quick changes. The facts seem to point to a steadier market now that a great rise has been established, and it is beginning to be recognised that the world's demand is enormous, and the cost of bringing logs to the shipping ports constantly increasing. The severe hurricane which swept over the Gulf shipping ports will not make prices any easier, but it is too early yet to estimate the damage to the industry, or whether any large quantity of logs have been lost. The London market for pitch-pine deals has been steady, but the high cost is telling on the demand. The importation of them during the month was rather below the average.

Hard Woods.

Teak.—Messrs. Denny, Mott & Dickson report that the landings in the docks in London during September consisted of 731 loads of logs and 464 loads of planks and scantlings, or a total of 1,195 loads, as against 979 loads for the corresponding month of last year. The deliveries into consumption were 341 loads of logs and 311 loads of planks and scantlings—together 652 loads, as against 1,196 loads for September, 1905. The figures show a very moderate, but nevertheless a very welcome addition to the landed stocks both of logs and planks. Seeing that of the total stocks of 7,695 loads a very full third consists of Java wood mostly of unsuitable dimensions, quite irrespective of the conflicting opinion as to the quality of this description of teak, it will be recognised that the scope for selection where picked sizes or quality is required is embarrassingly small.

Mahogany.—This market has been fairly steady, but rather free arrivals of Honduras wood have not tended to strengthen prices, as the consumption, although fairly satisfactory, has not developed in proportion to the supplies. The supply of Cuba wood has been small, and prices for this and other descriptions have been firm.

Odessa Oak.—The stocks on this side are practically exhausted, and the new shipments which should commence about the end of the year are eagerly looked forward to. Fairly good supplies are reported as likely to reach the shipping ports this season, but the enquiries for this specially prepared wood are so numerous that the outget promises to be marketed very rapidly.

ABSTRACT OF STOCK, CONSUMPTION, &C., IN LONDON DOCKS, FOR SEPTEMBER.

Builders' Current Price List of Specialities

This list is not intended to promote undercutting, and prices are subject to discounts for a quantity and for cash. Readers are advised to write for these discounts. Where prices for goods are standardised and fluctuation takes place in trade discounts, our prices have the discounts deducted. In some cases it is difficult for firms to quote prices, and we have stated where they will be pleased to send catalogues and quotations immediately on receipt of applications.

Goods.	Description.	Merchants or Manufacturers.	Address.	Size.	Weight.	Quantity. per	Price

The Grand Manner. On many occasions the subject of street planning and the design of buildings in city streets has been dealt with at congresses of architects, and we do not propose now to refer to the aspect of it which is customarily discussed. The general press has at various times interested itself in the subject, and the "Tribune" has, within the past week, done good service by interviewing well-known architects. Mr. Norman Shaw and Mr. Reginald Blomfield have touched upon the most important quality in the planning of buildings in cities. In the words of Mr. Norman Shaw, "What we want is stateliness—stateliness for an Imperial city. And we shall never do it without a plan, a big, comprehensive plan. Let me tell you how the French do it. In the first place they consult the artists, the people who know. The broad idea of a boulevard or a great street is laid out. It may be a hundred years before it is finished, but the idea runs constantly on. In a dirty little street you come across three or four fine new houses, well set back from the road, and you wonder by what freak they came there. You return in a few years and you find a few more, hundreds of yards away. Then you discover that they are all part of a scheme for a great avenue of the future, an avenue, it may be, half a mile long. We never, by any accident, do that. That is plan, the thing we have not got." Mr. Blomfield's way of expressing the same thing is as follows: "What we have to do in England is to build up a sense of the 'big manner.' It does not exist, and without it you can never make a noble city." Mr. Blomfield has said somewhat the same thing before. He has the reputation of being a Classicist and, in speaking of the grand manner, he probably would limit the expression generally to Renaissance design. Mr. T. G. Jackson points out, however, that the Gothic builders in the Middle Ages realised the importance of regular and symmetrical planning in the lay-out of new towns. He says the irregular street that comes by accident, with undesigned picturesque effects, is, perhaps, the most delightful of all to an artist, but then it must be accidental and undesigned. We are at one, however, with Mr. Blomfield in thinking that, as he puts it, the big manner is required in designing buildings as well as planning cities. We have had too much of the picturesqueness that Mr. Jackson seems to consider so delightful. Picturesqueness serves well enough in a small town, but when one gets to a large city regular planning calls for symmetrical design, massing, and largeness of scale. Mr. Blomfield, in referring to Mr. Norman Shaw's design for the Quadrant in Regent Street, says he "has set us a fine line to follow, though his scale is possibly too magnificent for any of us." The views illustrating the paper on the architecture of the Roman Empire read last Friday evening before the Architectural Association (see page 203 of this issue) might be cited as strikingly emphasising the importance of this "big manner." Even Mr. Norman Shaw's work, which to Mr. Blomfield seems too great in scale, is puny beside that of the Romans. Of course, in the past, architecture was a popular art and the people took a pride in fine buildings and did not mind the expense, which, in this commercial age, is always foremost. But of late we have witnessed an increase in public-spirited endeavours to improve matters, and it is to be hoped that architects will cultivate the grand manner so as to be able to deal with great opportunities when they arise.

Adding a Shelter to Birmingham Town Hall. We notice that several letters have recently appeared in the correspondence columns of the "Birmingham Daily Mail" suggesting the erection of a permanent covered way round the Town Hall. This proposal, we are assured, crops up triennially at the time of the Musical Festival, being suggested by the unsightliness of the temporary wooden structure which is erected on such occasions, and the general recognition of the discomfort and inconvenience which is suffered by those who attend concerts at the Town Hall on any other occasion when it happens to be wet, the only shelter to be had being that afforded by the arcade at the front entrance. The Birmingham Town Hall is a severely classic building, a massive structure; and, of course, the idea of a shelter around it is disquieting—even assuming that there was no chance of the "graceful iron structure" making its appearance. However, whether a shelter will ever be erected or not, the suggestion has an interesting general application. The problem is obviously a difficult one, and we regret that architects should so frequently shirk it, with the result (as we see, for example, at hotel entrances especially) that the ironwork provider comes in after the architect has finished his part of the work, and very quickly there arrives that familiar affair of scrolls and glass which spoils the building. Architects would serve their interests best, therefore, if they took the trouble to design these shelters or awnings in the first place. In connection with the Birmingham proposal, Mr. Bidlake has observed that an iron and glass enclosure round the Town Hall would be an abomination, though if the Town Council dealt with the matter they would probably go in for a covered way of that sort. He could believe it possible to make the Town Hall architecturally correct with a colonnade round it, but the great problem was to prevent the dwarfing of the main building. The only way would be to get a model made to try the effect and have it popularly exhibited. The error was made when the Town Hall was built. "The simplest way of meeting the requirements now, I should imagine, would be to carry the arcade along the sides, but when that is done it will emphasise the weakest part of the design, and even then it is a question whether, with such tall arches, sufficient protection would be afforded from the weather."

A.A. OF IRELAND.

President's Address.

At the annual meeting of the Architectural Association of Ireland, held in Dublin last week, the newly-elected president, Mr. Joseph Holloway, delivered his inaugural address. His theme was Irish architecture and Irish materials. Mr. Holloway urged architects in Ireland to use Irish stones, bricks, slate, &c., when and where they could, for it stood to reason that the materials of a country were the best and most suited for buildings in that country. How characteristic were the homes, in the different counties of England, of the locality in which they were reared. They seemed part of the place, grown naturally out of their surroundings. But the Irish climate was a damp one, and the half-timbered houses recently erected around Dublin were not at all suitable on that account at least, however much they were "at home" in the rural districts of England or in the suburbs of English towns. Let them study the best examples in their own country, and try to improve upon them on their own lines.

In Ireland the simple-minded might imagine that there was good granite enough and to spare (what with Dalkey, Newry and Galway granites, to mention a few), yet some architects must rush to Belgium or Aberdeen for granite. The thing was a farce. The cry was that Irish granite could not be got to time; yet he had been credibly informed that a certain job in Dublin had been delayed for more than three months waiting for the foreign material to arrive.

Did it ever strike them that

all Irish architects should be Home Rulers

when they thought of what was accomplished before the Union in the way of architecture in Dublin? All (or nearly all) the fine old buildings in the city of which they were so proud were erected during the sitting of the Irish Parliament in College Green, and why not again? He strongly recommended that their young architects should sketch the fine old doorways, railings, &c., that abounded in Merrion Square, Fitzwilliam Square, Stephen's Green, and in many of the streets on the north side of the city. They were all well worthy of study.

Mr. Norman Shaw had said that he saw energy everywhere in the architectural profession in England, that architects were working nowadays in what he thought the right direction towards evolving a characteristic modern English style, in domestic work at any rate. Why did Irish architects not try to do the same, and evolve an Irish style of architecture, based on their own climate, their own materials, their own ways of life, and their own landscape, instead of persisting in weak copies of English work? A lustier style was required than the tasty-looking, fragile Swiss cottage types (as half-timbered work was invariably called by the lay critic) that architects were causing to be erected round the city.

Extensive Alterations to the Cutlers' Hall, Sheffield, have been carried out under the direction of Mr. A. E. Turnell, architect, of Sheffield. The principal object of the scheme has been to provide an improved entrance to the Lower Hall, and to give better cloakroom and lavatory accommodation. The alterations have been carried out by Messrs. Ash, Son & Biggin, of Sheffield, and the lavatories have been fitted by Messrs. Doulton & Co.

PRACTICAL NOTES FOR ARCHITECTURAL DRAUGHTSMEN.

By Alfred W. S. Cross, M.A., F.R.I.B.A., and Alan E. Munby, M.A.

THE ORDERS AND THEIR APPLICATION.

(Continued from p. 158, No. 608.)

Plate IV.

In dealing with the applications of the Orders to buildings involving the spacing of the columns and the size and arrangement of apertures it is not desirable, nor, indeed, possible, to lay down rules for dimensions in the manner which has been attempted for the Orders themselves; for the elevation of a building must always be subservient to the plan in all but purely ornamental structures, and plans of buildings admit of no generalisations.

The relations and dimensions given in this and similar subsequent plates must, therefore, be looked upon as necessarily somewhat elastic. At the same time, such dimensions as are given should not be disregarded, but considered in the light of proportions to be attained as far as the exigencies of the plan will admit.

The spacing of arcading dealt with in this plate should be governed by the height of the space to be treated, and it will be found that the best effects are obtained when the widths of the openings approximate to half of their height, and when the total width of the piers lies between one-half and two-thirds of that of the opening.

The spacing must also be considered in reference to the Order employed, so that when triglyphs, or modillions, are placed centrally over the columns their proper spacing may be interfered with as little as possible. It will thus be seen that a relation exists between the diameter of the column, the width of the pilaster, and the width of the opening. Again, the diameter of the column relatively to the opening will be influenced by the presence, or absence, of a pedestal to the Order. The following summary collected from Gibbs's work, giving the dimensions to be aimed at in order to comply with the above relations, will be found useful :—

Diameter of Column = 1.

	Tuscan.		Doric.		Ionic.		Corinthian.	
	No Pedestal	With Ped.	No Ped.	With Ped.	No Ped.	With Ped.	No Ped.	With Ped.
Width of bay centre to centre	6	7	$6\frac{1}{4}$	$7\frac{1}{2}$	6	$7\frac{1}{2}$	$6\frac{5}{12}$	$8\frac{1}{6}$
Width of one pilaster	$\frac{1}{2}$	$\frac{2}{3}$	$\frac{1}{2}$	$\frac{5}{8}$	$\frac{1}{2}$	$\frac{5}{8}$	$\frac{9}{16}$	$\frac{7}{10}$
Width of opening	4	$4\frac{2}{3}$	$4\frac{1}{4}$	$5\frac{1}{4}$	4	$5\frac{1}{4}$	$4\frac{1}{3}$	$5\frac{3}{5}$

The height of the impost should always be about two-thirds of the height from the ground to the soffit of the architrave of the Order, whether a pedestal is in use or not. The impost may be a mere block or string, or a cap as represented. The arch above is semicircular in form, and should spring from the top of the impost, unless the point of observation is considerably below it, as in storeyed buildings, when it should be slightly stilted in order that the whole of the curve may be seen.

The archivolt or moulding running round the arch should be the same width as the pilaster (less any necessary clearance for the mouldings)—that is, about one-eighth of the width of the opening, which should also be the height of the impost cap to the bottom of the necking. Further details as to the members will be found on Plate V.

Unless the arch is a very small one, a keystone should be always provided. Its width at the bottom should be equal to the width of the archivolt and its sides parts of radii of the arch, while its length should be one and a half to twice its breadth at the bottom. If no keystone is used, the archivolt should still be kept below the architrave of the Order to about the same extent. The thickness of the piers, from back to front, must naturally be governed by constructional considerations; but as regards appearance they should be one-quarter to one-third of the width of the opening. Angle piers should be wider than the rest, to give real and apparent strength; they may be even half as wide again as those of the general façade.

These rules as to the width of archivolts and pilasters may be considerably varied, in the direction of increased dimensions, when columns and other features, which otherwise would be thrown out of scale, are absent.

Plate V.

Impost Mouldings.

Details are here given of impost mouldings, with their archivolts, suitable for the different Orders. The divisions of the imposts are all simple and similar in each example, the height of the corona and of its mouldings above, if any, being equal to the height of the mouldings below, which, again, are equal to the necking. The bead and fillet below the necking are one-sixth of the height of the impost, the bead being double the height of the fillet. The projection of the impost beyond the line of the pilaster is equal to the height of the corona and member over in the first two Orders, while the projection of the corona itself is equal to this height in the last two.

The pilaster is square on plan, and, therefore, the plan of the archivolt is represented by this square upon which the mouldings are placed. An examination of these mouldings will show that they resemble the architraves given for their respective Orders, and their forms admit of similar variations. It will be noticed that the innermost face is always in the plane of the face of the pilaster, while the projection of the moulding at the extrados increases from about one-quarter the width of the whole archivolt in the Tuscan to one-third in the Corinthian Order.

(To be continued.)

A Correction.—On p. 156 of our issue for October 3rd read "base" for "shaft" in the last line of the description of the Doric Order, Plate II.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Reinforced Concrete Bridge.

DUNFERMLINE.—CLARION writes: "Can you advise as to the sufficiency of a bridge on a public road over a private roadway? It is 12ft. 6in. wide, and abutment walls will be of brick. Would reinforced concrete be suitable for heavy loads? Could you suggest the thickness at crown, and would expanded metal be preferable to rods? Could you give weights?"

Some useful notes upon designing a reinforced concrete bridge are given by D. B. Luten in "Engineering News" for June 28th last. (1.) *To determine the curve of intrados.*—Draw an ellipse of the required span and rise. Pass a segment of a circle through the crown and springings of the ellipse. Bisect the vertical ordinates between the ellipse and the circle as at A, Fig. 1. Approximate the resulting curve by arcs of circles, adjusting the curve at the springings, to become tangential to the verticals. Let C = crown thickness in inches, S = span in feet, R = rise from springings to crown in feet, F = fill over crown of extrados in feet, H = height of opening from pavement to crown in feet, U = uniform live loading in lbs. per sq. ft., L = moving load that will be concentrated on single track or single roadway, over entire span in tons of 2,000lbs., E = radius of extrados in feet, I = radius of intrados at crown in feet, P = diameter of abutment ties in inches, A = diameter of arch rods in inches, D = distance between rods in feet. (2.) *To determine the crown thickness.*—

$$C=\frac{3S^2(R+3F)}{4{,}000R-S^2}+\frac{US^2}{30{,}000R}+\frac{L(S+5R)}{150R}+4.$$

Applied to the present case

$$C=\frac{3S^2(R+3F)}{4{,}000R-S^2}+\frac{US^2}{30{,}000R}+\frac{L(S+5R)}{150R}+4$$

$$=\frac{3\times12{\cdot}5^2\times(2{\cdot}5+3\times1)}{4{,}000\times2{\cdot}5-12{\cdot}5^2}+\frac{280\times12{\cdot}5^2}{30{,}000\times2{\cdot}5}$$

$$+\frac{25(12{\cdot}5+5\times2{\cdot}5)}{150\times2{\cdot}5}+4=0{\cdot}262+0{\cdot}6$$

$+1{\cdot}666+4{\cdot}0=6{\cdot}528=$say 7 ins. (3.) *To determine the curve of extrados.*—The curve of the extrados is a segment of a circle of radius $E=I+\frac{C}{5}$. The extrados circle should be produced to its intersection with the abutment ties produced, but if such intersection does not occur within 75° of the crown of the extrados circle, then the back of the abutment is determined by a tangent to this circle, having a batter of 1 in 4. In the present case the abutments are to be of brick, which will slightly affect the ends. Radius $=E=I+\frac{C}{5}=12{\cdot}5+\frac{7}{5}=12{\cdot}5+1{\cdot}4=$ say 14ft. (4.) *To determine the diameter of abutment ties*, say 15ins. centre to centre.

$$P=\tfrac{1}{5}\sqrt{D(2C+H)}=\tfrac{1}{5}\sqrt{1{\cdot}25(2\times7+12{\cdot}5)}$$

$=\frac{5{\cdot}7}{5}=1{\cdot}14$ say $1\tfrac{1}{8}$-in. rods. (5.) *To determine the diameter of the arch rods*, 15-in. centres. $A=\sqrt{D\frac{SL}{250C}}=\sqrt{\frac{1{\cdot}25\times12{\cdot}5\times25}{250\times7}}$ $=\sqrt{0{\cdot}223}=$say $\tfrac{1}{2}$-in. rods. The complete design may now be prepared as in Fig. 2.

HENRY ADAMS.

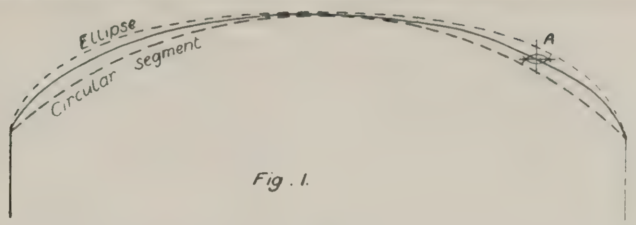

Fig. 1.

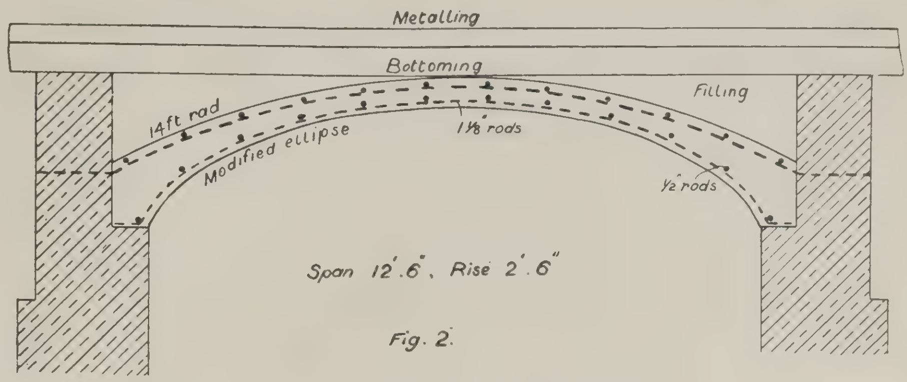

Fig. 2.

A SMALL REINFORCED CONCRETE BRIDGE.

New Windows and Ancient Lights.

A. B. writes: "(1) In taking down a building to the ground, with ancient lights in the gable end overlooking property adjoining, have I a right to re-erect the gable end and put in new windows of the same sizes in the newly-built gable? (2) Should I retain the right by propping up the windows in their old positions and taking the wall down and re-building around same? (3) Am I obliged to retain the exact positions of the old windows in the new gable, or can I re-arrange same, but keeping to the old sizes?"

(1) You lose no right by pulling down the wall and re-building, but you should re-build within a reasonable time. I advise you to have a careful drawing made by a competent man, showing the elevation of the old wall, with sizes and positions of the old lights, in case any dispute should hereafter arise with the owner of the "servient tenement." (2) There is no necessity for the awkward expedient you suggest. Put your old window frames into store, in case you need to hereafter produce them. (3) The Courts have several times decided that, though a man may alter his lights (*i.e.*, put in another kind of window) he may not enlarge the aperture. You should be careful to keep your new windows as nearly as possible the same as the old ones, and though it is probable that a slight alteration in their position will not cause you any legal difficulty, I suggest that in such a case you will do well to obtain your neighbour's approval of the altered positions. The law is "that lights in respect of which the right . . . is sought to be enforced must be substantially the same as the lights which have been gained by user or grant, and that no new light can be substituted without the consent of the owner of the servient tenement."

F. S. I.

Safe Load on Stone Column.

LONDON.—PUPIL writes: "There is a stone column in Ham Hill stone at the corner of an entrance porch to a house, with girders over, carrying walls, etc. The diameter of the column is 11½ins. at the middle, and the height from cap to base 9ft. 10ins. The total weight supported is 14 tons. Is the column safe? What is the safe load to put on Ham Hill stone per cubic foot 1ft. square? Sketch sent (not reproduced)."

The shaft of the column being swelled, and the maximum diameter 11½ins., the end diameter may be 10ins. or less. The actual minimum diameter should have been given, as this is the measure of the supporting area. Assuming it to be 10ins., the area will be 0.545 sq. ft. With Ham Hill stone cracking commences at 100 tons per sq. ft., and ultimate crushing takes place at 102 to 312 tons per sq. ft. on short specimens. A factor of safety of 10 is necessary in the practical use of stone for carrying loads, so that $\frac{100}{10}=10$ tons per sq. ft. extreme safe working load. Then $10\times0{\cdot}545=5{\cdot}45$, say 5½ tons, is all that ought to be put upon these columns; while one of them is stated to carry 14 tons, and therefore stands at a great risk.

HENRY ADAMS.

Buildings to Measure near Berwick-on-Tweed.

GLASGOW.—STUDENT writes: "Please name some buildings in or near Berwick-on-Tweed suitable to measure for the R.I.B.A. intermediate examination. Can you give any information about the town hall and the parish church of Berwick?"

There is very little good work in the neighbourhood of Berwick-on-Tweed. The parish church of Holy Trinity, built in a debased Gothic style, was completed by Puritans in the time of the Commonwealth, 1652, when the spire and tower were deemed unnecessary. It was restored and the chancel added in 1855. There may be a few features in it worth measuring. The building in the High Street which is the town hall, market place and gaol was built by Joseph Dodd, 1754-61. At Cocklan there is the ruined castelet of the Carrington family.

H. Y. M.

Chestnut Wood.

LONDON.—A. E. H. writes: "Having heard that chestnut wood used in the construction of a verandah or summer-house possesses the peculiarity of keeping off spiders, earwigs and other garden insects, I shall be glad if you can say positively that this is so."

I fear that this virtue cannot be maintained for the chestnut (no doubt the "Sweet Chestnut" is referred to), and my own experience has been that, as it cracks a good deal with the sun, it rather affords a harbour for insects. It is largely used for hop-poles in some districts, but is always displaced in favour of the more enduring larch where the latter is obtainable.

Notes on Competitions

Mexborough Secondary School.

In this competition the design of Mr. J. E. Knight, of Rotherham, has been placed first; that of Mr. W. S. Braithwaite, of Leeds, second; and that of Messrs. Smith and Ensor, Sheffield, third. The designs have been on exhibition during the past week.

Emsworth Sewerage Scheme.

The competition for this scheme, to cost £17,000, has been decided in favour of Messrs. W. B. G. Bennett, Son and Berry, civil engineers, of Southampton and London; the scheme of Mr. H. Stringfellow, Emsworth, being placed second. There were 32 competitors. The assessor was Mr. G. R. Strachan, M.I.C.E.

Ellesmere Sewerage Scheme.

Nineteen schemes have been submitted in this competition.

The New County Hall.

Writing to the "Standard" in reference to this competition, Mr. Horace T. Bonner, A.R.I.B.A., says: —"On July 26th I addressed a memorial to the members of the London County Council asking that they should reconsider the question of inviting designs for the proposed building (which is to cost over one million pounds of the London ratepayers' money) from foreigners, and asking the committee to restrict the competition to British subjects. On October 10th I received a reply from Mr. Gomme, the clerk to the council, stating that he had laid my letter before the Establishment Committee of the London County Council, and he had to regret that the committee could not see their way to adopt my suggestion or alter the conditions. Now this building is not one that will be of an international character—it will be hardly even municipal, but almost, we might say, parochial. Then why should any foreigner have a finger in a pie to which, perhaps, he has not or ever will contribute one penny? If we are compelled to be parochial, let us be at least patriotic."

List of Competitions Open.

Deposit for conditions given where known.

DATE OF DELIVERY	COMPETITION.
Nov. 30	LIBRARY AT NEWTON-IN-MAKERFIELD.—Cost £4.000. Particulars from C. Cole, clerk to U.D.C., Town Hall, Earlestown, Lancs. No deposit.
Dec. 12	LAY-OUT OF RIDDRIE ESTATE, GLASGOW.—Premiums of £75, £50 and £25. Particulars from A. W. Myles, town clerk, City Chambers, Glasgow.
Dec. 31	DUAL SECONDARY SCHOOL AT GOOLE.—Premiums £50 and £25. Particulars from James W. Johnson, clerk to Governors, Council Offices, Goole. Deposit £2 2s.
Dec. 31	NURSES' HOME AT GENERAL HOSPITAL, WOLVERHAMPTON.—Particulars from J. Stephen Neil, House Governor and Secretary, General Hospital, Wolverhampton.
1907 Feb. 1	CHILDREN'S HOSPITAL AT SUNDERLAND.—Premiums of £100, £50 and £25. Particulars from T. Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland. Deposit £1 1s.
No. date.	BATHS AT ASHTON-IN-MAKERFIELD.—Limited to architects in Wigan and Leigh Poor Law Unions. Particulars from A. Sykes, clerk, Council Offices, Ashton in-Makerfield.

Notes and News

Mr. A. E. Pridmore has been re-elected president of the Society of Architects.

The Institute of Builders held its annual dinner on Wednesday last at the Hotel Metropole, Mr. Frederick L. Dove, president, in the chair.

Mr. Batsford and the "Times" Book Club.—Mr. B. T. Batsford, the well-known architectural publisher, writes to the "Daily Mail" in reference to the "Times" Book Club. Mr. Batsford, in the course of his letter, says: "It may interest some of your readers to know that one of my recent illustrated books, which I issued at £1 11s. 6d. nett, and of which I printed 2,000 copies, cost me, with author's royalty, over 18s. a copy. Many of my books, after allowing for royalties, cost nearly half the published price, and sometimes more. . . ."

New Works in Scotland.—With reference to the article under this head, on p. 186 in our issue for October 10th, dealing with the large scheme of new works at Kinlochleven for the British Aluminium Co., Ltd., we are asked to state that the reinforced concrete conduit leading from the reservoir to the head of the pipe line will be constructed with expanded steel supplied by the New Expanded Metal Co., Ltd., of Westminster. The conduit will be 8ft. square and 3½ miles long, built entirely of reinforced concrete, and roofed with slabs of the same material.

Architects and Rifle Shooting.—The Architectural Association Rifle Club will be inaugurated on Saturday, October 27th, at 3.30 p.m., by Major-General Lord Cheylesmore, C.V.O. (president of the National Rifle Association and Mayor of Westminster), at the headquarters of the London Scottish R.V., 59, Buckingham Gate, S.W., where rifle practice will be held on Thursday evenings from 5.30 to 9; revolver practice once a month. We wish the club every success in its patriotic aims. We should like to see other architectural associations following suit. The A.A. Rifle Club is limited to members of the A.A., or the Day School, the annual subscription being 7s. 6d., with 2s. 6d. subscription to the A.A. Athletic Club. Mr. J. H. Squire, 69, Palace Court, W., is the hon. secretary.

SELBY ABBEY FIRE.

The fire which occurred last Saturday at Selby Abbey has, of course, resulted in irreparable injury; but the structure has not, as one might assume from newspaper headlines, been "ruined." The "Norman" nave and the "Early English" choir remain, though blackened and spalled in parts. The nave roof has been destroyed, and the pews in the nave. The modern organ, about which so much regret seems to be uttered, is a very small loss monetarily. The timber vaulting to the choir has also been burned, and in falling has demolished the reredos. The stained-glass window on the north side of the choir was also burned out; but, remarkable to relate, the east window has remained intact. The greatest loss is the destruction of the richly-carved choir stalls. It will not, however, be so difficult to restore the church, for it must not be forgotten that the building was restored in 1872-3 by Sir Gilbert Scott, and later again at a cost of £10,000. The damage done is estimated at £50,000.

R.I.B.A. PROGRAMME.

The following is the programme of meetings of the Royal Institute of British Architects for the forthcoming session, so far as at present arranged:

1906.	
Nov. 5.	Opening Meeting. Presidential Address. T. E. Collcutt.
Nov. 19.	The Crœsus (6th century B.C.) Temple of Artemis at Ephesus. A. E. Henderson.
Dec. 17.	Strength and Composition of Mortar. W. J. Dibdin.
1907.	
Jan. 21.	Marbles, their Ancient and Modern Application. Sir Lawrence Alma-Tadema and William Brindley.
Feb. 18.	Modern Church Building. Sir Charles Nicholson and Hubert C. Corlette.
Mar. 18.	Libraries. Henry T. Hare and J. Duff Brown.
April 8.	Hotels. Stanley Hamp.

R.I.B.A. Examinations: An Alteration.

The following changes in the days of sitting for the R.I.B.A. examinations have been sanctioned:—The Preliminary and Intermediate examinations will begin on Monday instead of Tuesday as formerly, and there will be an interval of one day between the written and the *vivâ voce* portions of the Intermediate. The Final and Special examinations will begin on Thursday instead of Friday as formerly, and there will be a similar interval between the written and the *vivâ voce* work. These changes, which have been made in order to give the examiners more time to go through the candidates' written work, will come into operation at the examinations next month.

Our Plates

A Block of Town Houses.

The mansions and flats shown in the perspective view have been erected on a site facing St. James's Palace in Cleveland Row, S.W. The block has been designed for three town houses with motor accommodation, provided at the back. The windows are grouped symmetrically and enriched by the use of iron balconettes of an architectural character, the whole building being crowned by a modillion and dentilled cornice. The materials employed are Portland stone for the walling, with Westmorland slates on the roofs. The general contractor was Mr. J. Carmichael, of Wandsworth, and the architect Mr. Frank T. Verity, F.R.I.B.A., of 7, Sackville Street, London.

Design for Whitefield Tabernacle Extension.

The design for an extension of Whitefield Tabernacle, Tottenham Court Road, was submitted in competition some time ago. The building was intended to be carried out in stocks and red bricks, with a base 6ft. or 7ft. high of salt-glazed bricks. The chequered band above is faced with green and white glazed bricks. The apparent battlements on the ground floor are merely the thinning of the front wall, done externally in place of at floor level inside, and have become much exaggerated in photographing from the coloured original. The roof, except for the three gables, consists of two large asphalt flats, to be used as airing-grounds, one for the factory girls' club (over lecture-rooms) and the other for the Institute, most of the rooms of which are shown on the basement plan. The billiard and reading rooms shown on the principal floor are part of another club—one for workmen. The architect was Mr. F. W. Troup, F.R.I.B.A., of 14, Gray's Inn Square, W.C.

THE ARCHITECTURAL ASSOCIATION.

The Architecture of the Roman Empire.

A meeting of the Architectural Association was held on Friday evening last at 18, Tufton Street, Westminster, Mr. R. S. Balfour, F.R.I.B.A., president, in the chair. The minutes of the preceding meeting having been read and confirmed, 59 new members of the Association were elected, and the report and balance sheet for the past year was approved. Mr. Alan Potter then read a paper on "The Architecture of the Roman Empire." The particular interest of this paper was in the excellent series of lantern slides illustrating it. These showed all the most notable buildings and engineering works of the Romans, and in connection with them Mr. Potter gave a running commentary, dealing with his subject chronologically. Without the illustrations we do not think it sufficiently to our purpose to give Mr. Potter's remarks in full, but the following is a summary of what he said:—

Of the Augustan era, which embraced the commencement of Imperial Rome, the chief remains are in the neighbourhood of the capitol. These are the Forum Julium, with the Temple of Mars Ultor to the north; the Basilica Julia, used as a law court, open in the centre, and surrounded by a double colonnade of piers in two storeys; the Temple of Castor, rebuilt on a podium of concrete and marble 22 ft. high; the circular Temple of Mater Matuta, with which it is interesting to compare the circular Temple of Vesta at Tivoli—the former, on low-lying ground, having a peristyle of 20 Corinthian columns of the very light proportion of 11½ diameters, while the latter, perched on the edge of a precipice, has columns of only 9½ diameters; the Temple of Minerva at Assisi; the arch erected at Rimini by Augustus in B.C. 27; the triumphal arch at Susa in Piedmont; and the palace on the Palatine.

Having briefly considered these works of Augustus, Mr. Potter went on to deal with

The Hydraulic Enterprises of Claudius.

The Acqua Claudia was built during his reign (38-52 A.D.) to bring water from the Alban Hills, 40 miles away, and was raised high enough to supply the highest hills in Rome. The Anio Novus, a channel built on the top of this aqueduct, was 50 miles long. Claudius also built, in opposition to the Council of Government engineers, a large harbour two miles west of Ostia, enclosed by two jetties each 800 yds. long, with a varying depth of 15 ft. to 18 ft., necessitating the removal of 112,000,000 cubic ft. of sand. Nero proposed connecting this harbour to Rome by a canal, but the scheme was never carried out. His ambition was to lay out Rome on modern lines, but he found himself checked on every hand by the owners of private property, and the numerous small temples and shrines absolutely inviolable in the eyes of the people.

Nero's Rebuilding of Rome.

After arranging a new plan with his architects, Severus and Celer, and having provided temporary accommodation for the people, he set fire to the city, as the easiest way of getting out of his difficulties, and succeeded so well, that he reduced 10 wards of the city to ruins out of 14, without a single life being lost.

Hasty rebuilding was forbidden, as all frontage lines had to be approved, the new streets being planned at right angles to each other, as far as the lay of the land would allow. The height of houses was restricted to double the width of the street, and each had to have a portico across the front.

Nero's Golden House.

Of this land of ruins, he appropriated, for his own palace, an area of about a square mile, where he built the Golden House, in the grounds of which there were sulphur and sea-water baths, a huge lake with harbours and docks for the imperial galleys, besides colonnades, 3,000 ft. long, zoological and botanical gardens, not to mention streams, woods, vineyards, and farms.

Otho, on the day of his election, signed an order for £250,000 to complete these buildings; but after his murder, Vespasian, the first Flavian Emperor, of low birth and more parsimonious character, at once began to give back this land to the people. He and Titus founded the Colosseum on the very spot of Nero's lake, and the latter afterwards built his baths on the foundations of the Golden House itself.

(In connection with the Colosseum Mr. Potter mentioned that the authorities seem now to have entirely abandoned the idea of an awning being carried by the masts, which rested on the external row of corbels in the topmost storey, believing them merely to have been used for banners.)

The Baths of Titus.

These were of the usual plan: a main block of buildings containing the baths proper, enclosed within an outer court, part of which was set aside for games, and part for promenades and gardens. In the centre of this block was the tepidarium, and, on the same axis, were the calidarium on the one side, and the swimming bath on the other, the other sides being occupied by open courtyards surrounded by colonnades.

The arch of Titus, erected on the Via Sacra, to commemorate the final subjection of the Jews in A.D. 82, is particularly interesting on account of the representation of the ornaments of the Temple at Jerusalem, as carried in the triumph of Titus.

It was Titus and his brother Domitian who filled in the gorge between the Palaces of Caliqula and Tiberius and the House of Augustus, and built over it the Flavian Palace, which is the finest group of all the Palatine buildings, chiefly composed of banqueting halls and reception rooms, with the Imperial Basilica at the north-east corner.

Domitian also rebuilt the Augustan Palace and added the stadium on the west side of it; the walls of the latter still remain, and some small fragments of the encasing marble.

The Forum of Trajan.

On the further side of the Augustan Forum was built the Forum of Trajan, from the designs of the architect Apollodorus, together with the Ulpian Basilica and Trajan's Column and Temple. The forum proper was nearly square in plan with a colonnade running round three sides, flanked by two large hemicycles of shops and offices, and approached from the east by a gateway having one central archway with three Corinthian columns on each side.

The Harbour of Ancona.

In order to facilitate the embarkation of troops to the East, Trajan built the harbour of Ancona on the east coast of Italy, to commemorate or adorn which the Ancona Arch was built. He also continued the work of Claudius at Ostia, building inside the Claudian Harbour a huge hexagonal dock, 18 ft. deep, some 390,000 sq. yds. in extent, with nearly 6,500 ft. of quay. It was to this harbour that the fleet of despatch boats plied, and here was situated the central post office for provincial letters. The harbour at Civita Vecchia was also built at this time, and still remains among the best and safest harbours of the Mediterranean.

Trajan's reign was also responsible for the bridge across the Tagus at Alcantara, in Spain, consisting of six arches 650 ft. long in all, the two central arches having a span of 110 ft. and a height of 210 ft., the material being granite laid without mortar: and of the same date, probably, are the Segovia Aqueduct with its 320 arches, and the Tarragona Aqueduct 1,000 ft. long with 39 arches. The arch at St. Remi, in France, also seems to be of this date, while in Africa the triple arch at Timgad, dedicated to Trajan the son of Nerva, is especially interesting.

At Beneventum, in Italy, the Senate in 114 built an arch in expectation of the Emperor's triumphal return from the East, where he was adding many new provinces to the Empire; but in 116 he died out there without returning home.

The Buildings of Hadrian.

The first act of Hadrian his successor was the restitution of these provinces; and his whole reign seems to have been a perpetual journey, as he visited, in person, every province of the Empire, from Scotland to Egypt. He was keenly interested in the arts, and is responsible for the design of the Temple of Venus and Rome built between the Forum and the Colosseum.

The great vaulted rotunda known as the Pantheon was also built by Hadrian, though previously considered to belong to Republican times. The interior is lighted by a single circular opening at the apex of the dome, which gives a window area of not quite 4 per cent. of the floor space. The portico on the south side was constructed of materials taken from the Temple of Agrippa previously standing to the north of the rotunda.

At Nimes, in the south of France, there is a perfect temple of this date.

At Athens the Odeion was erected by Herodes Atticus, who also erected a theatre at Corinth, a stadium at Delphi baths at Thermopylæ, and an aqueduct at Canusium in Italy.

The best-known building of the reign of Antoninus Pius, who suceeded Hadrian, is the Temple of Faustina.

The Colonnaded Streets of Syria.

The Syrian towns at this time were tremendously wealthy, and vied with each other in the display of architecture. At Palmyra, 140 miles north-east of Damascus, there are the most numerous remains, but all the large towns, such as Antioch, Gerasa and Damascus, were laid out in a similar manner.

The most remarkable features perhaps were the colonnaded streets carefully set out with architectural intent. One at Palmyra, ovr 3,000ft. long, consists of a central roadway 37 ft. wide open to the sky and flanked by Corinthian columns 31 ft. high, with sidewalks 16 ft. wide, which were covered with terrace roofs extending over the adjoining shops and offices.

The Temple of the Sun at Palmyra was enclosed in a huge courtyard more than 700 ft. square, surrounded by a double Corinthian colonnade. At Damascus the courtyard was over 1,000 ft. square, while at Baalbec the Temple of the Sun had a colonnaded forecourt about 500 ft. square.

In Africa, of this date, there is the triple temple at Steilla, also standing within a colonnaded enclosure 200ft. square, entered from the south-east by a triple arched gateway.

Belonging to the next reign is the Temple of the Capital at Dougga in Africa, as also the Arch at Orange.

The Works of Septimus Severus.

Septimius Severus, leader of one of the three provincial armies, having seized Rome after internal tumult, restored Domitian's Stadium on the Palatine, and built further west a new palace, the facade of which faced the Appian Way and consisted of seven colonnaded storeys 210 ft. high. The arch erected at the west end of the forum to commemorate his Parthian victories is well known. Septimius Severus died in 211 at York after an unsuccessful campaign against the Scotch, and it was there the quarrelsome brothers Geta and Caracalla assumed the purple; a quarrel which was settled within the twelvemonth by the murder of Geta.

The Baths of Caracalla

testify to the luxury of this emperor, being the most extensive in the Empire; the central block alone had an area of 270,000 sq. ft., and in plan was similar to the baths of Titus, except that the swimming bath was greatly reduced. The enclosure of the grounds was over 1,000 ft. square, in the two hemicycles of which were lecture theatres and libraries.

In Africa, at Djemila, there is an arch dedicated to Caracalla, his mother Domna, and the divine Severus, his father, and at Sebessa there is a four-sided arch with the same dedication.

At Zana there is an arch dedicated to Macrimus, successor to Caracalla, who reigned little more than a year. During the next fifty years, there were no fewer than fourteen Emperors. It was during this half century that the amphitheatre at Verona was probably built.

In 270 Aurelian came to the throne. He erected on the Quirinal at Rome a large Corinthian temple, dedicated to the Sun, which had a portico of 12 columns and was enclosed in a courtyard similar to the Syrian examples. The little circular temple at Baalbec is suppsed to be of this date, and possibly also the Temple of Jupiter.

His successor Probus is credited with building temples, bridges, porticoes, and palaces in Egypt, as he attempted to keep the army in order by thus occupying them in times of peace.

Diocletian.

After the short reign of Carus, and Carinus and Numerian, Diocletian was proclaimed emperor in 284. He, with his associates, Maximian, Galerius and Constantius, re-established order and tranquillity throughout the Empire.

Of the baths he built in Rome there are considerable remains, the tepidarium or central hall being preserved as the nave of Santa Maria degli Angeli.

The emperor himself spent only two months of his reign actually in Rome, occupying most of his spare time building the city of Nicomedia, in Bithynia, on the verge of Europe and Asia, and to such an extent did he enrich it that it was only surpassed by the magnificence of Antioch, Alexandria and Rome.

In 306 he abdicated and retired to the coast of Dalmatia, near the city of Salona, where he had built himself a palace, the finest feature of which was the colonnade on the south side, facing the sea.

Emperor Constantine.

After the retirement of Diocletian the Empire fell again into great disorder, at one time there being no fewer than six emperors; but eventually, after the defeat of Maxentius, Constantine became sole ruler.

The Basilica built to the west of the Forum at Rome by these two emperors was practically a copy of the tepidarium of Caracalla's baths.

The Arch of Constantine is too well known to need remark, except perhaps to say that most of the sculpture belongs to an earlier date, ruthlessly taken from the buildings of Hadrian and Marcus Aurelius.

The Building of Constantinople.

For Constantine, born on the banks of the Danube, and raised to the throne by the army of Britain, Rome had little attraction, and it was his great ambition to perpetuate his memory by building a new capitol further east. When he came to the actual building of Constantinople he soon found that the skill and number of his architects were not equal to the carrying out of his ideas; so much so that he founded schools of architecture in all the provinces of the Empire, and by offering prizes and rewards encouraged capable men to make themselves known.

The immediate result at Byzantium was a number of elaborate buildings, hurriedly erected on narrow streets, to adorn which he ordered that the ancient buildings of the Empire should be robbed of their carvings and statues.

Within a hundred years of the foundation of Constantinople there were erected in the city a huge elliptical forum, a hippodrome more than 300 yds. long, a circus, 2 theatres, 8 public and 150 private baths, 52 porticoes, 5 granaries and 8 aqueducts, besides 14 churches, 14 palaces and 4,388 houses.

Mr. Hugh Stannus, in proposing a vote of thanks to the lecturer, said that such a succinct account of Roman architecture had not, he thought, been given before, and they were all indebted to Mr. Potter for a most instructive and interesting paper. Mr. Arthur Keen seconded the vote of thanks, and after a few remarks from Mr. Balfour the meeting terminated.

It was announced that the next meeting of the Association would be held on November 2nd, when Mr. Stannus would read a paper on "The Corinthian Order."

Obituary

The late Mr. Joseph Gornall, of the firm of J. Gornall and Son, builders and contractors, Bolton, who died on September 23rd, left estate which has been proved at £21,246 gross.

Mr. Henry McKay, architect, of Hove, aged 43, was found drowned in the canal at Aldrington last week. At the inquest a verdict of "found drowned" was returned.

Mr. H. W. Stock, F.R.I.B.A., B.A., district surveyor for St. Anne, Limehouse; St. John, Wapping; the Precinct of St. Katharine, and the Hamlet of Ratcliffe, was found drowned in the Thames near Pangbourne on Thursday evening last, after having threatened suicide.

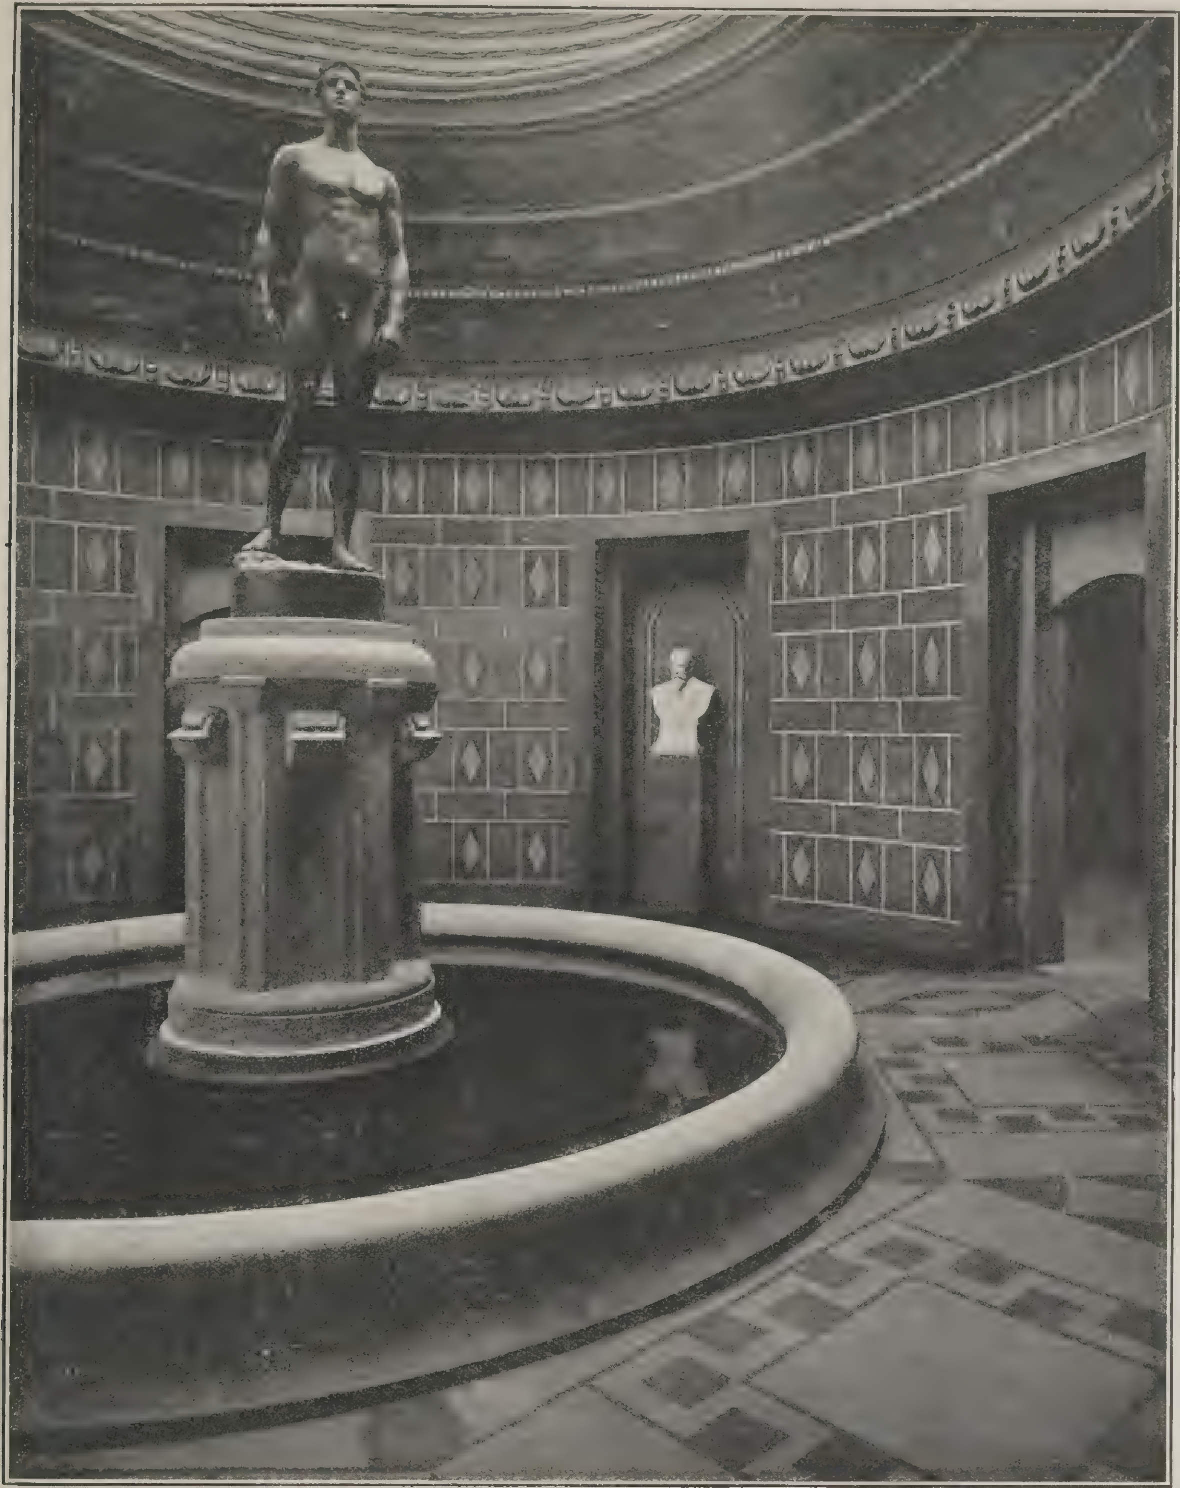
FRENCH SCULPTURE.

A lecture on this subject was given last week by Mr. Henry F. David before the first meeting of the session of the Aberdeen Architectural Association. The lecture dealt with the outstanding developments of sculpture from the time of its severance from Gothic influence in the 15th century down to the work of Rodin. In Jean Goujon, "the first modern French sculptor," the characteristics of culture, refinement and tradition were seen in a high degree. The periods of Louis XIV. and XV. showed the art entangled with the whims and caprice of a vain and pleasure-loving time; and in this it remained true to its character as an expression of paramount tastes and tendencies.

The pronounced feeling for classical tradition and culture in French art generally found an outlet in the works of Pradier and Etex and others of the Greek school in the early 19th century. Its unfailing return to nature, as the corrective of a lapse into convention and formula, appeared in the works of Houdon, the great portraitist of the early 19th century. His seated statue of Voltaire was an instance of this. This was followed by the highly individual work of Rude, Carpeaux and Barye, carrying the work into contemporary times.

Rude's famous group on the Arc de Triomphe in Paris was referred to as an example of a fine plastic motive, expressed with a keen individual feeling and classic restraint and dignity. "The Dance," by Carpeaux, on the façade of the Opera House exhibited the high-water mark of the expression of life and movement to an extent almost antagonistic to architectural dignity and restraint. The underlying motive of Barye's art was noted, and his famous bronze lion at the Louvre was selected as representative of his work in fixing the moods and actions of the splendid creatures of the animal world.

The work of the French Academy of the present day was criticised, its high level of technical accomplishment commented on, and the general elegance and culture of its sculpture; its radical fault was a too close adherence to tradition. Examples of Guillaume, Dubois, S. Marceaux and others were criticised from this point of view. The reaction against the Academy, which in recent years has sprung up in the works of Rodin and his followers, was discussed as the latest phase in French sculpture. The highly individual character of Rodin's art was dealt with by reference to some of his most important works, such as "The Burghers of Calais," "The Age of Brass," "John the Baptist," and the recent statue of Balzac, which aroused so much curiosity and resentment in the public mind.



MONUMENTAL FOUNTAIN IN ROTUNDA, DRESDEN ART EXHIBITION, 1906. WILHELM KREIS, ARCHITECT. AUGUST HUDLER, SCULPTOR.

A NEW MATERIAL.

The above illustration shows the rotunda in the pavilion called the "Saxon House" at the recent Dresden Art Exhibition. An interesting feature of the construction is that both the walls and the floor of this rotunda are carried out in a new jointless material known as "Doloment," somewhat similar to the many well-known floor materials composed of magnesian or other special cements with an aggregate of sawdust, asbestos, &c. The above example shows that the material has considerable decorative possibilities. "Doloment," we are assured, has the largest sale on the Continent among materials of its kind, although it was only invented two years ago. It received the highest awards at this particular art exhibition at Dresden last July, and also at the Hygienic Exhibition at Vienna this month. The architect to the Municipality of Berlin states that of all the different floor materials he has tried "Doloment" takes first place, and other leading architects and engineers have expressed similar high opinions. Factories for the manufacture of the material have been established at Paris, Vienna, Budapest, Amsterdam, Berlin, Charlottenburg, Düsseldorf, Frankfurt-on-the-Main, Strassburg, Basle, Wondelgem and Devant-les-Ponts, and it is just about to be placed on the English market. "Doloment" is a plastic substance having the consistency of mortar, made of pulverised wood fibre, asbestos and a mineral substance, and coloured by the mixture of various oxides to any desirable tint. It is laid in a smooth layer ½in. thick on a concrete foundation, with an intervening layer of a composition composed of cork chips, asbestos, sawdust and some cohesive matrix. This intermediate layer, being elastic, separates the surface layer from the rigid concrete foundation and makes it warmer and less resonant, absorbs moisture, and neutralises the effect of any cracks that may occur in the concrete. "Doloment" therefore, neither cracks nor bulges. It is impervious to liquids, and of course does not harbour dust, microbes, &c., having a surface like that of polished marble. The office of the British "Doloment" Works is at Royal London House, Finsbury Square, E.C.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING,

Oct. 26. Merthyr Tydfil.—*Extensive alterations and additions* to the Vulcan Hotel, Merthyr Tydfil. Plans and specifications may be seen of A. L. Thomas, A.M.I.M.E., engineer and architect, Church Street Chambers, Pontypridd. Sealed and endorsed tenders to be sent to him on or before Oct. 26.

Oct. 26. Colchester.—*Additions to the administration block* at the Infectious Diseases Hospital, Mile End. Plans may be seen and copies of specifications, quantities, &c., obtained on application to H. Goodyear. A.M.I.C.E., borough engineer and surveyor, Borough Engineer's Office, Town Hall. Sealed tenders, endorsed "Additions, Infectious Diseases Hospital," to be delivered to him not later than 10 a.m., Oct. 26.

Oct. 27. Gladhouse.—*Erection of cottage* at Gladhouse for the Edinburgh and District Water Trust. Schedules of quantities may be had on applica-to E. C. Carse, architect, 37, Frederick Street, Edinburgh, at whose office plans of the proposed cottage may be seen. Tenders, endorsed "Cottage at Gladhouse," must be lodged with W. Boyd, W.S., clerk to the Trust, Edinburgh and District Water Trust Offices, 12, St. Giles Street, not later than Oct. 27 at 10 a.m.

Oct. 27. Great Burstead.—*Structural alterations and additions* to the Council School, Great Burstead. Plans, specifications, and form of contract may be inspected at the office of F. Whitmore, architect, 73, Duke Street, Chelmsford, between the hours of 10 and 5 o'clock on any working day except Saturday. Builders desirous of tendering must send in their names and addresses to the architect at once, when a copy of bill of quantities will be supplied to each applicant, if references are satisfactory. Any tender accepted must be subject to the approval of the Local Government Board. Sealed tenders, endorsed "Tender for Great Burstead School Alterations," should be sent to F. W. Bittles, clerk, Brentwood, not later than Oct. 27.

Oct. 29. Outlane.—*Erection of a boundary wall* at the Children's Homes, Outlane. Plan and specifications may be seen on application, and sealed tenders must be sent in to reach E. A. Rigby, clerk to the Guardians, Union Offices, Ramsden Street, Huddersfield not later than noon on Oct. 29.

Oct. 29. Farnworth.—*Erection of a new public elementary school* in Plodder Lane, Farnworth. Bills of quantities may be obtained on written application to H. Rostron, secretary of education, Education Office, Darley Street, Farnworth, near Bolton, by payment of a deposit of £1 1s. Fair wages clause. Tenders must be delivered before 12 o'clock noon on Oct. 29, sealed and endorsed, to the Secretary.

Oct. 29. Leeds.—*Erection of proposed alterations and additions to works* and offices for Frank Horsell & Co., Ltd., Holbeck, Leeds. Contractors desirous of tendering are requested to forward their names to J. B. Fraser, architect, Leeds. Drawings and specification can be seen and bills of quantities obtained on payment of a deposit of £1. Endorsed tenders to be delivered to the architect before 10 a.m. on Oct. 29.

Oct. 29. Nottingham.—*Alterations and additions* at the All Saints' Schools, Forest Road West, for the Nottingham Education Committee. Plans may be seen at, and copies of the specifications obtained from, the office of F. B. Lewis, city architect, Guildhall, on payment of a deposit of £1 1s. Sealed tenders, addressed to W. J. Abel, clerk; offices, Victoria Street, properly endorsed, to be delivered not later than 10 a.m. on Oct. 29. Fair wages clause.

Oct. 29. Manchester. — *Taking down and removal of certain buildings* at the Rochdale Road Gas Works. Specification and form of tender may be obtained on application to C. Nickson, superintendent, Gas Department, Town Hall, Manchester. Any further particulars may be had on application to J. G. Newbigging, M.Inst.C.E., at his office, Rochdale Road Gas Works. Sealed tenders, addressed to the Chairman of the Gas Committee," and endorsed "Pulling down old buildings, &c, Rochdale Road Station," must be delivered at the Gas Offices, Town Mall, Manchester, not later than 10 a.m. on Oct. 29.

Oct. 30. Llanrug.—*Erection of a new chapel* adjoining Pontrhythallt Station for the Llanrug C.M. Chapel Committee. Plans and specification to be seen at the secretary's house, Eryri Terrace, Llanrug, to whom sealed and endorsed tenders are to be sent on or before Oct. 30.

Oct. 30. Exeter.—*Erection of new offices* at Exeter (St. David's) station for the Directors of the Great Western Railway. Plans and specification may be seen, and forms of tender and bills of quantities obtained, at the office of the Engineer at Plymouth (North Road) station, between the hours of 10 a.m. and 4 p.m. Tenders, addressed to G. K. Mills, secretary, Paddington Station, London, and marked outside "Tender for Offices at Exeter," will be received on or before Oct. 30.

Oct. 30. Rhondda.—*Alterations and additions to the Isolation Hospital*, Ystrad, Rhondda, including the erection of a pavilion, combined convalescent and discharging block, and additions to the present administrative block, laundry, and stable blocks for the U.D.C. Plans and specification may be seen and bills of quantities and tender forms obtained at the office of W. D. Morgan, architect, Post Office Chambers, Pentre, upon the production of a receipt for a deposit of £2 2s. from the accountant of the Council, which can be obtained at the Council Offices, Pentre. Fair wages clause. Sealed tenders, endorsed "Tender for Hospital Extensions." must be delivered before noon on Oct. 30, at the Council Offices, Pentre, Rhondda, addressed to "The Chairman of the Health Committee, Rhondda U.D.C."

Oct. 30. St. Blazey.—*Erection and completion of shops, stores, and other offices* at Station Road, St. Blazey, for the St. Blazey and District Co-operative Society Ltd. Plans, specifications, and general conditions can be seen, and full particulars obtained at the office of F. C. Jury, architect, No. 1, Alma Villas, Tregonissey Road, St. Austell. Tenders, sealed and endorsed "Shops and Stores Tender," must be sent to W. Foster, secretary, St. Blazey and District Co-operative Society, St. Blazey, Par Station, on or before Oct. 30.

Oct. 30. Timoleague, Co. Cork.—*Erection and completion of a new Parish Church* at Timoleague, County Cork, according to the plans and specifications prepared by M. A. Hennessy, architect, 74, South Mall, Cork. Copies of the plans and specifications and general conditions of contract may be seen daily at the Parochial House, Timoleague, or at the offices of the architect, South Mall, Cork. Copies of the quantities can be had on application to the architect on payment of £3 3s. Sealed tenders to be addressed to Rev. Peter Hill, P.P., Timoleague, on or before Oct. 30.

Oct. 31. Rye.—*Erection of new Grammar School*, Rye. Persons desirous of tendering are requested to send their names and addresses to E. J. Cory, High Street, Rye, Sussex, from whom full particulars can be obtained. Tenders must be delivered not later than Oct. 31, to W. Dawes, clerk to Governors, Bank Chambers, Rye.

Oct. 31. Aldershot.—*Erection of the first portion of Catholic Soldiers' Institute*, South Camp, Aldershot. Plans and specification may be seen and bills of quantities obtained from W. Bevan, F.R.I.B.A., architect, 90, Parliament Chambers, Great Smith Street, Westminster, London, S.W., on payment of £1. Tenders to be delivered by noon Oct. 31.

Oct. 31. London, W.—*Alterations and additions at No. 96, King Street*, Hammersmith. Plans of the intended works may be seen and a copy of the specification, with form of tender, can be obtained on application to H. Mair, M.I.C.E., borough surveyor. Sealed tenders, endorsed "Tenders re No. 96, King Street," to be delivered to H. Thompson, town clerk, Town Hall, Broadway, Hammersmith, W., not later than 6 p m. on Oct. 31.

Oct. 31. Plumstead. — *Erection of a new women's dining hall* at the Union House, High Street, Plumstead, for the Guardians of the Woolwich Union. The plans and specifications can be inspected at the office of J. O. Cook, Board's Architect, 1A, Eleanor Road, Woolwich, where copies of the quantities can be obtained on the payment of £1 1s. deposit, and tenders must be sent to T. Cutter, clerk to the Guardians, not later than 4 p.m. on Oct. 31, at 30, Rectory Place, Woolwich.

Oct. 31. Armley.—*Erection of new block* at the Workhouse, No. 3 Green Hill Road, Armley, for the Board of Guardians. Drawings and specifications may be inspected, and form of tender and bills of quantities obtained, at the offices of C. F. Wilkinson, architect, 35, Park Square, Leeds, on deposit of £1 1s. Tenders must be endorsed "Erection of new block at the Workhouse," and addressed to A. Gaunt, clerk, Union Offices, 1, Green Hill Road, Armley, and must be delivered before 12 o'clock noon on Oct. 31.

Oct. 31. Birkenhead.—*Erection and completion of 18 tenement dwellings* on the east side of Egerton Street. Plan, specification, and particulars can be seen and bill of quantities and form of tender obtained on application at the office of C. Brownridge, M.I.C.E., borough engineer and surveyor, upon a deposit of the sum of £3 3s. Fair wages clause. Tenders upon the printed form supplied, sealed and endorsed "Tender for Dwellings, Egerton Street," to be sent to A. Gill, town clerk, Town Hall, Birkenhead, not later than 12 o'clock noon on Oct. 31.

Nov. 1. High Spen.—*Erection of 39 cottages at High Spen*, for the Consett Iron Co., Ltd. Plans and specifications may be seen and quantities obtained upon application to C. E. Oliver, company's architect, at the General Offices of the Company at Consett. Tenders addressed to the Consett Iron Co., Ltd., and endorsed "Tender for Cottages" must be delivered on Nov. 1.

Nov. 1. Blawith.—*Alterations and additions to the residence* known as Brown Howe, also to lodge and farm buildings, situate at Blawith, near Greenodd, for Sir Robert A. Hampson. Plans and specifications may be seen on application to the gardener at Brown Howe. Sealed and endorsed tenders to be sent to W. L. Mason, F.R.I.B.A., architect, Ambleside, not later than noon on Nov. 1.

Nov. 2. Wharfedale.—*Erection of new board-room offices*, &c., for the Wharfedale Union. Quantities can be obtained and the plans seen at the offices of Fairbank & Wall, architects, 3, Manor Square, Otley. Sealed and endorsed tenders are to be delivered before 10 a.m. on Nov. 2, to E. C. Newstead, clerk to the Guardians, Union Offices, Boroughgate, Otley.

Nov. 2. Wallsend.—*Erection of Municipal Buildings*. Plans and specifications and conditions can be seen at the offices of, and copies of quantities obtained from, Liddle & Browne, architects, Prudential Buildings, Mosley Street, Newcastle-upon-Tyne. Builders desirous of tendering will be required to deposit with the architects the sum of £3 3s. Sealed tenders, endorsed "Tenders for Municipal Buildings," are to be delivered to W. V. Mulcaster, town clerk of Wallsend, 28, Sandhill, Newcastle-on-Tyne, not later than noon on Nov. 2.

Nov. 3. Footscray, Kent.—*Erection of a new Council school* to accommodate upwards of 300 children in the Longlands District at Footscray, Kent. Plans and specifications may be inspected at the office of C. St. Pierre Harris, A.R.I.B.A., architect, 8, Ironmonger Lane, Cheapside, London, E.C. Any person desiring to tender and to receive a copy of the bills of quantities must send in his name to the architect accompanied by a deposit of £1. Tenders, on the form supplied, are to be delivered to G. F. J. Goodes, Leeds, Hamilton Road, Sidcup, not later than noon on Nov. 3.

Nov. 3. Nordelph.—*Conversion of house into two cottages*; drainage and sub-division of yard and buildings; fencing of grass land at the Chapel Farm, Nordelph. Plans and specifications and conditions of contract may be seen at E. C. Warner's, at Nordelph, who will arrange for inspection of the premises. Tenders, in sealed envelopes, must be delivered to G. C. Davies, deputy clerk of the Norfolk County Council, 11, Prince of Wales Road, Norwich, on or before Nov. 3, and endorsed "Nordelph Tender." Each tender must state within what time the contractor will undertake to complete the work, as time is of importance.

Nov. 5. London, S.W.—1. *Erection of two shelters* in the playgrounds of the Special School, and alterations of playgrounds at the Queen's Road School. 2. Painting of railings round the Dundonald Road School. 3. Painting of external wood and ironwork of the old portion of the Queen's Road School, for the Borough Council of Wimbledon. A plan may be seen at, and specifications and form of tender obtained from, the Education Office, 12, Queen's Road, Wimbledon. Tenders must be delivered to A. Steele Sheldon, clerk, 12, Queen's Road, Wimbledon, by or before 12 noon on Nov. 5.

Nov. 5. Odiham.—*Alterations* at the Odiham Police Station. Persons desirous of tendering may see plan, specification, and conditions of contract, and obtain bills of quantities and all necessary information at the office of W. J. Taylor, county surveyor, the Castle, Winchester, on and after the 22nd Oct., between the hours of 9 a.m. and 5 p.m. (Saturdays 9 a.m. and 1 p.m.). A deposit of £2 2s. will be required for a copy of the bills of quantities. Deposits must be made by cheque payable to Hants County Council, and crossed "Bank of England," or particulars will not be sent. Tenders, endorsed "Proposed Alterations, Odiham Police Station," are to be delivered to H. Barber, clerk of the County Council, the Castle, Winchester, on or before Nov. 5.

Nov. 5. Dublin.—*Erection of a stationmaster's house* at Sixmilecross Station, for the Directors of the Great Northern Railway Co. (Ireland). Parties wishing to tender for the work can see the drawing and specification at the office of W. H. Mills, engineer-in-chief, Amiens Street, Terminus, Dublin, or copies of them at the office of the District Engineer, Belfast, and forms of tender can be obtained at either of the above-mentioned places on payment of 1s. each. Tenders, made out on the forms supplied by the Company, and endorsed, "Tender for Stationmaster's House," should be delivered to T. Morrison, secretary, Secretary's Office. Amiens Street Terminus, not later than 10 a.m. on Nov. 5.

Nov. 6. Mile End, Essex.—*Foundations of the main building* of the new second asylum, near Colchester, to be erected at Mile End, about 1½ miles north of Colchester main-line railway station. Persons desirous of tendering for the work may see the plans, specification, agreement, &c., at the County Asylum Office, 4, Duke Street, Chelmsford, between the hours of 10 and 4 o'clock (except Saturdays), when they will be on view between 10 and mid-day. Contractors must send in their names and addresses at once to W. P. Gepp, clerk to the Visiting Committee, Chelmsford, with a deposit of a cheque or Bank of England note of £20, when a copy of the quantities will be sent. Security to the amount of £2,000 for the due execution of the work must be given as the committee may require by and at the expense of the contractor. Sealed tenders, endorsed "Tender for Foundations, New Second Asylum, Colchester," to be delivered to W. P. Gepp, at his office, not later than Nov. 6.

Nov. 9. Willington.—*Erection of stone walls* to enclose new cemetery ground at Willington, for the U.D.C. Plans and specifications may be seen and all particulars obtained, on making an appointment with the surveyor. Tenders to be delivered to J. G. Wilson, clerk to the Council, 5, North Bailey, Durham, on or before Nov. 9, marked "Cemetery Extension."

Nov. 12. Ashington, New Hirst.—*Erection of new Council school*, to accommodate 680 scholars together with caretaker's dwellinghouse and cookery centre, at Ashington, New Hirst. Contractors desirous of tendering for the work should forward particulars of their name and address to C. Williams, secretary to the Education Committee, Pearl Buildings, Newcastle-on-Tyne, not later than Oct. 27, together with a deposit of £2 2s. Plans of the work may be inspected at the Committee's Offices, and tenders endorsed "Tender for New Hirst Council School," must be forwarded to the Secretary not later than 4 p.m. on Nov. 12.

Nov. 12. Ilford.—*Roofing-in with reinforced concrete* of the septic tanks, &c., at the Outfall Works, Loxford Lane, Ilford, for the R.U.D.C. Plans and specifications may be seen, and form of tender obtained on payment of a deposit of £2 2s., on application to H. Shaw, A.M.I.C.E., engineer and surveyor to the Council, Town Hall, Ilford, during the usual office hours. Sealed tenders, endorsed "Tender for Concreting," must be sent to J. W. Benton, clerk to the Council, Town Hall, Ilford, on or before noon. Nov. 12.

Nov. 12. Epsom.—*Erection of two acute blocks* and the re-building of a nurses' block, at the Manor Asylum, Epsom, Surrey, for the L.C.C. Instructions for tender, and form of tender and contract, with specification, can be obtained from the Clerk of the Asylums Committee, 6, Waterloo Place, London, S.W., upon payment of £5, and the plans may be inspected at the office of the Asylums Engineer, at 6, Waterloo Place, between the hours of 10 a.m. and 4 (except Saturday), and on that day between the hours of 10 and 1 p.m. Tenderers can also obtain from the engineer permission to view the site. Tenders must be on the printed form, accompanied by the form of contract and schedules thereto and forms of bond, and must be enclosed in an envelope, sealed and endorsed "Tender for New Buildings, Manor Asylum," and delivered at the office of the committee not later than noon on Nov. 12. The contractor will have to enter into bonds in the sum of £700 with approved sureties, as security for the performance of the contract. Fair wages clause.

Nov. 14. Glasgow.—*Erection of New Mitchell Library Buildings* in North Street. The Corporation are prepared to receive tenders for (1) the digging, mason, and brick works; (2) the cast-iron and steel work; (3) the fire-proof floors; (4) the wright work; (5) the metal sashes; (6) the roof glazier work; (7) the wood block floors; (8) the slater work; (9) the plumber work and (10) the plaster work. Plans of the proposed buildings may be seen at the office of W. B. Whitie, I.A., 219, St. Vincent Street, Glasgow. Copies of the specifications and forms of tender may be had on application being made in writing to A. W. Myles, town clerk, City Chambers, Glasgow, and on payment of £5 5s. Sealed tenders, marked on the outside "New Mitchell Library—Tender for.................." must be lodged with him on or before 10 a.m. on Nov. 14.

Nov. 14. North Shields.—*Erection of new secondary school* and pupil teachers' centre at Hawkey's Lane, North Shields. Bills of quantities may be obtained on application to J. C. Maxwell, architect, 25, Eldon Square, Newcastle-on-Tyne, where plans and specification may be inspected and further particulars obtained. A deposit of £1 1s. must be made for the quantities. Tenders, sealed and endorsed "Tynemouth Secondary School," must be delivered to the architect at the above-mentioned address not later than Nov. 14.

Nov. 15. Hamworthy.—*Erection of additional buildings* and alterations to the schools at Hamworthy, for the Poole Education Committee. Plans and specifications can be seen at the office of H. F. J. Barnes, architect and surveyor, Towngate Street, Poole. Tenders to be delivered on or before Nov. 15, addressed to C. Lisby, secretary to the Education Committee, Fish Street, Poole, and endorsed "Tender Schools, Hamworthy."

Nov. 15. Belfast.—*Construction of an underground convenience* in Donegall Square, North, for the Police Committee. Drawings, specification, and form of tender may be obtained in the City Surveyor's office on payment of £1 1s. Tenders, endorsed "Underground Convenience," to be lodged with S. Black, town clerk, before 10 o'clock on Nov. 15.

Nov. 20. Cleveleys.—*Erection of new public elementary sclool* at Cleveleys (near Fleetwood) to accommodate 300 scholars, for the Lanchashire Education Committee. The plans may be seen and bills of quantities obtained at the offices of H. Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on Nov. 20, sealed and endorsed, to H. Stonestreet, Education Offices, Blakiston Street West, Fleetwood.

No date. Peterculter.—*Additions to public school, Peterculter*, and carpenter, mason, slater, plaster, plumber, and painter works of caretaker's house, Plans, &c., may be seen, and schedule of quantities obtained, on early application to Wilsons and Walker, architects, 181a, Union Street, Aberdeen.

ENGINEERING.

Oct. 26. Bournemouth.—*Construction of sea-wall, Undercliffe Drive*, and other works in connection therewith, for the Town Council. Full particulars and form of tender can be obtained and plans may be seen at the office of the Borough Engineer, provided that a £10 Bank of England note has been previously deposited with him in respect of such tender. Tenders to be sent in, in envelopes provided for the purpose, to G. W. Bailey, town clerk, Municipal Offices, Bournemouth, on or before 10 a.m. of Oct. 26.

Oct. 27. Heckington.—*Sinking and boring an artesian well* to a total depth of 300ft. or thereabouts, at Heckington for the Sleaford R.D.C. Specifications, schedules, and all other information may be obtained at the office of the Engineer and Surveyor to the Council, W. B. Marsden, 74, Southgate, Sleaford, who by appointment will visit the site with contractors. Tenders, endorsed "Tender for Heckington Water Supply," to be addressed to E. Clements clerk to the Council, 74, Southgate, Sleaford, and sent in on or about 6 o'clock p.m. on Oct. 27.

Oct. 29. Beckenham.—*Supply and erection of an induced draught apparatus* in connection with the Electric Light and Destructor Works, for the U.D.C. Plans, particulars and forms of tender, obtained on application to J. A. Angell, surveyor to the District Council, or J. E. Tapper, electrical engineer, on the production of a receipt from the collector (who attends his office daily from 9 to 10 a.m. only, except on Tuesdays, when his hours are from 9 a.m. to 1 p.m.) for a deposit of £1. Tenders duly sealed and endorsed "Tenders for Induced Draught Apparatus," to reach F. Stevens, clerk of the Council, not later than 4 p.m., Oct. 29.

Oct. 29. Linares.—*Lighting by gas or electricity* the town of Linares. Tenders combining these two systems will also be admitted. The number of lights required will be as follows:—700 lights of 30 candle power, 200 lights of 10 candle power, and 4 lights of 500 candle power. The upset price the municipality will pay is 42,000 pesetas annually. Tenders will be received up to Oct. 29, at the Secretaria del Exemo, Ayuntamiento de Linares, as well as at the Direccion de Administracion, Madrid. Further particulars with regard to the conditions attaching to the contract are contained in the *Gaceta* of Sept. 22, which may be seen at the Commercial Intelligence branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Oct. 29. Erith.—*Supply and erection of* the following plant for the U.D.C.:—Contract No. 1—Water storage tank and supports, water purifying and softening plant, steam feed pump and pipework. Contract No. 2—Removal and re-erection in new building of existing condensers and feed pumps, &c., and pipework. Persons are at liberty to tender for one or both contracts, but not for part of one contract. Copies of the specifications with forms of tender, general conditions and plans may be obtained from C. H. Fry, clerk to the Council, Council Offices, Bexley Road, Erith, on depositing the sum of £5. Plans and specifications can be seen, but not obtained, at the offices of Hawtayne & Zeden, consulting engineers to the Council, 9, Queen Street Place, London, E.C. Tenders sealed and marked "Tender for Electricity Supply Works Extensions," to be addressed to C. H. Fry, and delivered on or before 12 o'clock noon on Oct. 29.

Oct. 30. Norway.—*Supply and erection of about 35 tons of iron bridge work* for the Norwegian Government Commission of Roads and Bridges. Tenders, in sealed envelopes, marked "Anbud paa Jernfagvaerksbro" are to be delivered at "Veidirektorens Kontor, Akers Gade 42lv, Christiania," by midday on Oct. 30. Copies of the general conditions of tender to the Norwegian Government, and the special conditions, form of tender, and specification for the above contract may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E C.

Oct. 30. Langdon.—*Construction of a covered service reservoir* at Langdon, and the supply, delivery, laying and jointing of about 3 miles 800 yards of 4-in. and 3-in. cast-iron socket pipes with appendages, including all necessary sluice and air valves, hydrants, and other works for the water supply of the town of Beaminster. Drawings, specifications and conditions may be seen at the offices of Messrs. Beesley, Son & Nichols, MM.Inst. C.E., engineers, 11, Victoria Street, Westminster, S.W., where also specifications, bills of quantities, and forms of tender may be obtained on deposit of £5. Copies of the plans and specification may also be seen at the offices of R. Leigh, clerk to the Beaminster Rural District Council, Beaminster, Dorset (Saturdays excluded). Sealed tenders addressed to R. Leigh, and endorsed "Beaminster Waterworks," "Contract No. 2," are to be delivered before 10 a.m. on Oct. 30.

Oct. 31. Pontevedra.—*Supplying electric light* to the town of Pontevedra for a period of 15 years from 12th April, 1908. The upset price the municipality will pay is 20,000 pesetas annually. Tenders will be received up to 11 a.m. on Oct. 31, at the Palacio Municipal, Pontevedra, and at the Direccion General de Administracion Local at Madrid. The *Gaceta* of Sept. 21 contains further information as to the terms of the contract, as well as a copy of the form of tender, which may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Oct. 31. Portaferry.—*Construction of a pier* at Portaferry, in accordance with the drawings and specifications of the County Surveyor, at a cost not exceeding £450, for the Council of the Administrative County of Down. Copies of the plans and specifications can be seen at the County Courthouse, Downpatrick, on any week day, between 10 a.m. and 5 p.m. Tenders must be sent in on forms obtained of R. MacIlwaine, secretary to the County Council, Council Offices, Courthouse, Downpatrick, and are to be endorsed "Tender for Portaferry Pier." Such tenders will be received until 3 p.m. on Oct. 31, and parties sending in tenders will require to be in attendance, with two sufficient sureties, at the Council Chamber, Courthouse, Downpatrick, on Nov. 1, at 10.30 a.m., to enter into a bond for the due performance of the work.

Nov. 5. Portsmouth.—*Supply, provision, erection, setting to work, and maintenance* of electrically-driven centrifugal storm water pumps, with their switchgear and the accessaries of the whole or any of them, to be erected in an underground pumping station to be built on Southsea Common. Specifications and forms of tender may be obtained from the Town Clerk on payment of a sum of £2 2s., and the drawings may be seen and full information supplied upon application at the offices of Bramwell & Harris, 5, Great George Street, Westminster, S.W. Tenders under seal and endorsed "Tender for Works for the Prevention of Storm Water Flooding in the low lying area of Southsea.—Contract No. 1," must be delivered to Hellard, town clerk, Town Hall, Portsmouth, on or before 12 o'clock on Nov. 5.

Nov. 6. Peoria, Illinois.—*Construction of the superstructure work* of a Scherzer rolling lift bridge across the Illinois River at Peoria, Illinois, will be received until 12 o'clock, Nov. 6. Plans can be examined and specifications and blank forms for proposals can be obtained at the office of E. A. Furry, Commissioner of Public Works, Peoria, Illinois, or at the office of the Scherzer Rolling Lift Bridge Company, Monadnock Block, Chicago, Illinois.

Nov. 12. Yorkhill.—*Construction of about 1,164 lineal yards of quayage*, at Yorkhill, on North Side of the Harbour of Glasgow, for the Trustees of the Clyde Navigation, the work embracing quay walls on monolith foundations, ordinary quay walls, timber wharf, ferro-concrete wharf, and nearly 300,000 cubic yards of excavation. The drawings may be seen, and specification, schedule of quantities and form of tender obtained on application to W. M. Alston, the trustees' engineer, 16, Robertson Street, Glasgow, on a deposit of £5 5s. Sealed tenders, marked "Tender for Yorkhill Basins and Quays," to be lodged with T. R. Mackenzie, general manager and secretary, 16, Robertson Street, Glasgow, not later than 10 a.m. on Nov. 12.

Nov. 20. Winnipeg.—*Erection of steel superstructure for highway bridge* over the Red River, at Redwood Ave., Winnipeg. Sealed proposals addressed to Alderman J. G. Latimer, Chairman, Committee on Works, will be received at the office of C. J. Brown, city clerk, City Clerk's Office, Winnipeg, up to 2.30 p.m. on Nov. 20. Plans, specifications and forms of proposal may be obtained at the office of Col. H. N. Ruttan, city engineer, Winnipeg, Canada. Each bid must be accompanied by an accepted cheque or draft payable to the order of the City treasurer, or cash deposit for a sum equal to 5% of the total amount of the bid, which will be subject to forfeiture in case of failure on the part of the contractor to enter into a written contract with approved sureties if called upon to do so.

Nov. 21. Brockton, Mass.—*Furnishing and erecting complete*, on foundations furnished by the city one vertical triple-expansion condensing, crank and flywheel pumping engine of six million gallons daily capacity. Sealed proposals, endorsed "Proposals for Pumping Plant," will be received at the office of the Water Commissioners, City Hall, Brockton, Mass., until 12 o'clock noon on Nov. 21. Each proposal must be accompanied by a certified cheque drawn and made payable to the City of Brockton, for the amount of 1,000 dols. Proposals must be made on blank forms furnished by the Water Commissioners. Blank proposals and specifications and further information will be furnished on application to the Water Commissioners.

IRON AND STEEL.

Nov. 10. Accrington.—*Supply of about 1,350 tons of steel tramway rails*, together with the necessary fish-plates, &c., for the Tramway Committee. Specifications, form of tender and other particulars may be obtained on application to the Borough Engineer, W. J. Newton, Assoc.M.Inst.C.E., Town Hall, Accrington, on payment of a deposit of £2 2s. Sealed tenders, endorsed "Tramway Rails," to be delivered to A. H. Aitken, town clerk, Town Hall, Accrington, not later than Nov. 10.

Nov. 12. Holyoke, Mass.—*Supplying 139 net tons of 20-in.*, 281 net tons of 16-in. and 32 net tons of 12-in. cast iron water pipe and 20,000 lbs. of special castings. Tenders will be received at the office of the Board of Water Commissioners, Room 8, City Hall, Holyoke, Mass., until 7.30 p.m. on Nov. 12. Specifications and proposal forms may be obtained on application.

No date. London.—*Supply and erection* of the steel skeleton framing of a proposed factory in London, 410ft. long, 86ft. wide, and six storeys high. Persons desirous of tendering please apply to R. Anderson, architect, 39, Victoria Street Westminster, for copy of drawings and particulars, which will be supplied on a deposit of £2 2s. Only a limited number will be issued.

PAINTING AND PLUMBING.

FIRE SUPPLEMENT (MONTHLY).

FIRE-RESISTING GLAZING.

We have, from time to time, referred to the great importance of fire-resisting glazing, and the glazing that has been under review in respect to its fire-resistance has been mainly either of the wire-glass type or of the electro-glazing type.

Nearly every time that we have mentioned any test with this form of glazing it has been shown that there has been an improvement both in the glazing and in the manner in which the glazing is inserted in the casements, as also in the casements themselves.

In the current issue we publish a test of a most remarkable kind that has been recently undertaken with Mississippi wire-glass—i.e., glass by the Mississippi Wire-glass Company, of New York, U.S.A., who make a speciality of this form of glazing for the Western Hemisphere.

This test, as the preamble signed by Mr. Ellis Marsland and Mr. James Sheppard indicates, has again demonstrated the important fact that window openings can be protected by wired glass so as to prevent the passage of flame that may continue to burn against one side for 90 minutes.

The achievement of 90 minutes is, indeed, a record. We believe the first tests with wire glass only aspired to afford resistance for half an hour. Following this there was a record of 45 minutes, then one of one hour, and now we actually find that this wired glazing, both opaque and transparent, will withstand a fierce fire of a temperature of over 1,500 deg. Fahr. for a period of a full hour and a half, and also withstand the application of water applied for two minutes from a steam fire engine.

The test in question has been conducted by the British Fire Prevention Committee under its usual conditions, and all who have witnessed these tests realise what a fire of this temperature means. It is true that in the test particularly under review—namely, that of 90 minutes—one out of three openings filled with wire glass failed, but the failure to our mind was in that case not attributable to the glazing, but to the unsatisfactory fixing in what we would consider a somewhat unsuitable frame.

The glazing fixed in a well-made hollow frame let neither fire nor water pass through the glazing. The solder to the metal sashes and frame was melted and the name plate on the casement dropped off, but the glazing remained sound and only showed the usual innumerable hair cracks. The same can be said of the wire glazing that was put into a brick reveal, and it is only in the opening where there was an unsatisfactory casement that we find it recorded that the glazing drew away from the rebate at the top and partly melted along the top edge, which meant bulging, cracking and letting the fire pass through.

It would be, perhaps, a point to remark that, as a matter of fact, the glass which withstood the 90 minutes' test was subject to more than usually severe strain, for owing to the bulging of the one casement the temperature in the passage away from the fire, which was to be protected by the ¼-in. glazing, rose to 1,200 deg. Fahr., and the glazing that remained intact had thus an actual fire on the one side and a high temperature on the other.

With the growing demand for larger buildings and the requirements of greater cubic contents, it is obvious that the question of glazing will play an all-important rôle in the development of our large cities, and it will be glazing and shutters combined that will probably in the future prevent the spread of fire from house to house, and more particularly across small areas and courts.

The makers of the glazing in question should thus be congratulated upon their manufactures, and we have not the slightest doubt that the examples shown by our American cousins will be very quickly followed, if not surpassed, by the well-known makers of wire-glass in this country. A stimulant from the United States of this description can only be described as healthy, and we still anticipate seeing strides made in the perfection of wire-glass at home.

There is one point, however, to which we would like to call attention—namely, that obviously there must be great radiation of heat through the slight ¼-in. thickness of a piece of wire-glass, and the textiles actually against the glass would probably catch fire. It will then be well to keep in mind the suggestion made by Messrs. Ellis Marsland and James Sheppard, that in certain cases double glass, or double casements or frames, should be applied, particularly in positions liable to be exposed to fierce flame and great heat. This suggestion should have particular application to small areas in our warehouse districts and in respect to the glazing in lift shafts.

Details of the Test.

Above we deal with the general aspect of the wire-glass tests recently conducted by the British Fire Prevention Committee, and we here would only present in short the "Object of Test" and "Summary of Test" of the two investigations conducted by that body.

The first test was one 45 minutes' duration, the second one 90 minutes' duration; and in each case the glazing in three window openings was under review. The second test being the more interesting, we present in that case not only the "Object" and "Summary" of the test, but particulars of the casements and frames used, which, of course, played an important rôle.

Object of First Test.

To record the effect of a fire of 45 minutes' duration, the temperature to reach 1,500 deg. Fahr. (815.5 deg.), but not to exceed 1,650 deg. Fahr. (898.8 deg.), followed by the application of water for two minutes, with the view of being classified as affording temporary protection (Class A).

Note.—The openings were numbered, Nos. 1, 2 and 3.

Opening No. 1 was filled in with a teak frame, divided into two squares, into which the glass was fixed with teak beads.

Opening No. 2 was filled in with a steel frame with two steel casements, into each of which a square of glass was fixed.

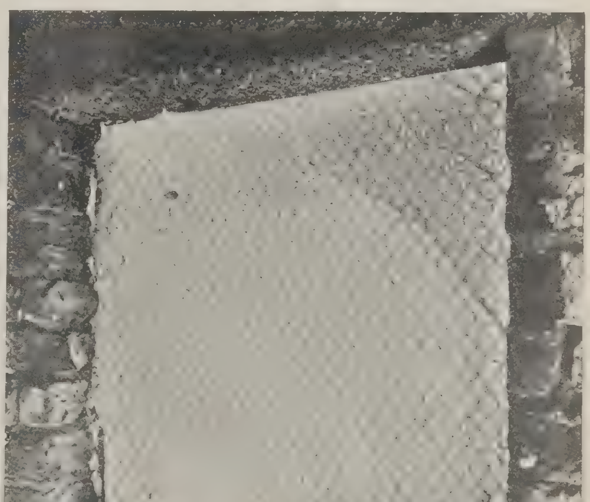
Opening No. 3 was filled in with a metal-cased frame and two sliding sashes; each sash was divided into two squares, into which the glass was fixed.

Summary of First Test.

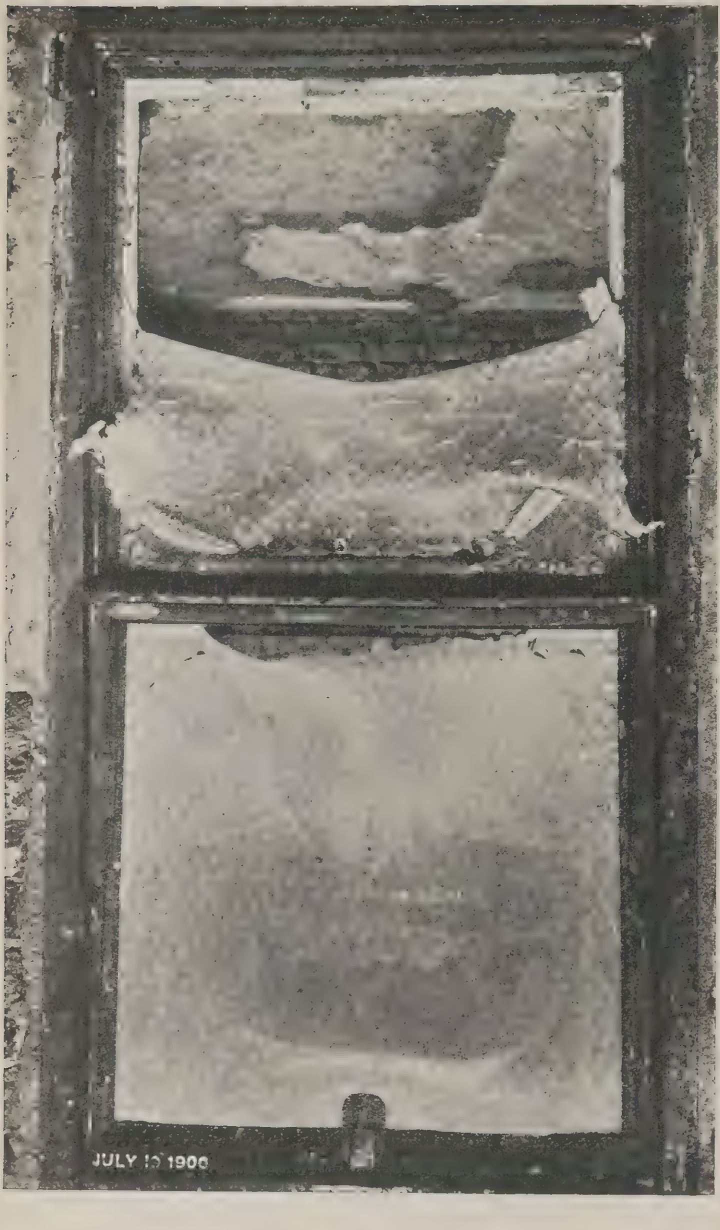
Immediately on lighting the gas the glass in each opening commenced to crack in various directions, and continued to do so during the test.

Opening No. 1.—Fire did not pass through the glass. Smoke passed between the glass and frame. The upper part of the frame was charred on the outside during the test, and at its conclusion burst into flame. The glass remained in position after the application of water, but subsequently the lower square fell outwards on being tapped.

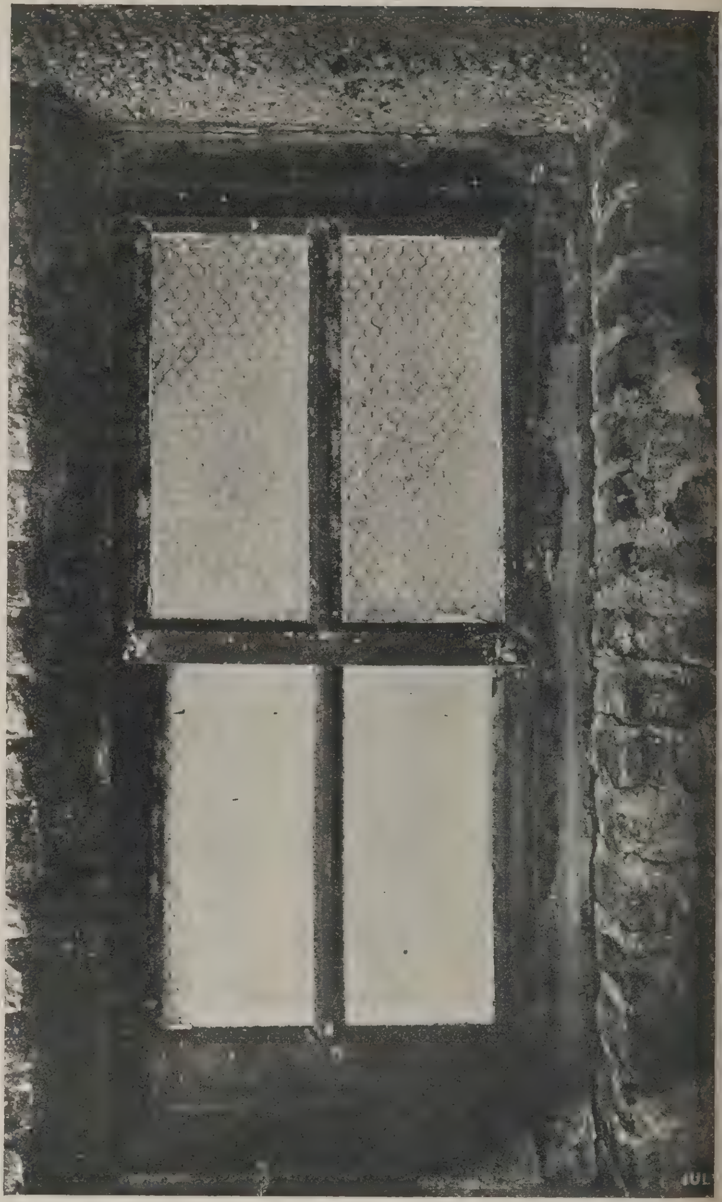
Note.—During the night the upper square of glass fell. Both squares remained unbroken, and were replaced as shown in Fig. 9.



OPENING NO. 1. IN THE SECOND TEST: FROM THE FIRE SIDE AFTER 90 MINUTES TEST.



OPENING NO. 2 IN THE SECOND TEST: AFTER 90 MINUTES, FROM THE FIRE SIDE.



OPENING NO. 3 IN THE SECOND TEST: AFTER 90 MINUTES, FROM THE FIRE SIDE.

Opening No. 2.—Fire did not pass through the glass. The steel angle frame and casement were uninjured, with the exception of being slightly twisted. The glass remained in position. Smoke passed between the frame and the brickwork and between the meeting bars of the casement. Smoke was given off on the outside from the putty.

Opening No. 3.—Fire did not pass through the glass. The sheet steel hollow frame and sashes were intact, and the glass was in position. Smoke passed between the frame and brickwork, and smoke was given off by the putty. Solder used at angle joints and for fixing metal name plate on the outside was melted.

Classification was obtained as affording "temporary protection (Class A)."

Object of Second Test.

To record the effect of a fire of 90 minutes' duration. The temperature to reach 1,500 deg. Fahr. (815.5 deg. C), but not to exceed 1,650 deg. Fahr. (898.8 deg. C), followed by the application of water for two minutes, with the view of being classified as affording partial protection (Class A).

Note.—The openings were numbered, Nos. 1, 2 and 3.

Opening No. 1 was filled in with one square of glass, fixed directly into a brick reveal.

Opening No. 2 was filled in with a steel frame with two steel casements, into each of which a square of glass was fixed.

Opening No. 3 was filled in with a metal-cased frame and two sliding sashes; each sash was divided into two squares, into which the glass was fixed.

Summary of Second Test.

Immediately on lighting the gas the glass in each opening commenced to crack in various directions, and continued to do so for some time during the test.

The glass in the openings remained in position during the test.

On the application of water the glass became sintered all over.

Opening No. 1.—Neither fire nor water passed through the glass.

There was a bulge inwards of about ½in. (.012 metre).

Opening No. 2.—On the expiration of 60 minutes the glass in the opening was intact, save for the cracks mentioned.

In 65 minutes the glass in upper casement began to bulge.

In 70 minutes the glass in lower casement began to bulge.

In 84 minutes the glass in upper casement had drawn sufficiently out of rebate to let flame through.

In 87 minutes the glass in lower casement had drawn sufficiently out of the upper rebate to let flame through.

The glass in upper casement dropped away from rebate and curved inwards for about half its depth.

On the application of water the glass remained in the casement, although damaged and bulged.

The steel casement was slightly buckled in places.

Opening No. 3.—Neither fire nor water had passed through the glass.

The solder to the metal sashes and frame was melted, and the name plate dropped off.

Classification, partial protection (Class A) was obtained in openings No. 1 and 3.

Description of the Frames and Glazing used in the Second Test

Opening No. 1.—Sight size, 2ft. 3in. by 2ft. 3in. (.68 by .68).

The glass in opening No. 1 was "Maze" wired-glass ¼in. (.006 metre) thick, and was glazed directly into the brick reveal by being bedded in a com position of asbestos and plaster.

The size of the square was 2ft. 6in. b 2ft. 6in. (.7619 metre by .7619 metre), and its area 900 sq. in. (.58 sq. metre).

Opening No. 2.—Sight size, 2ft. 3in. by 4ft. 6in. (.68 metre by 1.37 metres).

The glass in opening No. 2 in two squares; the upper square was of rolled plate-wired glass ¼in. (.006 metre) thick, and that in the lower square was polished plate-wired glass ¼in. (.006 metre) thick. Each square was glazed with putty into a steel angle casement and secured by a steel angle fillet screwed to the casement. The casements were fitted to a steel angle frame, one being hung on centres and the other being fixed.

The size of each square of glass was 2ft. 0¾in. by 2ft. 0¾in. (.6285 metre by .6285 metre), and its area was 612 sq. ins. (.42 sq. metre).

Opening No. 3.—Sight size, 2ft. 3in. by 4ft. 6in. (.68 by 1.37 metres).

The glass in opening No. 3 was glazed with putty into two sliding hollow metal sashes, each divided into two squares, and secured by a metal fillet on centre bar. The glass in the two upper squares was "Maze" wired-glass ¼in. (.006 metre) thick, and the glass in the two lower squares was polished plate-wire glass ¼in. (.006 metre) thick. The sashes were fixed in a hollow cased frame of galvanised sheet steel.

The size of each square of glass was 22in. by 9in. (.5587 metre by .2286 metre), and its area was 198 sq. ins. (.12 sq. metre).

SKYLIGHTS.*

American Rules.

In considering the question of skylights it has been thought advisable to include not only skylights, their construction, protection and arrangement, as well as the types of buildings or roofs on which they are used, which necessarily constitute a factor to be taken into consideration, but to enlarge the scope so as to include all roof openings. While the object of this committee is primarily to provide proper safeguards against fires from exposures, liable to endanger a risk through roof openings, the guarding against the spread of fire arising within the building, through improperly constructed skylights, has been kept in view in so far as the type of building, or its construction would warrant.

While it is important to establish a standard in these, as in all other matters relating to protection against losses from fires, there are numerous existing conditions relating to the construction of buildings and materials employed, and the purposes for which they are used, which must be recognised, and it has been the object to keep all of these conditions fully in mind.

For this reason several broad classifications in construction have been considered, viz.: Type of building—fire resistive, slow-burning, ordinary brick or frame; kind of roofs—fire resistive, slow burning, ordinary light construction with approved covering, as well as shingles; purposes for which buildings are used; and, to a minor extent, location, height and exposures.

In drawing up this report various local requirements have been considered and the suggestions of the National Board of Fire Underwriters' Building Code have been kept in view in order to maintain uniformity.

The following kinds of roof openings have been taken under consideration: Skylights—flat, plane or inclined, peaked, cupolas, domes, monitors or lanterns, vertical or pitched saw-toothed roofs, raised sections of roofs with sash, and dormer windows; also suitable arrangement for protection of sash in side or top openings or raised skylights; ventilators, door landings, pent houses or bulkheads; scuttles; and lights over bottoms of light shafts or wellholes open at top.

For buildings of standard fire-restive or slow-burning (mill) construction (except over stair, elevator or dumbwaiter shafts and theatre stage roofs, which see), approved wired glass, not less than ¼ inch thick, properly secured in metal sash, set in metal frames, or glass not less than ½ inch thick, similarly secured, provided it is protected by suitable wire screens, should be used on all plane skylights and skylights inclined at an angle of not over 45 degrees. In vertical skylights or sash, or such as are inclined at an angle of over 45 degrees, glass not less than ¼ inch thick may be used secured as noted above, provided the skylights or sash are protected by suitable screens; if, however, such skylights be exposed in such a manner that wall openings in buildings would require standard fire shutters or standard wire glass sash (or doors) against such exposure, wired glass only to be used.

The above described kinds of skylights are recommended on all other classes of buildings.

All skylights other than those indicated above, ventilators or ventilating openings on roofs. should be protected by screens of steel wire cloth woven (not twisted), galvanised after weaving, properly secured to strong iron frames, preferably galvanised if used for protection of skylights, or otherwise properly secured to ventilators.

Door landings, pent houses or bulkheads on roofs should be constructed of approved fire resistive materials throughout in proper manner if on buildings of fire-resistive construction, or properly fireproofed if on other buildings.

Scuttle covers should be similarly treated.

Lights over bottoms of light shafts or wellholes open on top should be of ½-inch approved wired glass or ¾-inch thick glass, properly protected by wire screens, securely set in strong metal frames, or of prism lights set in cast iron frames of sufficient strength and properly secured. The tops of such shafts should be protected by approved wire screens as noted above.

General Plan Governing the Arrangement of Rules.

Class A. Skylights. Types.

CONSTRUCTION.

1. Glass.—(*a*) Plane skylights, or such as are inclined not over 45 degrees. (*b*) Vertical skylights or sash, or such as are inclined at an angle of over 45 degrees. (*c*) For vertical skylights or sash, or sash inclined at an angle of over 45 degrees. when exposed. (*d*) For skylights over fireproof stair, elevator dumbwaiter, air or similar shafts. (*e*) For skylights over stage sections of theatres.

2. Sash. (*a*) Materials. (*b*) Construction. (*c*) Glazing,

3. Frames.

4. Curbs. (*a*) On buildings of fire-resistive construction. (*b*) On buildings of slow burning construction. (*c*) On other types of buildings. (*d*) Manner of fastening

5. Monitor or lantern skylights. (*a*) Construction. (*b*) Sash. (*c*) Frames.

(6) Sawtoothed skylights. (*a*) Construction. (*b*) Sash.

7. Vertical sash under raised sections of roofs.

8. Ventilating skylights or skylight sash. (*a*) Hinged sash. (*b*) Pivoted sash (*c*) Protection.

9. Windows in roof structure.

0. Dormer windows. (*a*) Construction. (*b*) Sash and frames.

11. Skylights on stair. elevator. dumbwaiter, light, air, and similar shafts. (*a*) Construction. (*b*) Glazing (*c*) Ventilation.

12. Theatre stage skylights. (*a*) Construction. (*b*) Glazing. (*c*) Operating. (*d*) Types—1, counterbalanced; 2, rolling. (*e*) Protection.

PROTECTION.

13. Wire cloth. (*a*) Kinds. (*b*) Sizes to be used for different types of skylights and under different conditions, items 1, 2, 3, 4, 5, 6, and 7.

14. Securing wre cloth.

15. Frames. (*a*) Materials for varying size of screens, 1, 2, 3, 4, and 5. (*b*) Re-inforcing. (*c*) Supports. (*d*) Braces. (*e*) Construction—1, rods; 2, pipes; 3, angles. (*f*) Securing frames.

16. Distance of screens from skylights. (*a*) Top lights (*b*) Side lights.

17. Raised skylights.

18. Vertical or sawtoothed skylights, &c.

19. Removable screens.

Class B. Ventilators. Types.

20. Materials.

21. Construction and protection. (*a*) Flue ventilators, 1, 2, 3, manner of protection. (*b*) Lower ventilators, &c. c) Ventilating monitors, &c. (*d*) Frame ventilators, &c.

Class C. Doorlandings, Pent Houses or Bulkheads,

22. (*a*) On buildings of fire-resistive construction. (*b*) On buildings of slow-burning construction. (*c*) On other types of buildings.

Class D. Scuttles.

23. Construction. (*a*) On buildings of fire-resistive construction. (*b*) On buildings of slow-burning construction. (*c*) On other types of buildings.

24. Fastening.

25. Stops.

26. Ladders.

Class E. Open Air or Light Shafts.

27. Lights.

21. Protection of shafts.

CLASS A. SKYLIGHTS.

Roof Openings.

Types: By the term skylights as employed in this report is meant any opening through roof of building for the admission of light.

The following types with their modifications and combinations, which are included, are noted: Flat skylights, plane or inclined; peaked skylights; cupola skylights; monitor and lanterns; saw-toothed roofs; raised sections of roofs with vertical sash: ventilating skylights; dormers. &c.; also special skylights, as over stair, elevator or dumbwaiter shafts, and over stage portions of theatres.

Construction.

1. Glass.—(*a*) For all skylights, plane or inclined not over 45 degrees. to be either of standard wired glass not less than ¼-in. thick or ½-in. thick glass protected with approved wire screens. Panes to be not over 18ins. or 20-ins. wide, and not to exceed 720 sq. ins. in area.

(*b*) For vertical skylights or sash, or such as are inclined at an angle of over 45 degrees, may be wired glass as noted under (*a*), ½-in. thick glass without screens, or glass not less than ¼-in. thick, provided the sash or skylights are protected by suitable screens.

(*c*) For vertical skylights or sash, or such as are inclined at an angle of over 45 degrees, when exposed in such a manner that the wall openings in buildings would require standard fire shutters or standard wired glass (or doors) against such exposures, standard wired glass only should be used.

(*d*) For skylights over fireproof stair, elevator, dumbwaiter, air or similar shafts not over ⅛-in. glass, either on top or at sides of cupola skylight, if surmounted by that type, protected by suitable screens.

(*e*) For skylights over stage sections of theatres not over ⅛-in. glass, protected by suitable screens.

NOTE.—Substitutes for glass, such as "Translucent Fabric" or similar materials, are not approved, and shall be considered as ⅛-in. thick glass; not permitted, however, where ⅛-in. thick glass is specified.

2. Sash.—(*a*) Materials. Sash to be constructed entirely of metal, either galvanised iron, wrought iron, or angle iron.

(*b*) Construction. To be constructed in accordance with the rules and requirements of the National Board of Fire Underwriters for wired glass windows.

(*c*) Glazing. Glass to be secured to the sash by means of metal strips held in position by bolts or screws in such a manner as to form joints sufficiently elastic to allow for proper expansion and contraction and to be weather proof.

3. Frames.—Frames for low, flat or small cupola skylights to be entirely of galvanised iron secured to angle irons, all properly riveted together and securely fastened to roof. All joints to be tight and weather proof.

4. Curbs for Skylights.—(*a*) If on buildings of fire-resistive construction to be constructed of approved fire-resistive materials reinforced with angle iron properly protected by approved fire-resistive material.

(*b*) If on buildings of slow-burning construction may be either (1) of not less than 4×4-in. framework, filled in with brick, terra cotta, cement, or other approved fire-resistive materials, tin-clad on the outside; (2) double boarded, tongued and grooved, boards at right angles to each other, tin-clad on the outside; (3) of not less than 2¾-in. tongued and grooved, or splined plank, tin-clad on the outside.

(*c*) On all other buildings, if not in accordance with the foregoing, and of frame, to be thoroughly tin-clad on the outside.

(*d*) Curbs must be securely fastened to framework of roof, and when on roofs of joisted construction should be supported on double joists.

5. Monitor or Lantern Skylights.—(*a*) Construction. To conform in general with roof construction of buildings of which they form a part, and as specifically noted under Curbs, section 4, class A.

(*b*) Sash. To conform in all particulars to sections 1 and 2, class A.

(*c*) Frames. (1) If for skylights on top of monitors or lanterns to conform with section 3, class A. (2) If in sides of monitors or lanterns of fire-resistive construction to be constructed in accordance with the rules and requirements of the National Board of Fire Underwriters for wired glass windows. (3) For all monitors or lanterns where woodwork is permissible, see under (a), this section, the frames, if of wood, should be thoroughly protected by galvanised iron, including the rabbets, if any, or recessed portions, receiving the sash.

6. Sawtoothed Skylights.—(*a*) Construction. To conform in general with roof construction of buildings of which they form a part, and as specifically noted under Curbs, section 4, class A.

---

* Report of a Committee appointed by the United States National Fire Protection Association.

(*b*) Sash. To conform in all particulars with sections 1 and 2, Class A.

Note.—Usually this type of skylight is one continuous frame. The muntins or rails should conform in manner of construction and securing to the requirements laid down in the rules for wired glass sash by the National Board of Fire Underwriters. Any deviations of this arrangement will be governed by the rules or requirements of the types or kinds under which they may come.

7. Vertical Sash under Raised Sections of Roofs.—This includes also a row of sash or sections of wall entirely of glass, above the wall proper and underneath the roof.

Should conform in general with the rules and requirements noted under sections 5 and 6, class A, in so far as these apply.

8. Ventilating Skylights or Skylight Sash.—Frequently portions of skylights (sometimes the entire sash) are arranged that they may be opened for purposes of ventilation; if top sash are so arranged they are generally hinged at the highest point, while side sashes are hinged either at the top, or near the centre line, turning either on a horizontal or vertical axis. Sashes hung at the top are usually secured by hinges, those hung near the central line by trunnions or pivots.

(*a*) Hinged sash. To be provided with hardware, and hung and arranged in such a manner as to conform to the rules and requirements of the National Board of Fire Underwriters for wired glass sash.

(*b*) Pivoted Sash. To be provided with hardware, and hung and arranged in such a manner as to conform to the rules and requirements of the National Board of Fire Underwriters for wired glass sash.

(*c*) Protection. All ventilating skylights or skylight sash should be protected by wire cloth screens as specified, in such a manner that the screen will allow full freedom of operation. In no case should the operation of the sash require the removal of the screen or any portion of the same. The screens should be entirely independent of this type of skylights or sash and shall be of ample size to completely protect the opening.

9. Windows in Roof Structure.—All window openings in roof structures, such as shafts extending above roofs, pent houses, high curbs, ends of sawtoothed or monitor or lantern skylights, &c., should conform to sections 1, 2 and 5, class A, in so far as these apply.

10. Dormer Windows.—(*a*) Construction. To conform in general with roof construction of buildings of which they form a part, and as specifically noted under Curbs, section 4, class A.

(*b*) Sash and Frames. To conform in all particulars to sections 1 and 2 and section 5, class A, respectively, in so far as these apply.

11. Skylights on stair, elevator, dumbwaiter, light, air and similar shafts, if of fire-resistive construction and cut off from buildings. (*a*) Construction. To be constructed with metal frames and sash in accordance with sections 3 and 2, class A.

(*b*) Glazing. Top sash of cupola skylights, if any, to be glazed with wired glass, or $\frac{1}{2}$-in. thick glass protected, see section 1, class A; sides should be glazed with glass not over $\frac{1}{8}$in. thick, plane skylights to be glazed with glass not over $\frac{1}{8}$in. thick; protected by suitable wire screens. Glazing to be done in accordance with section 2, class A.

(*c*) Ventilation. Where ridge ventilators or louvres in ends or sides of such skylights are provided, these should be protected by suitable wire cloth screens, properly secured.

12. Theatre Stage Skylights.—(*a*) Construction. Curb or frame, and sash to be constructed in accordance with the rules and requirements of sections 2, 3 and 4, class A.

(*b*) Glazing. To be glazed with glass not over $\frac{1}{8}$in. thick, in accordance with section 2, class A, each pane measuring not less than 300 sq. in.

(*c*) Operating. Sash to be in two movable sections so arranged as to open readily by the action of heat from below on a fusible link or series of links; or similar device, which upon parting will allow the sash to open automatically, and also by means of the cutting of a hempen cord, extending to the stage floor and within reach of fly gallery.

(*d*) Types. Two types of skylights for this purpose are suggested.

(1) Two counterbalanced sashes, hinged to the outer edges of the curbing or frame, which should be slightly hip shaped, the upper edges coming together when sashes are closed, and arranged in such a manner that one is provided with an overhanging lip or batten to keep out the weather. Each sash to have extension rods or bars at the lower (hinged) edge, projecting beyond the curb for a distance not less than the width of the sash, to which bars should be securely attached a weight not less than 50 per cent. heavier than the weight of the sash. Hinges to be of heavy brass, bolted to the sash and curb or frame, and set well back from the edges of the frame.

(2) Two rolling sashes, fitted with brass wheels not less than $2\frac{1}{2}$in. in diameter, set inside of outer edge of sash for a distance of not less than 2ins., well secured to sash. The wheels to run on brass tracks properly secured to the curb or frame and rails extending beyond same on either side to roof. Curb or frame to be hip shaped, the slopes to be such that the sash shall be inclined at not less than an angle of 30 degrees.

The height of the curb or frame shall be such that the lowest portion of the tracks on which the sash slide, shall not be less than 12in. above the roof.

(*e*) Protection. Either type of skylight for this purpose shall be protected by suitable steel wire cloth, properly secured in such a manner as not to interfere with the operation of the sash and sufficient size to cover the entire opening properly, as well as to protect the sliding sash when open.

Protection.

All skylights, except those glazed with wire glass, or glass $\frac{1}{2}$in. thick or over, when inclined at an angle of 45 degrees or vertical (unless exposed as noted under section 1, rule c, class A) should be protected by wire screens of galvanised steel wire cloth.

13. Wire Cloth.—(*a*) Kind. All wire cloth shall be woven (not twisted) of steel wire, galvanised after weaving.

(*b*) Sizes. (1) For plane skylights, or skylights inclined at an angle of 45 degrees or less, glazed with $\frac{1}{2}$-in. thick glass, cloth of not lighter than No. 12 wire and not over $\frac{3}{4}$-in. mesh shall be used.

(2) For plane skylights, or skylights inclined at an angle of 45 degrees or less, glazed with glass not less than $\frac{1}{4}$in. thick, but less than $\frac{1}{2}$in. thick, cloth of not lighter than No. 12 wire and not over $\frac{3}{4}$in. mesh shall be used.

(3) For plane skylights, or skylights inclined at an angle of 45 degrees or less, glazed with glass less than $\frac{1}{4}$in. thick, cloth of not lighter than No. 12 wire and not over $\frac{3}{4}$in. mesh shall be used.

(4) For vertical skylights or sash, or such as are inclined at an angle of over 45 degrees (except when glazed with glass not less than $\frac{1}{2}$in. thick), glazed with glass not less than $\frac{1}{4}$in. thick, unless exposed, cloth of not lighter than No. 12 wire and not over $\frac{3}{4}$in. mesh shall be used.

(5) For vertical skylights or sash, or such as are inclined at an angle of over 45 degrees (except when glazed with glass not less than $\frac{1}{2}$in. thick) glazed with glass less than $\frac{1}{4}$in. thick, unless exposed, cloth of not lighter than No. 16 wire and mesh not over No. 3 ($\frac{1}{3}$in.) shall be used.

(6) For vertical skylights, or such as are inclined at an angle of over 45 degrees, if exposed as per section 1, rule c, class A, unless glazed with wired glass, cloth of not lighter than No. 12 wire and not over $\frac{3}{4}$-in. mesh shall be used.

14. Securing Wire Cloth.—All wire cloth shall be securely fastened to frames by means of galvanised iron wire or by means of special metal strips and rivets, bolts or screws.

15. Frames.—(*a*) Frames for wire cloth screens shall be constructed of iron rods, pipes or angles as follows: (1) For screens not over 3ft. in any direction, $\frac{3}{8}$-in. rods, $\frac{1}{4}$-in, pipe or $\frac{1}{2}$-in. angles. (2) For screens over 3ft. and under 4ft. in any direction, $\frac{1}{2}$-in. rods, $\frac{3}{8}$-in. pipes or $\frac{3}{4}$-in. angles. (3) For screens over 4ft. and under 6ft. in any direction, $\frac{5}{8}$-in. rods, $\frac{3}{4}$-in. pipes, or 1-in. angles. (4) For screens over 6ft. and under 10ft. in any direction, 1-in. rods, $1\frac{1}{4}$-in. pipes, or $1\frac{1}{2}$-in. angles. (5) For screens of larger sizes, proportionately larger sized materials are to be used, in which case angles are to be preferred.

(*b*) Reinforcing. Where dimensions exceed 3ft. in any direction, cross bars, placed not over 3ft. apart, or over 3ft. distant from outer bars, shall be provided for reinforcing the frames. These reinforcing bars shall conform in size to the rods, pipes or angles under (*a*), this section, increasing in size as noted according to span.

(*c*) Supports. Upright supports, to correspond with materials specified under (*a*), this section, and at end of each re-enforcing member, and to be not less in size than the bars supported.

(*d*) Braces. All enclosing frames over 3ft. high and more than 6ft. in length shall have braces extending from the upper angles to the base line, one in each corner of each side.

(*e*) Construction. The frames should be strongly assembled.

(1) If constructed of rods these should be welded together, or threaded and securely joined by threaded malleable iron fittings, and uprights shall be properly shaped at lower ends to permit fastening by means of screws; or if size permits, to be threaded and provided with threaded malleable iron base or foot plates, drilled for three bolts or screws each.

(2) If constructed of pipes, these should be threaded and secured by means of threaded malleable iron fittings, and uprights shall be threaded and provided with threaded malleable iron base or foot plates, drilled for three bolts or screws each.

(3) If constructed of angle irons these should be welded together or fastened at the corners by fillet angles securely riveted in place. Uprights to be shaped at base to permit fastening by at least four screws or bolts each.

(*f*) Securing frames. All frames for screens to be secured to roofs or frames of permanent skylights, monitors, lanterns, &c., by means of lag screws or bolts.

16. Distance of Screens from Skylights, &c., to be Protected.—(*a*) All screens shall be placed 6ins. or over above skylights to be protected, and shall project the same distance beyond edges of the skylight it is raised above.

(*b*) All screens used for protecting side lights shall be placed not less than 6ins. from lights or openings so protected.

17. Raised Skylights.—Screens for raised skylights having top and side sash contiguous shall have the frames on top secured to those on the sides as noted under (*e*), section 15, and wire cloth shall cover the entire framework and come within 6ins. of roof.

18. Vertical or Sawtoothed Skylights or Sash, or Those Inclined at an Angle of over 45 Degrees.—Screens for vertical or sawtoothed skylight or sash, or those inclined at an angle of over 45 degrees, shall be returned at the top and sides in such a manner as to exclude embers or sparks from span between the screens and glass.

19. Removable Screens.—Where for any purpose it becomes necessary that screens or portions of screens used in protecting side lights must be removable these screens or portions of screens shall be framed as specified under section 15, and similarly constructed frames placed around such openings. Such screens or sections of screens shall be secured to the permanent frame by means of riveted wrought-iron hinges and be provided with strong wrought-iron latches, bolts, or hooks.

CLASS B. VENTILATORS.

Types: By ventilators as considered in this report are meant all structures designed for the emission of air, gases or vapours from the building, separateor rooms compartments, and include louvre openings as well as ridge ventilators or tops of skylights.

20. Materials.—(*a*) To be constructed entirely of galvanised iron at least No. 24 gauge, copper at least No. 20 gauge, or of other approved fire-resistive materials.

21. Construction and Protection of Ventilators.—(*a*) If flues, either extending through roofs or sides of buildings, these should be provided either (1) with cowls or hoods projecting the same distance beyond outer edge of flue that they are raised above same, but in no instance less than 3ins. and opening should be protected with a screen of steel wire cloth, of not less than No. 16 wire or more than No. 3 ($\frac{1}{3}$in.) mesh, properly secured and completely covering the opening; or (2) edges of cowls may be carried beyond and underneath projecting or flanged edges of the flues in such a manner as to provide two turns in passage of opening; or (3) flue may be bent in such a manner as to form an inverted U.

(*b*) Louvre ventilators, or ridge ventilators, or Louvres in raised or hip skylights, shall be constructed entirely of galvanised iron of at least No. 24 gauge, as specified under section 3, class A. Slats of louvres to be of galvanised iron as specified, properly reinforced, and riveted to the frames. All such ventilating openings shall be protected with a screen of steel wire cloth, of not less than No. 16 wire or more than No. 3 ($\frac{1}{3}$in.) mesh, properly secured to the frames and completely covering the openings.

(*c*) Ventilating monitors, or similar structures, to conform in general with roof construction of buildings of which they form a part, and as specifically noted under section 4, class A. Louvre or ventilating slats to be of galvanised iron, as specified, properly reinforced and riveted to frames. All such ventilating openings to be protected by steel wire cloth,. of not less than No. 16 wire nor more than No. 3 ($\frac{1}{3}$in.) mesh, properly secured and completely covering the openings.

(*d*) Frame ventilating structures, similar to those referred to under a, b and c, section 21, class B, but constructed of other materials, shall be protected by steel wire cloth of not less than No. 16 wire or more than No. 3 ($\frac{1}{3}$in.) mesh, properly secured and completely covering the opening.

CLASS C. DOOR LANDINGS, PENT HOUSES OR BULKHEADS.

22 (*a*) On all openings of fire-resistive construction to be constructed of approved fire-resistive materials, reinforced with angle iron, properly protected by approved fire-resistive materials. Doors to be standard. Windows to be of standard wired glass, in standard metal frames.

(*b*) On buildings of slow-burning construction may be either (1) of not less than 4×4-in. framework, filled in with brick, terra cotta, cement, or other approved fire-resistive materials, tin-clad on the outside; (2) double boarded, tongued and grooved, boards at right angles to each other, tin-clad on the outside; (3) of not less than $3\frac{3}{4}$-in. tohgued and grooved, or splined plank, tin-clad on the outside. Doors to be double battened, tin-clad on the outside, with tinning returned over the edges, Windows to be of standard wired glass in standard metal frames or as noted under b and c, section 1; items 5 and 6, b, section 13; and section 18, class A.

(*c*) On all other buildings, if not in accordance with the foregoing, and of frame, to be thoroughly tin-clad on the outside. Doors to be tin-clad on the outside and windows protected as noted under b and c., section 1; items 5 and 6, b, section 13; and section 18, class A.

CLASS D. SCUTTLES.

23. Construction.—(*a*) If on buildings of fire resistive construction to be of (1) No. 12 gauge sheet iron or steel, reinforced by 2×2×$\frac{1}{4}$-in. angle iron, or (2) double battened wood, standard tin-clad on all sides, edges and in all angles, and be provided with proper chafing plates where fitting over combing.

(*b*) If on buildings of slow-burning construction to be as noted under (a), this section, or of double battened wood, tin-clad on the outside, the tinning to return over the lower edges.

(*c*) On other buildings, if not in accordance with the foregoing, and of frame, to be thoroughly tin-clad on the outside, the tinning to return over the lower edges.

24. Fastening.—All scuttles are to be fastened by means of strong steel or wrought-iron, galvanised hinges, bolted to scuttle and combing or roof.

25. Stops.—All scuttles to be provided with suitable stops, consisting preferably of a strong chain, bolted to scuttle and combing, allowing the scuttle to open slightly beyond a vertical position.

26. Ladders.—Permanent ladders should be provided, giving access to scuttles.

CLASS E. OPEN AIR OR LIGHT SHAFTS.

27. Lights.—All lights at bottom of open shafts or wells, if not of thick glass prisms set in substantial cast iron frames, shall be in accordance with sections 1, 2, 3 or 4), 13 (provided wired glass not not less than $\frac{1}{2}$in. thick and no wire cloth of less than No. 12 wire or over $\frac{3}{4}$-in. mesh be used), 14, 15 and 16, class A, and furthermore conform to the rules governing other types of skylights as noted under class A if such types of lights are used.

27. Protection of Shafts.—The tops of all open shafts shall be covered by galvanised steel wire cloth screens of not less than No. 12 wire nor over $\frac{3}{4}$-in. mesh, constructed and secured in accordance with section 15, class A.

Reinforced Concrete Strong Rooms.—The excellent fire-resisting qualities of reinforced concrete have brought about a comparatively new application of this material—namely, the construction of fire-resisting and burglar-proof strongrooms. We are informed that the Coignet system has recently been employed and is at present recommended by several well-known London architects for this purpose. The report issued by the British Fire Prevention Committee on a test of a large floor on the Coignet system has demonstrated in a very satisfactory manner what may be expected from this method of construction.

STOCKTON THEATRE FIRE

The fire at the Theatre Royal on August 28 was remarkable for the rapidity with which, having once obtained a hold, the flames gutted the entire building. The outbreak was discovered through the smoke and flames issuing from the skylights over the stage at a few minutes past 11 p.m., only six minutes after the front of the house had been locked up for the night. The captain of the fire brigade was in the theatre on the night of the fire until 10.50, and observed nothing unusual when leaving, after looking round. He had scarcely reached home, however, before a telephone call was received notifying the brigade of the outbreak. Four minutes later the first jet of water was playing on the flames, and the brigade steamers followed soon afterwards. The fire evidently originated in the "flies," and quickly spread to the front of the house between the ceiling and the roof, owing to the fact that the proscenium wall did not extend even to the top of the arched opening, leaving an open space above. There were also several openings with ordinary wooden doors in the proscenium wall on the prompt side, by which the flames gained access to the auditorium. The asbestos curtain was consequently of little value in checking the spread of the fire. Other openings on the side of the stage communicated with the annex containing dressing-rooms, bars, and entrance to gallery. Further, the interior construction was chiefly of wood! With these conditions in its favour, the fire made short work of the theatre, laughing at the efforts of the firemen, who had perforce to content themselves with the prevention of injury to the adjoining properties. The loss will reach £10,000, but the disaster was a trivial matter compared with what it would have been had the fire broken out during a performance, for the loss of life must inevitably have been very great. The theatre was built in 1866.

THE BRISTOL FIRE.

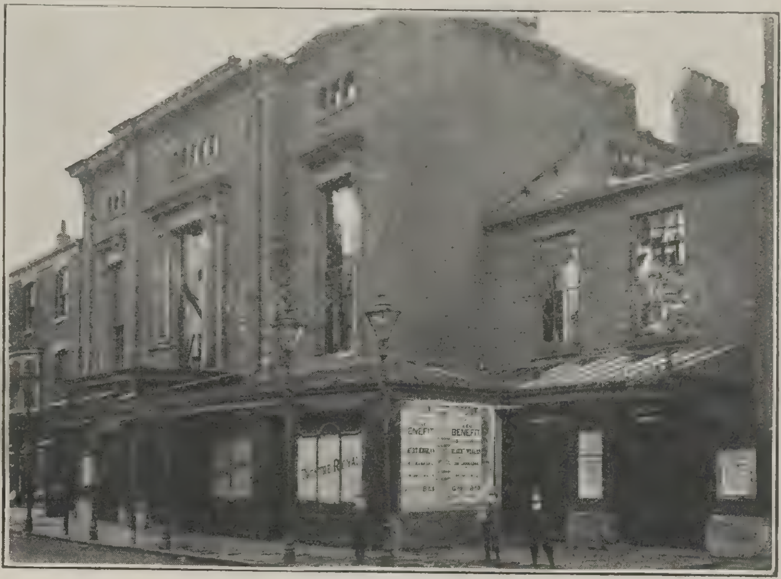
The disastrous fire at the Merchant Venturers' Technical College in Unity Street, Bristol, which occurred early on the morning of the 9th instant, has been the subject of many conflicting reports in the daily press.

The fire broke out in the top storey and soon spread to the second floor, and within ten minutes the whole structure was in flames from end to end. The top portion of the building was used as a laboratory, and it is conjectured that the outbreak was probably due to the combustion of chemicals. The college was originally erected about 22 years ago by the Society of Merchant Venturers at an outlay of some £50,000, which is covered by insurance. Mr. E. C. Robins was the architect of the building.

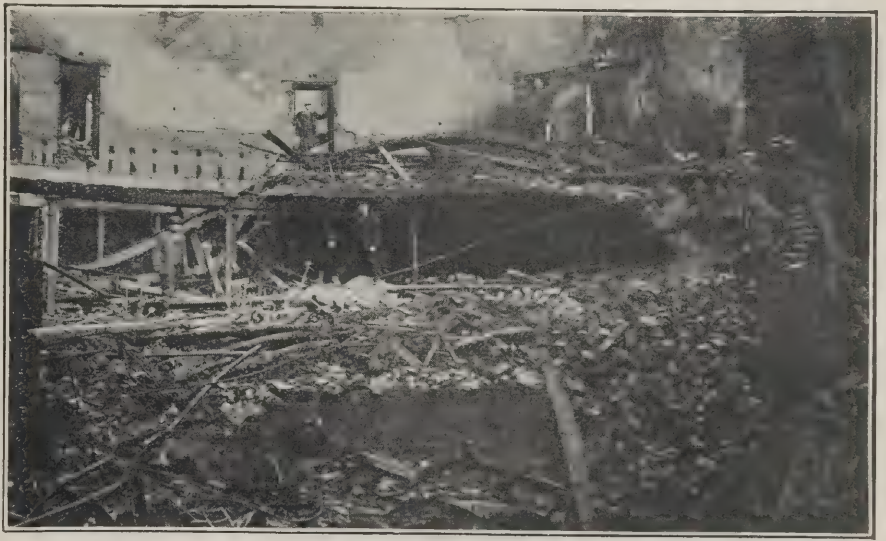
The construction of the building has been variously described; some accounts stating that "*the main portion of the structure was of pitch pine,*" while others referred to the building being constructed on "*the fireproof principle,*" and failure of fireproof floors were (in the local press) described as having occurred in certain portions of the building where the floors were entirely of wood construction.

A careful examination of the building having now been made, and the state of the structure compared with the actual working drawings of the floors, etc., we are able to state definitely that the use of fire-resisting construction was confined mainly to the ground and first-floor levels, but even at the the first-floor level the fire-resisting separation was not complete, as the class rooms between the great hall and Unity Street had ordinary wood joists and boarded floors.

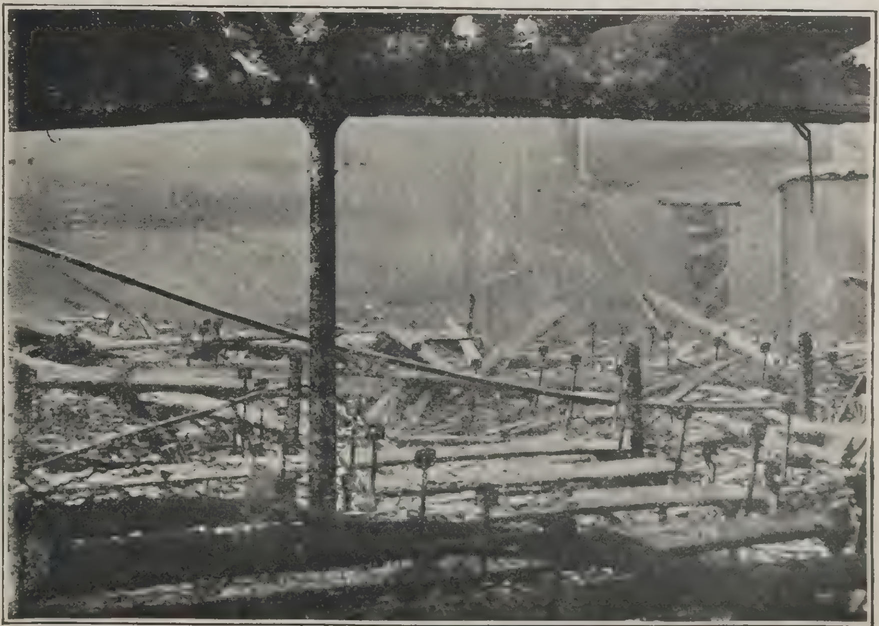
Above the first-floor the construction of the floors was mainly as follows:—



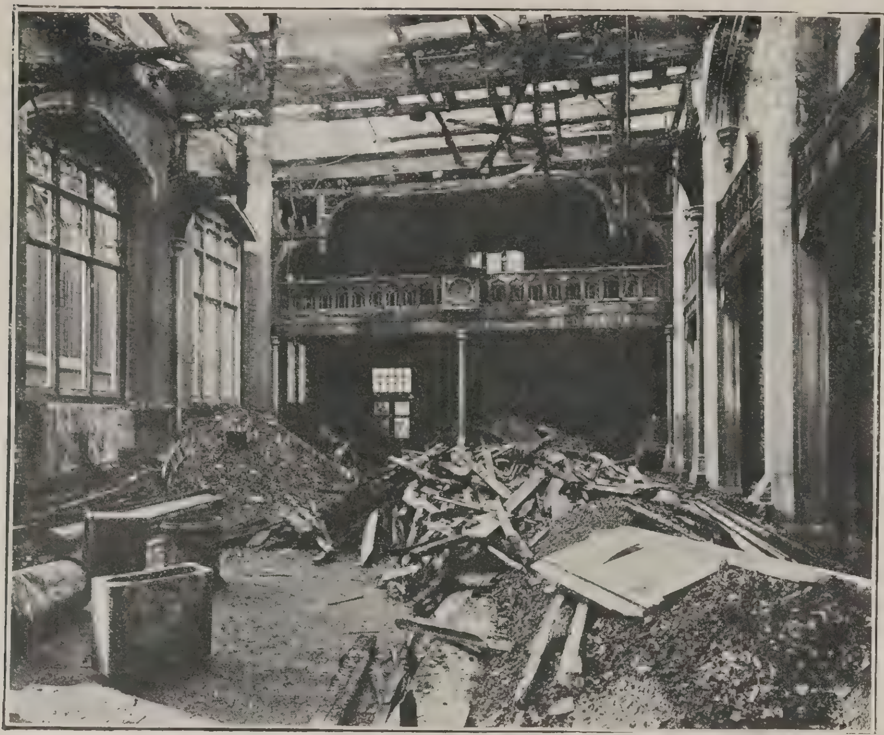
THEATRE ROYAL, STOCKTON-ON-TEES.



VIEW LOOKING FROM STAGE.



THEATRE ROYAL, STOCKTON-ON-TEES: VIEW LOOKING TOWARDS STAGE.



GREAT HALL, SHOWING DEBRIS ON CONCRETE FLOOR.
The Floor remaining over the end gallery is of concrete; the rest was wood.

Iron girders spanning from wall to wall, and spaced from 12 ft. to 14 ft. apart, supporting wood binders, and upon the top of these rested the ordinary wood floor joists with ceiling fillets beneath.

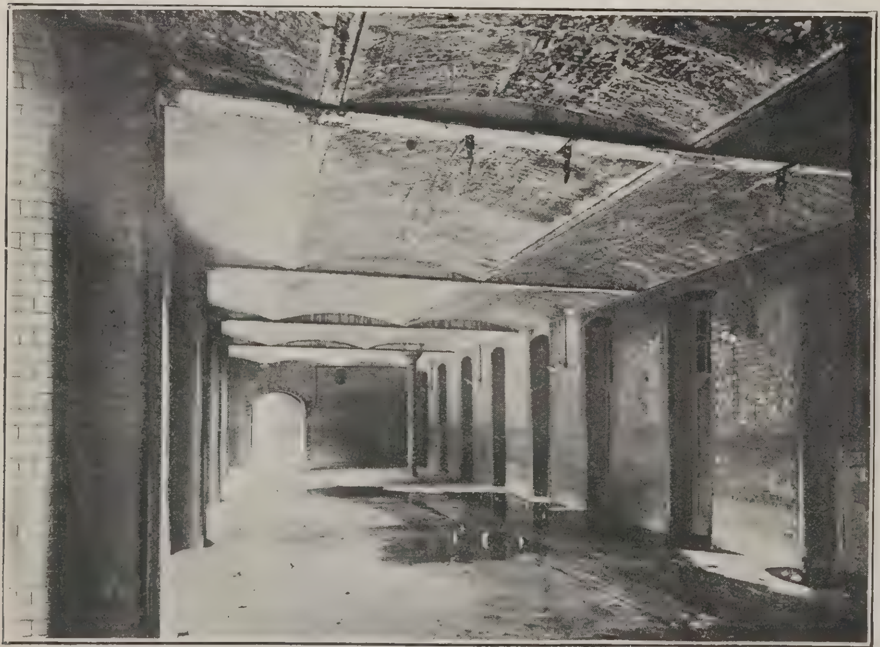
The whole of these wood-constructed upper floors are entirely burnt out, and the wooden portion of the first floor above referred to next Unity Street, although not entirely destroyed, has suffered considerably from the fire and falling debris—and there are several large holes in it where the falling materials have dropped through to the ground floor.

Fire-resisting construction was used on the upper floors to a very limited extent, and mainly to landings and one or two rooms which were probably intended to be used for some special purpose. Wherever fire-resisting floors existed they remain intact, and no failure of concrete floors has occurred in any part of the building.

It was only at the first-floor level that concrete floors were adopted to a sufficient extent to form a fire-resisting separation, and here they have served their purpose—the fire not having extended below the fire-resisting portion of this floor at any point.

The interior of the great hall presents many interesting features. The hall is bare, and open to the sky, but iron girders with charred fragments of wooden floor joists hanging to them still span from wall to wall.

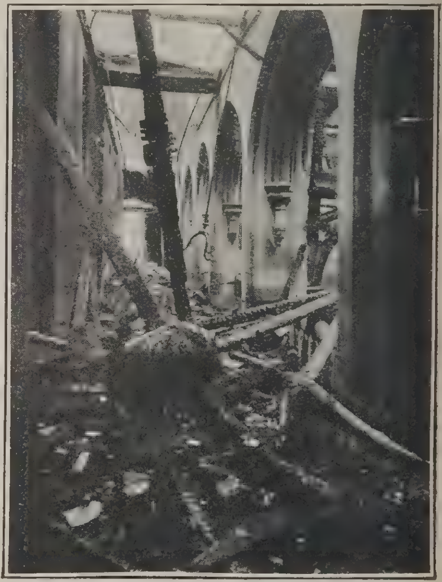
The only portion of fire-resisting floor over this hall is immediately above the end gallery, and this remains rigidly in its place (as shown in our view), although piled up with wreckage from the falling woodwork and covering of the roof. Portions of the panelled ceiling remain almost intact where constructed below this concrete work, and serve to show the elaborate nature of that which is gone. Even the wooden gallery received so much protection from the concrete floor above that it is not greatly damaged.



ARCHED CONCRETE FLOOR BELOW GREAT HALL.
The Iron Column shown is the lower part of the one under gallery clock in view above.

The concrete floor of the side gallery is also intact, and supports a large quantity of debris (see view). This floor (as well as other portions of the concrete construction) was subjected to very severe test; the fire attacking it from below, as well as from above; and it had also to sustain heavy strains of impact from falling beams, etc., of the wooden floors and roof work.

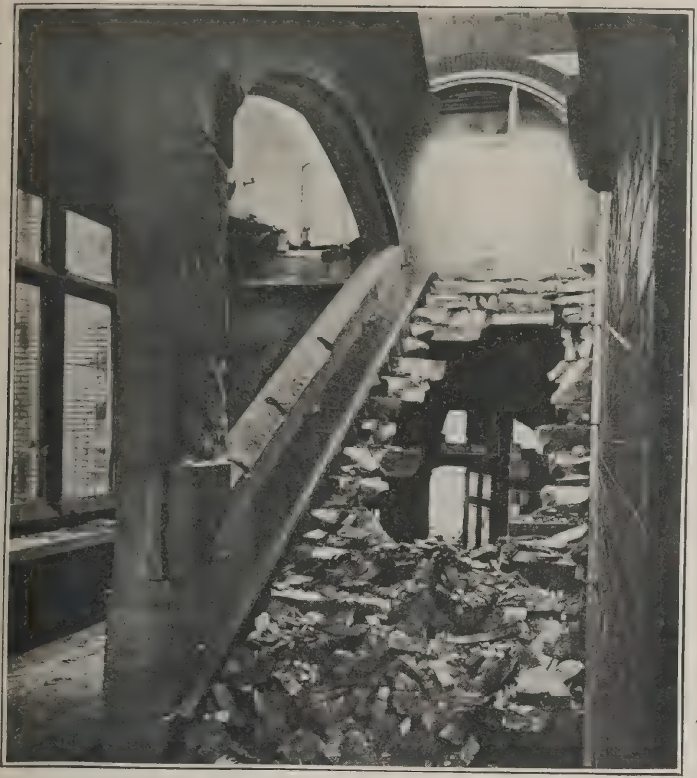
The fire-resisting floor of the hall is piled deep with wreckage, but the floor itself stands firm. Passing down the stairs, and walking under the floor of the hall a remarkable contrast to the scene above is noticed. The ceiling overhead (the floor of the great hall) which was executed some 24 years ago by Messrs. Dennett and Ingle, on the arched form of concrete work peculiar to their method of constructing fire-resisting floors for large spans, is quite perfect, and appears to have suffered no damage from the impact of falling debris.



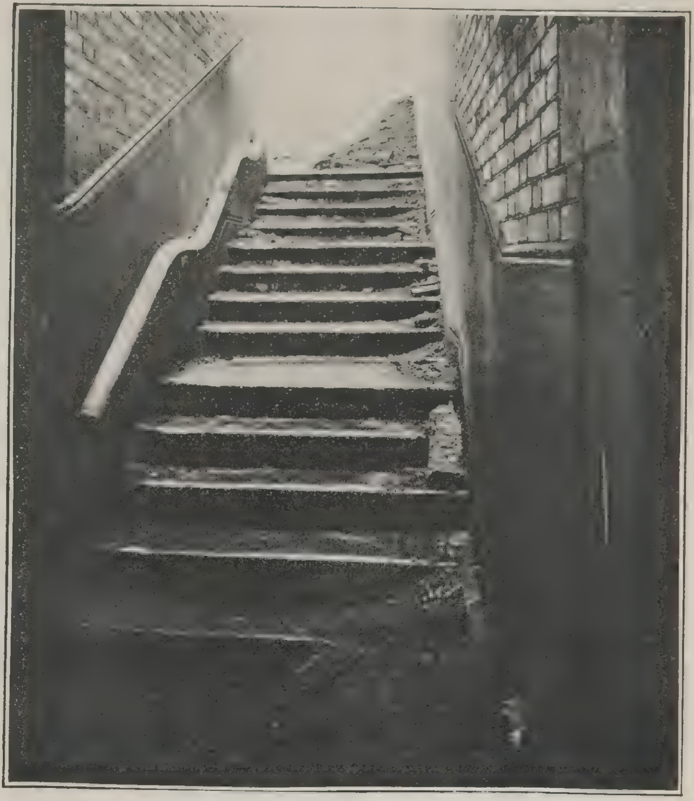
SIDE GALLERY OF GREAT HALL,
SHOWING DEBRIS ON CONCRETE FLOOR.

Further examination of the upper floors demonstrates in a forcible manner the superiority of concrete over stone for stairs and landings. At the Denmark Street end of the great hall a large flight of stone stairs is practically destroyed above the first floor, and was perhaps not badly described in a fire official's report as having "exploded." As a contrast to this, a main flight of stairs at the opposite end of the building constructed in concrete, and with stone finishings to treads and risers remains intact from top to bottom. We give views of these two stairs.

Generally, the partially-wrecked building presents a valuable object lesson. Constructed, as it was, partly of combustible, and partly of fire-resisting materials, it affords an excellent testimonial to the latter method of construction, and emphasizes the importance of not half-heartedly adopting it.



The Destroyed Marble Staircase.



The Concrete Staircase which Remained Intact.

THE FIRE AT THE MERCHANT VENTURERS' TECHNICAL COLLEGE, BRISTOL.

FIRE TESTS.

A Reinforced Concrete Floor.

We have from time to time recorded fire tests conducted by the British Fire Prevention Committee on floors of reinforced concrete, and we understand this series is being continued and remains the only series of such tests with floors of large area so far undertaken in any part of the world; the United States' tests generally being with floor sections of smaller area.

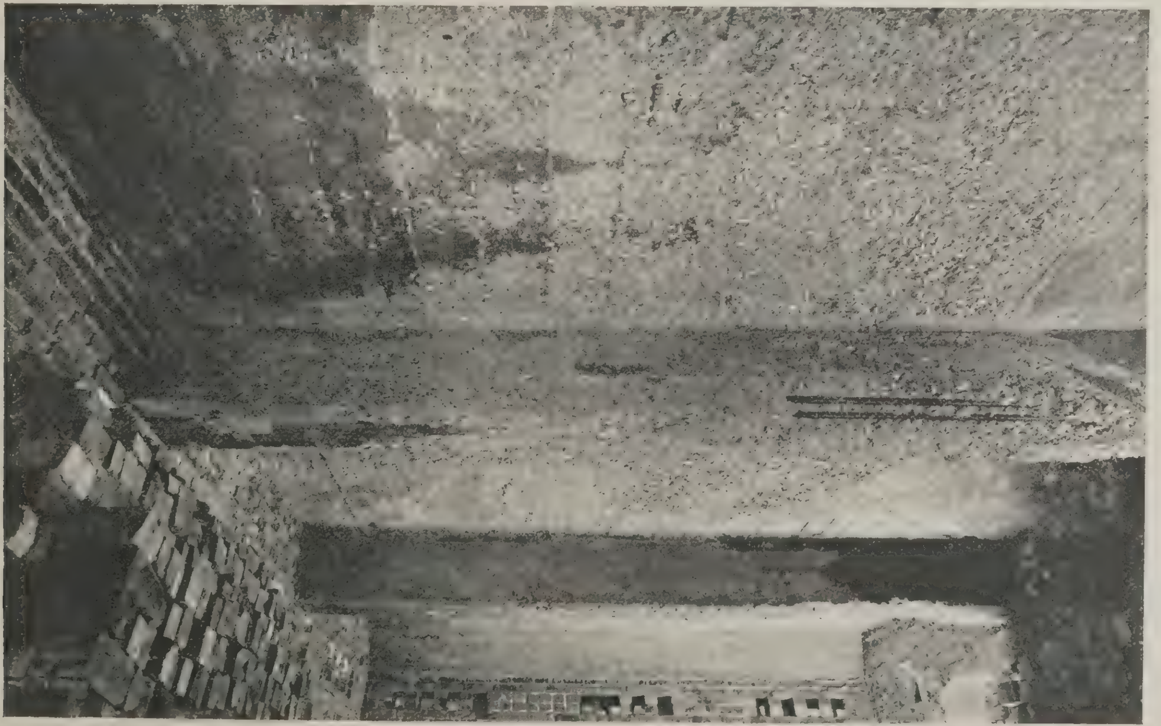
We can do no better in this case of a floor constructed by the Patent Indented Bar Co., Ltd., than to simply present the object and the summary of the test, and to note how the highest classification —namely, that of the fully protective class B—was obtained with a very small deflection of three-quarters of an inch on the beams. We also give Mr. Marsland's preliminary note.

The most important point raised is that contractors cannot be too careful in seeing that their metal work is properly protected, for even in this test case, where the protection of certain rods was intended to measure one inch, the rods had apparently been trodden down during building operations, so that they were just below the soffit. It is one of the great dangers of reinforced concrete intended to be fire-resisting that such rods are liable to be trodden down during the time that the work is being executed, and for that reason alone it is desirable to specify the position of the rods, so that there may be a margin for such deflections or bendings that may take place during construction.

Mr. Marsland's Note.

The test reported does not add materially to the knowledge obtained from former tests of a similar character.

It, however, emphasises the lessons taught by former experience, viz., that



FIRE TEST ON A REINFORCED CONCRETE FLOOR CONSTRUCTED WITH INDENTED STEEL BARS.
GENERAL VIEW FROM BELOW, LOOKING NORTH (AFTER TEST).

however carefully the rods are fixed they get to some extent displaced while the concrete is being filled in.

Some of the rods to the bays were found to be just under the soffit of the concrete, whereas they were supposed to be one inch from it. The result was that the bays deflected in addition to the beams in consequence of the weakening of the bars by reason of their becoming heated.

The occasion of this report is taken to remark that, for floors tested in the future, it might be advisable to uniformly limit the area of the cross section of the beams employed in proportion to the span and load. Attention should in future be called to the factor of safety calculated.

Object of Test.

To record the effect of a fire of four hours' duration, the temperatures to reach 1,800 deg. Fahr. (982.2 deg. C.), but not to exceed 2,200 deg. Fahr. (1,204.4 deg. C.), followed by the application of water for five minutes, with a view to classification under "Full Protection" (Class B).

Note.—The area of the floor under investigation was to be at least 200ft. super. (18.58 sq. metres). The floor was to be loaded with 280lb. per sq. ft. (1,367 kilos. per sq. metre) distributed.

The area of the floor in this case was 410ft super. (38 sq. metres), divided into three equal reinforced concrete bays, supported by two reinforced concrete beams, the beams had a span of 15ft. (4.57 metres), the bays measured 15ft. by 7ft. 5in. (4.57 metres by 2.26 metres), centre to centre, the flor was 6in. (0.152 metre) thick, and the depth of the beams below the floor was 17in. (.43 metres). The load was 280 lb. per sq. ft. (1,367 kilos. per sq. metre). The water was applied for five minutes.

The time allowed for drying was 39 days (summer).

The centering was struck after 14 days.

Summary of Effect.

At the expiration of 15 minutes, the floor began to deflect, and continued to do so till the end of the test, when a maximum deflection of .90in. (.0229 metres) was registered.

On the application of water the concrete to the soffit of the beams, where struck by the jet, was knocked off, exposing the rods in the lower part of the beams. The soffit of the floor was also eroded where struck by the jet.

On the load being removed, the surface of the floor showed various cracks. The permanent set of the floor over the beams was average ¾in. (.019 metres) and the permanent set of bays between beams was average ¾in. (.019 metre).

Neither fire, smoke or water passed through the floor.

Classification, fully protective (Class B), was obtained.

Correspondence.

Fireproofing Scenery.

To the Editor of The Builder's Journal.

Sir,—The address by Mr. Freeman before the American Society of Mechanical Engineers, which you published in your "Fire Supplement" for September 26th is an exhaustive account of certain means for safeguarding theatres from fire; but with due deference to Mr. Freeman I venture to say that a far more economical and reliable method than any he suggests is to render all the materials used for and on the stage flame-proof by chemical impregnation. If this is carried out properly there need not be the slightest fear even of a small fire occurring, whilst at the same time it renders any other safeguard against fire unnecessary.

Upon this matter Mr. Freeman says: "After having investigated the question of fire-proofing the scenery, I am led to believe that we must after all rely on the safeguards of the engineer rather than those of the chemist. The efficient fireproofing of the great quantity of white pine (8,000 sq. ft.) appears to be a practical impossibility."

It is this statement that I am more particularly concerned with, and why in the name of all that is veracious Mr. Freeman should make such a statement, when the briefest enquiry on his part would have shown him that hundreds of thousands of people in London know from personal experience the exact contrary to be the fact, for the entire woodwork of all the cars of the District Railway (Yerkes' system) has been rendered flameproof by chemical impregnation. Every door, all the flooring, every seat, all the panels, window-frames—in fact, the whole of the woodwork, amounting to about 500 cubic feet in each car, or a total for the 500 cars of about three million sq. ft., consisting of ash, mahogany, Oregon pine maple and whitewood—have all been rendered flame-proof by chemical impregnation. These cars, some of which have been running for upwards of two years, are an existing proof of the fact that wood can be rendered thoroughly flame-proof by impregnation, and more than once they have been saved from destruction by fire, because the wood was flame-proof.

How many millions of feet of flameproof wood are in use in America statistics do not show, but from the fact that within the past few years no high buildings have been erected in some of the States unless the woodwork had been rendered flame-proof there can be hardly any doubt that there are millions upon millions of feet of treated wood in practical use in that country. In France also the use of chemically-treated wood is becoming very extensive.

With reference to theatres, Mr. Freeman has only to consult the regulations of the London County Council, and those of Bradford, Bath, Bristol, Birmingham, Edinburgh, Glasgow, Newcastle, Sheffield, &c., to find that all scenery must be rendered and maintained uninflammable; and whilst this wise provision for safeguarding life and property is not as yet universally followed by the theatres, many of the leading ones are spirited enough to comply with the law, and the consequence is their scenery is uninflammable.—Yours faithfully,

A. W. Baxter, A.M.I.N.A.

Differences about Rights of Light. It is a deplorable fact that some thousands of pounds in legal costs have been incurred in connection with the interference of light to a sitting-room not 14ft. square in a small suburban house at Ealing. This is the case of *Kine v. Jolly*. Rights of light and air have been the subjects of innumerable disputes and law cases, and there is no indication that matters will be any better in the future. The evil has a two-fold aspect. In the first place, it seems quite unsatisfactory that there should be any such things as "ancient lights," bearing in view what power these put into the hands of the owner to exercise for his own benefit, irrespective of the needs of his neighbours. The law was formerly understood to mean that one had a right of action if it could be proved that the light had been diminished, but the celebrated case of *Colls v. Home and Colonial Stores* quite upset that idea, establishing in place that there could be no case for damages or an injunction unless the obstruction amounted to a nuisance, and so long as there was enough light for the ordinary purposes of habitancy or business. This reading of the law is juster and better than the old one, but it has put the matter very much in the hands of witnesses, for each case has to be proved by specific evidence as to whether or not there remains the sufficiency of light on which everything depends. In the particular action about the suburban house at Ealing mentioned above, it is worth noting how opinion has differed even among the judges, for when the case was brought to the Court of Appeal from the King's Bench Division Lord Justice Romer dissented from the finding of his two colleagues, and when the case came finally before the House of Lords last Thursday two out of the four judges were unable to agree with the finding of the other two, and so the case stands at the judgment of the Court of Appeal. We have no intention now of reciting the details of the case, which will be found reported in our issue for December 21st, 1904, when the action was heard in the Court of Appeal, but we would take this opportunity to point out how unsatisfactory this law of rights of light still is; and especially would we emphasise how involved the judgments are. Mr. Justice Kekewich, for instance, said that the erection of the adjoining house had altered the character of the room, "and that, though still a well-lighted room, it has lost in the obstruction of light one of its chief charms and advantages"—which draws the delicate distinction between an "exceptionally well-lighted" room and a "well-lighted" room: a point for lawyers, but not for reasonable beings.

Opportunities Abroad. It has often surprised us that, with the depression in the architectural profession in this country, clever young men have not more often looked abroad for openings. They seem to limit their range of outlook to our Colonies, but it is evident from the fact that the public in the United States call upon American architects to provide houses purporting to be designed "in the English style" that there is an opening there for English draughtsmen, if not for English architects in practice for themselves. The efforts which American architects make to meet this demand, as one may see by American publications, cannot be called successful. It is true that a few architects who have specialised in domestic architecture have succeded in producing a very fair suggestion of English work, but the large majority of the attempts made are a distressing combination of half-timber applied to the Colonial style. If we in this country do not excel in the design of public buildings, we have at any rate a pre-eminent reputation for good domestic work and church architecture. This being so, and with the feeble efforts before us of American architects trying to supply the demands for houses in "the English style," it certainly seems to us that capable young men now bemoaning their fate here should be able to find employment in the offices of American architects. It is, perhaps, doubtful if they would at first be welcomed practising on their own account, because the ordinary American citizen is rather antagonistic to the Britisher, though the German, the Austrian and the Pole are welcomed with open arms. The opportunities of employment are not confined solely to domestic work either, because church work is just as badly done by American architects, who seem to perpetuate the miserable work done at the tag-end of the Gothic Revival. Just now, we notice, Mr. Bodley is engaged with the design of the huge cathedral proposed to be erected at Washington, and we remember, also, that the late J. F. Bentley was asked to submit a design for the New York Roman Catholic cathedral. These are the opportunities of the great, of course, but for capable men in a humbler sphere there should be openings; and although the possibilities are greatest in America, there would seem to be chances, too, in Germany, Austria and France. Inspection of the publications of these three countries shows that there are very few perspective draughtsmen of ability there. The German draughtsman inclines to the grotesque and the crude, the Austrian is very little better, while the French draughtsman is too mechanical and unimaginative. As for French domestic work, it can hardly be said to exist. The houses are more or less copies of town halls and châteaux, and they are devoid of homelike feeling. So far as Germany and Austria are concerned, the appreciation of English domestic architecture is pronounced, as proved by the close attention which German architects pay to the English architectural and art publications, though they apply the information without real understanding. If the Germans copy our "art and craft" furniture, decoration, and domestic work, there ought surely to be an opening for the English designer to apply his profession first hand; and the enthusiasm with which a few of our leading English designers have been received—Mr. Walter Crane and Mr. Gordon Craig, for example—would suggest that the architect might stand a greater chance of receiving a welcome on the Continent than in the United States.

ALL SAINTS' CHURCH, TOOTING GRAVENEY. TEMPLE MOORE, ARCHITECT.

ALL SAINTS' CHURCH, TOOTING GRAVENEY.

The new church of All Saints, at Tooting Graveney, shown by the accompanying illustrations, will well repay a visit. It is not far from the Tooting terminus of the L.C.C. electric trams. For external effect it depends upon outline, appropriate and simple fenestration, and an austerity which is one of the principal charms of old work. The plan includes nave and choir of seven bays, with a Lady Chapel beyond. The length of the nave and choir is 130ft., and the height to the crown of the wooden groined ceiling is 55ft. The nave arcade is flanked on either side by double aisles, divided by slender columns of grey Forest of Dean and Quarella stone, moulded with much refinement. The nave aisles are roofed with a wooden ceiling, which gives opportunities for suitable enrichment. The tower makes a fifth bay to the left aisle and an organ transept and ample vestries connect the right-hand aisle of the choir with the vicarage. The choir aisles make a fine external feature and give an airy sense of space to the interior of the choir. The internal appearance of the three arches behind the High Altar, through which one catches a glimpse of the Lady Chapel, is very happy. Above are three windows which light up the groining internally and add much to the exterior effect of the choir. The wooden groining of the nave roof is quadripartite; the architect's construction has made it quite clear that the groining is wood, not stone. The ribs are closed at the apex by richly-carved bosses. A bold effect is obtained throughout the building by taking advantage of the ample dimensions of the walls to provide dignified window splays. At the narthex end of the church these splays are 3ft. 6ins. wide, the wall itself being 4ft. 3ins. The Gothic fittings designed by Mr. Temple Moore for the choir and sanctuary have not been carried out. In their place Italian stalls, veneered with walnut and provided with canopies, have been fixed. The church alone, exclusive of fittings, has cost £23,000. Messrs. S. Sherwin and Son, of Boston, were the builders.

ALL SAINTS' CHURCH, TOOTING GRAVENEY. TEMPLE MOORE, ARCHITECT.

R.I.B.A. EXAMINATIONS.

Model Answers by A. G. Bond, B.A., A.R.I.B.A.

The Final Examination.

(*Continued from page* 191, *No.* 610.)

Subject V.—Specifications, Estimating and Professional Practice.

[*Time of examination, three hours. Maximum number of marks, 75.*]

1. *Write a specification for all trades for an asphalted flat roof over a hall 25ft. square to a public building, and provided with an octagonal dome, 15ft. diameter, glazed on all sides and finished inside with plaster enrichments.*

Note.—In a question of this sort it is always necessary first of all to make a rough sketch of the scheme proposed as a definite basis upon which to write the specification. The basis adopted will of course vary, and consequently the various specifications may be very different, both in the number of trades and length, but the answer should be comprehensive; the course adopted in the following answer will be found a wise one to follow:—First of all the sketches are made, then the various trades included are written down, then a list of the clauses under each, and lastly the clauses themselves are written out at length. If the candidate, following this method, finds he has only time to write a few specimen clauses in full his work will, nevertheless, show he has a thorough knowledge of the subject.

Trades included.	Clauses in each trade.
Concretor	Concrete in flat (aggregate, matrix, reinforcing, asphalt, mixing, &c.)
Carpenter	Centering, bracketing and cradling.
Founder and Smith	R.s.j.'s, glazing bars, &c., of dome light, r.w. gutters and pipes.
Plasterer...	Materials, floats to concrete soffit, cornices, fibrous plaster. Make good.
Plumber...	Wire covers, pipes to cesspools, ridge-piece.
Glazier	Wired glass, inner dome with lead lights.
Painter	Painting on iron, distemper touch-up

Specimen Clauses.

(For the remaining clauses the reader is referred to the latest issue of "Specification.")

Concretor.—The concrete for flat to be composed of two parts coke breeze, 2 parts broken brick, and 1 part Portland cement (all as before specified), to be measured with proper measures, thoroughly mixed dry on a wooden platform, and water then added through a rose-head; the concrete shall then be turned over and thoroughly mixed and immediately deposited. A layer of expanded steel as before specified shall be laid direct upon the centering and round the r.s.j.'s, and the concrete shall be well worked into this so that it is entirely en-

Concrete in flat.

cased—the finished thickness of the concrete shall not exceed 6¼ins., nor be less than 6ins., and all r.s.j.'s shall be encased with a protection at least 2ins. thick of concrete beyond surface of web or flange.

Plasterer.—All cornices to be run clean and accurately to design. Run moulded

Cornice.

plaster cornice 18-in. girth to walls and main girders and the upper members, 12-in. girth to subsidiary girders, with all mitres, returned and stopped and mitred ends, &c., truly worked as required.

Painter.—All exposed ironwork is to be properly freed from rust, scale, etc., and

Painting to Ironwork

painted two coats red lead paint before fixing. The external work is to be painted two coats, but only to approved colour, and internal work one coat white and one finishing coat aluminium paint after fixing.

2. *Write out fully the "general clauses" in a specification governing bricklayers', masons', carpenters', and joiners' work.*

Note.—There is room for great divergence of opinion as to the scope of this question, and an endeavour has been made to take a medium course.

Bricklayers' General Clauses.

1. All bricks to be the best of their respective kinds, hard, square, sound, well burnt, non-absorbent, and even in size.

2. All bricks to be well wetted before laying, except during frost.

3. No portion of the work shall be carried up more than a scaffold height above another part without the architect's written permission.

4. All brickwork shall be protected against frost, and any work injured thereby shall be reinstated.

5. Walls shall be well bonded both laterally and transversely with the fewest straight joints possible; unless otherwise directed the facings are to be in Flemish bond, and the rest of the brickwork in Old English bond.

6. The height of four courses of bricks laid in mortar is not to exceed by more than one inch the height of the same bricks laid dry.

7. Build in, or cut, bed and pin in, all sills, thresholds, steps and landings, templates and corbels and ends of posts, &c., in cement.

8. Build in frames and point in lime and hair mortar.

9. Cut away for and make good after all other trades as required.

Masons' General Clauses.

1. The whole of the stone to be of the best description of its respective kind and to be free from sandholes, vents, flaws and all other defects, laid on its natural bed unless specially directed otherwise, in fine mortar, cleaned down at completion and left perfect.

2. Any stone injured during progress of the work or found to be broken or defective at its completion is to be cut out and replaced by the contractor.

3. Every stone to hold its full length and height square to the back.

4. Supply all necessary lewising and drilling for anchors by the stonecutter and hoisting and fitting at the building.

5. All stones to be well wetted before setting, except during frost.

6. No angle mitres are to be used.

7. Clean down the masonry work and generally leave the whole perfect and complete, omitting no material or workmanship described or implied by the drawings or this specification, or that is necessary to render the whole complete in every respect.

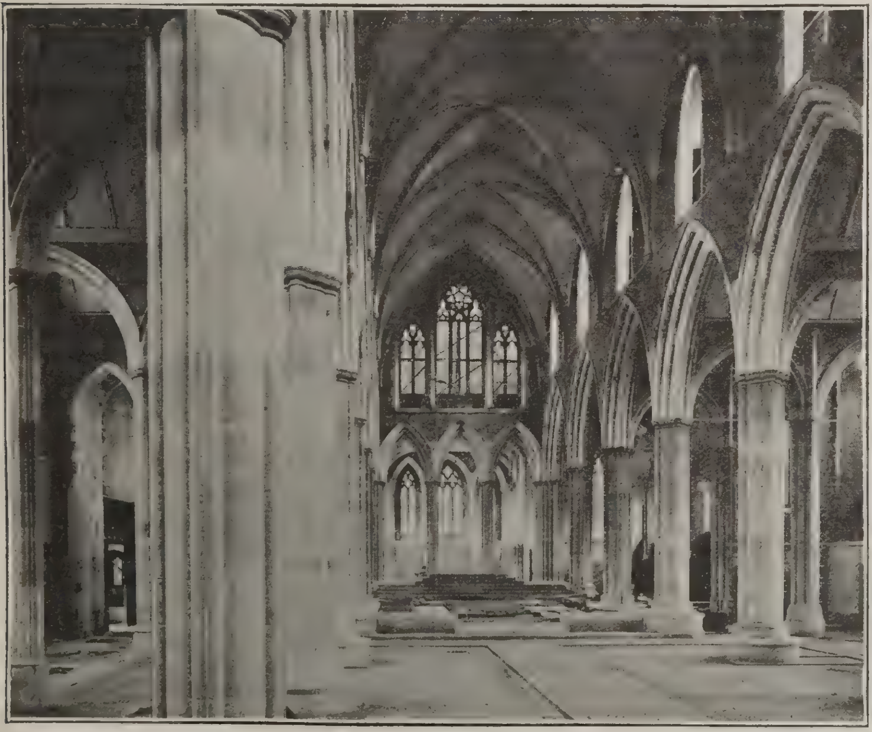
Carpenters' General Clauses.

1. The whole of the timber to be sound, well seasoned, free from sap, large, loose or dead knots, waney edges and other defects, and to be sawn die square.

2. Timbers of large scantlings to be sawn immediately upon the signing of the contract.

3. Cut away for, attend upon and make good after all other trades.

4. The whole of the work is to be framed, trussed in the best possible manner and fitted with all necessary bolts, straps, &c., required.



ALL SAINTS' CHURCH, TOOTING GRAVENEY. TEMPLE MOORE, ARCHITECT.

Joiners' General Clauses.

1. All timbers, deals, &c., used for joinery must be thoroughly well seasoned.

2. All joinery is to accurately set out in accordance with the detail drawings and finished off in a workmanlike manner.

3. The dimensions and thicknesses figured on the drawings or described in this specification to be the finished sizes when fixed in the building.

4. All joinery to be cut out and framed together immediately after the commencement of the building, but not wedged up until just before fixing.

5. Any joinery found to warp, shrink or develop shakes or other defects is to have the defective parts replaced with new before wedging up.

6. All glue joints to be cross-tongued.

7. All joinery to be fixed to elm pads or, where directed, to framed grounds, backings and other fixings in the most workmanlike manner, and attend upon and cut away for and make good after all trades as required, and leave all joinery perfect at completion; any shrinkage or other defects showing within six months from the date of completion will have to be replaced or made good at the architect's discretion at the contractor's expense.

3. *State approximately the cost per cubic foot of a high-class residential building executed in:—*

(a) Brickwork with best quality red facings.

(b) Portland or other hard stone facings.

Also give the price per cubic foot of Portland or other hard stone worked as ashlar.

Estimating the cost of a building by "cubing" is such a very approximate method that the difference between the facings would hardly have so much effect upon its accuracy as the relation of voids to solids or the quality of the internal finishings, &c.; again, the comparative price would vary with the locality; perhaps in London one might allow 1s. per foot cubic for the red brick faced building, and 1s. 3d. for the Portland stone one, but it would generally be best in such a case to take off roughly the superficial area of the facing and ascertain the total difference in cost by finding the comparative price per foot super. thus: the Portland stone ashlaring could be taken at about 2s. per foot super. extra only on common brickwork, while the best red facings can be taken at 9d. per ft. super.—that is to say, an extra of about 1s. 3d. per foot super. of facing would be entailed by using Portland stone.

The current price per foot cube of Portland stone (White Basebed) delivered on road waggons at the London depôt is 2s. 2½d. The price for the stone worked as ashlar depends, of course, upon the superficial area of the worked face, and therefore varies with the thickness of the bed face; it is therefore generally priced at per foot super. and varies from 2s. 6d. per foot super. for 4-in. bed face with plain joints, to 4s. per foot super. for 5-in. bed face, with rubbed facing, and including bonding stones.

4. *If you are acting for a client in rebuilding his premises, what are the points affecting him with regard to his neighbour's rights, and what precautions would you take to safeguard your client in the event of litigation?*

The points affecting the client in connection with his neighbours can be divided into three divisions—viz., (a) those easements acquired naturally or by grant; (b) those regulated by Act of Parliament; (c) those regulated by the title deeds or lease. The most often occurring are (1) light and air; (2) public or private rights of way; (3) rights of adjoining owner as to footings, support, party walls, eaves, &c.; (4) lines of frontages, vaults, &c.

Of these (1) is by far of the most frequent occurrence, and in almost all cases (at any rate in town property) it is wise to make careful record drawings of the existing premises; these may be supplemented by photographs and models, and should be verified, checked and signed by a second surveyor; it is often done by the district surveyor. Where practicable, retain the client's old lights in exactly their former positions and avoid all undue interference with the ancient lights of any neighbouring property.

(2) Public rights of way must be respected. See London Building Act, section 71, for construction of arches, &c., over same.

Private rights of way may have been acquired by express or implied grant or by prescription—*i.e.*, uninterrupted use for 20 years, and must be respected unless extinguished by express release or abandonment for 20 years.

(3) Footings.—The rights of the building owner in respect to these vary in different localities. In London he has the right to cut away any footing or other projections from any party or external walls in order to erect an external wall against such structure, upon condition of making good any damage caused by the operation.

Support.—In absence of a binding engagement to the contrary, every man having land adjoining that of another has a right to require the other to continue the support afforded by the soil of his land to the soil and also to any ancient (20 years) structure built thereon, and even in the case of a more recent building must use due care to avoid damage.

Party Walls.—The rights in regard to these are set out in the London Building Act, sections 87—101. The prescribed notices must be served before they are interfered with.

Eaves.—Rights of eaves and of rainwater or other pipes, &c., must be respected if "ancient."

(4) Lines of Frontage.—If an old building is taken down to the extent of more than a half of its cubical extent the Council may require it to be set back to such general building line and in such a manner as the Council shall direct, but shall compensate the owner for any damage or expenses which he may sustain or incur thereby. Such general building line to be laid down by the superintending architect; it can be brought before the Tribunal of Appeal by objector thereto.

Buildings may, under special circumstances, be brought beyond this line if the forecourt be dedicated to the use of the public, or upon any other condition agreed between the building owner and the Council.

Sometimes the line of building frontage may be governed by the conditions upon which the land was originally bought or the estate laid out for building.

Certain projections are allowed for pavement lights, bays, cornices, &c.

Vaults, &c.—Not to extend under the public way more than the width of pavement or 10ft., whichever be the lesser.

Area gratings or pavement lights not to project more than 1ft. upon the public way.

5. Certain work is being executed in a building over and above that included in the contract. How would you exercise a control over it in the matter of the final settlement of accounts?

The architect should make a practice of giving a written order on a special form for every variation before its execution and allowing none to be made without such order; this saves a great deal of trouble and dispute at the final settling up; if the "extra" is such that its value cannot readily be ascertained from the priced bill of quantities or schedule, it is safer to obtain an estimate from the contractor before the order is given and to specify the amount agreed upon the order. Of course, in many cases the valuing of the variations is left entirely in the hands of the surveyor, and his decision is held to be final, but in all other cases the course suggested above is the most satisfactory.

(To be continued.)

[*Answers to the questions set in the Intermediate Examination were given in our issues for July 11th, July 25th and August 8th last, and to Subjects I., II., III. and IV. of the Final Examination in the issues for September 5th, September 26th and October 17th.*]

Correspondence.

Cutting Moulds for Flat Arch.

To the Editor of The Builders' Journal.

Sir,—Referring to the answer given to the enquiry on the above in your issue of the 10th inst., allow me to draw the attention of "G. R. B." and "Mason, Sunderland," to an error in the projection of the joint moulds. These moulds cannot be projected from the developments as shown in Fig. 4. Their lengths must be equal to that of the radiating joints to which they refer: thus, the total height of the joint mould No. 2, Fig. 4, should be equal to the length of the line *f.g.* Fig. 3, and not equal to the vertical height of the stone. The long edges of the joint moulds would be slightly curved, more or less, depending on the inclination of the radiating joints, and the vertical height of check on the joint mould would be greater than its vertical height taken at the centre line of arch. Should the radiating joints happen to be inclined at a lower angle than that shown, then these inaccuracies would become more apparent.—Yours truly,

Glasgow. J. S. B.

To the Editor of The Builders' Journal.

Sir,—In answer to the above, may I thank "J. S. B." for pointing out the slip in my description. The joint moulds are projected from the elevation shown in dotted lines; and not from the development, as stated. They are projected on to a line parallel to the joint m′. l′. in elevation, and then swung round to the vertical line from o. (see angle between elevation and Fig 4): thus obtaining the same result as projecting directly from f′. g′. Joint moulds on e′. h′. have not been shown.

"J. S. B." is not quite correct in stating that the total height of the joint mould No. 2, Fig. 4, should be equal to the line *f.g.*, Fig. 3. It is equal to the length of the line f′. g′. in elevation (This, of course, is only approximate, as the joints are helical.) The long edges of the joint moulds are curved, and this I pointed out in my description (see Note 2). In the example shown it is sufficiently near to work to a straight line. The top of the check out, all along the arch, is a level plane; but, as the bed joints are inclined at different angles to the horizontal, the distance of the top of the check measured on the joint mould from some second level plane (*i.e.*, that containing the soffit of the keystone) is different for each joint. This is, perhaps, what "J. S. B." means when he says "the vertical height of the check on the joint mould would be greater than its vertical height taken at the centre line of arch"—a statement which is obviously incorrect.—Yours truly,

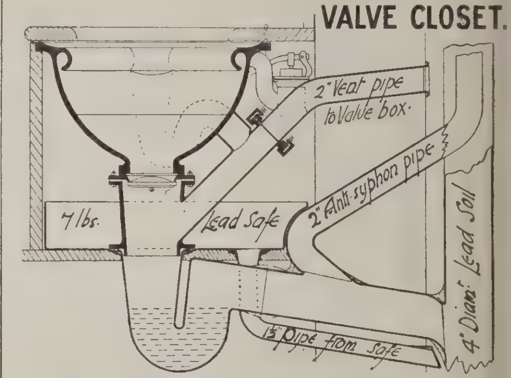
London. G. R. B.

R.I.B.A. Examinations.

To the Editor of The Builders' Journal.

Sir,— Referring to the reply to question 3, subject IV., on page 190 of the issue for October 17th, allow me to point out that a small error has crept in. There is no anti-syphon pipe shown, but what might be mistaken for same is the vent pipe to the valve box, usually carried through wall and finished with a wired end. The diagram below shows the correct construction.—Yours truly,

Chelsea. N. P.



Safe Load on Stone Column.

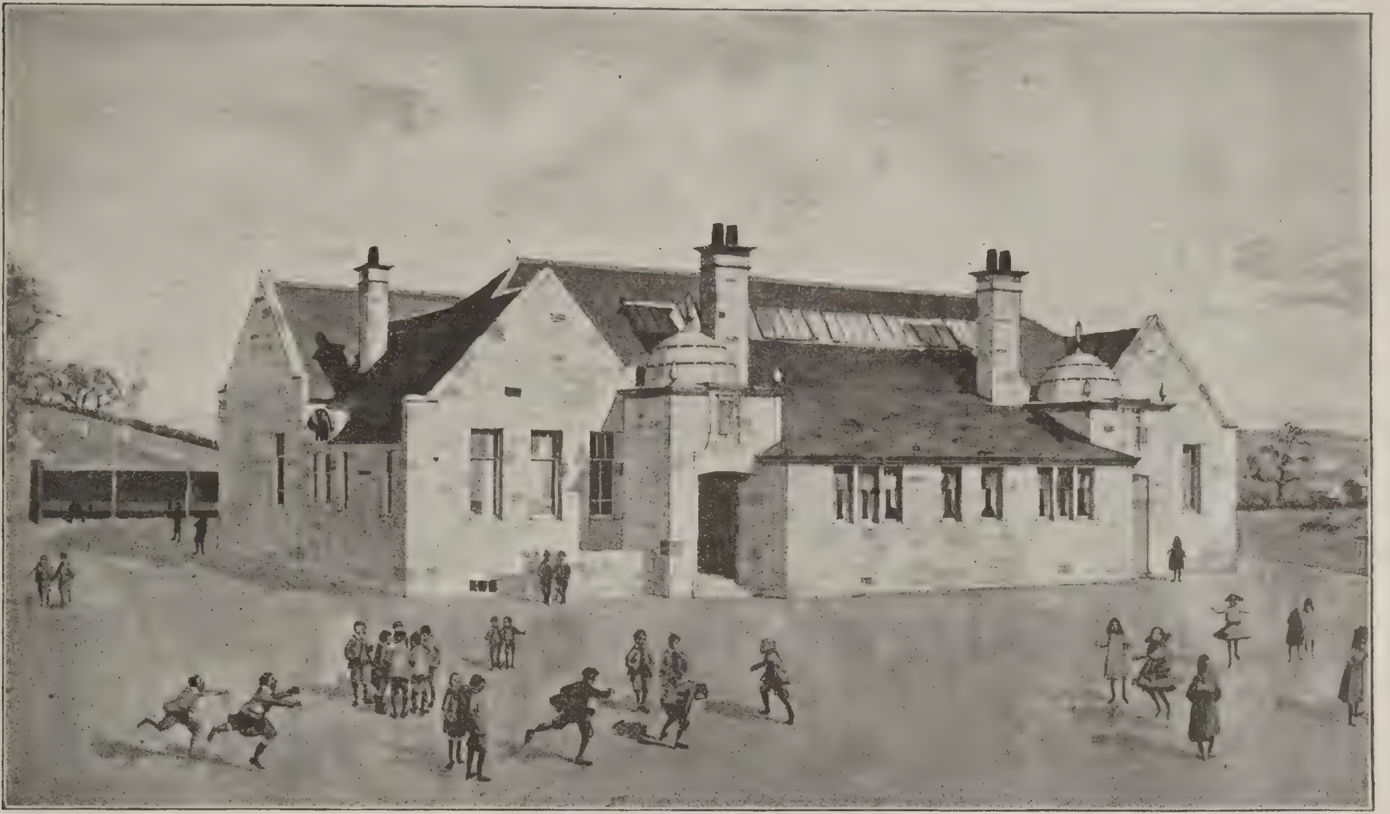
To the Editor of The Builders' Journal.

Sir,—I notice in the enquiry about "Safe Load on Stone Column," on p. 201 of your issue for last week, that "Pupil" states that the total weight of walls, &c., above an entrance porch, 14 tons, is supported by *one* Ham-Hill stone column. He appears to have overlooked the fact that there would be two columns in the *front part* of the porch, each taking an equal share of the weight, and the sides of the porch cornice or frieze would be resting either on two more columns, two three-quarter columns, or on the main wall, according to the design of the porch. There would, therefore, be four points bearing an equal share of this weight, and one column would, therefore, only be bearing ¼ of 14 tons, or 3 tons. The crushing weight of Ham-Hill stone is 207.5 tons per sq. ft.—Your truly,

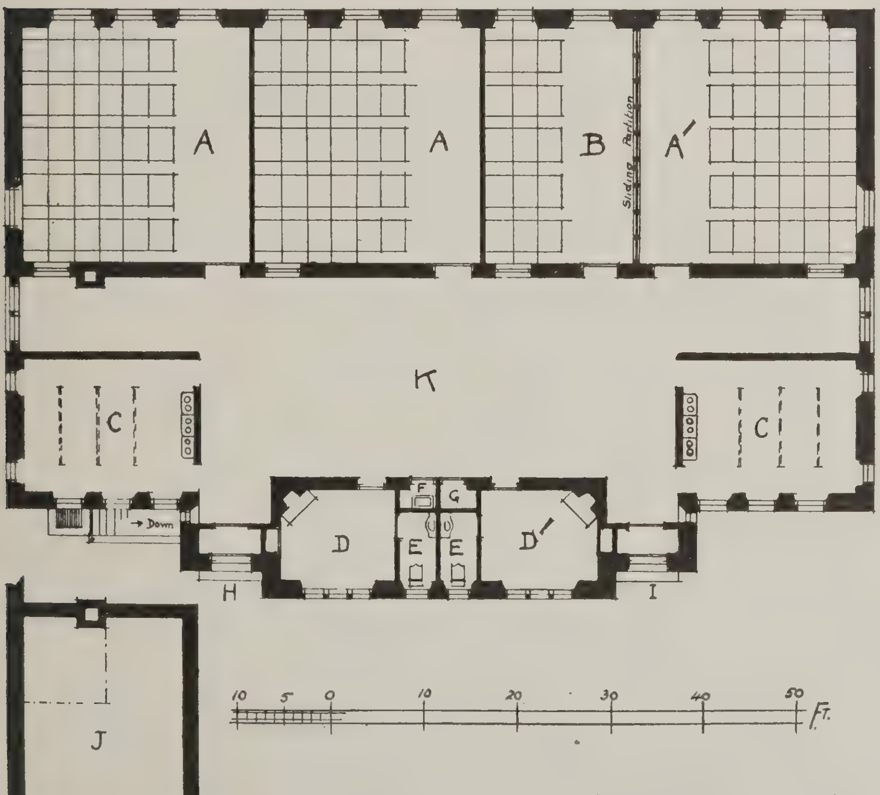
Yeovil. R. W. Staple.
Ham-Hill and Doulting Stone Co., Ltd.

Obituary

Mr. Walter Edwards, a well-known Chester architect, died last week, aged 59. For upwards of 40 years he was associated with the firm of Messrs. Douglas and Minshull, architects, Chester.



NEW SCHOOL, DRUMCHAPEL, DUMBARTONSHIRE. D. McNAUGHTAN, I.A., ARCHITECT.



A.A. classrooms for 60 scholars each, A′ classroom for infants, B, classroom for 30 scholars, C.C. cloak-rooms, D. headmaster's room, D′ teachers' room, E.E. w.c.'s, F. press with sink, G. press, H. boys' entrance, J. heating chamber, K. drill hall.

This school is an elementary one for boys and girls. The building is of white stone from Auchinlea quarry, and is slated with West Highland slates. The boys and girls have separate entrances which open into the central hall. This hall has a wooden floor of pitch-pine in 3-in. widths, nailed to Speedwell asphalt on concrete. The walls are lined with Carolina pine 4ft. high. The roof is of wood and is open to the ridge, with roof-lights of patent glazing. The woodwork of the roof is of pitch-pine, stained to an old oak tint and finished flat. The classrooms are well lit from the south-east. The ceilings are 13ft. high, and wood dadoes 4ft. high run round the walls. Adjoining the entrances are the two cloak-rooms, with cement floors and tiled dadoes. The headmaster's room and teachers' room are at the front. The passages at each end of the hall are for possible extensions. The building is heated by means of hot-water pipes from a boiler in the heating chamber under the boys' cloak-room. Radiators are placed in the classrooms in the window breasts, and fresh-air inlets are provided at the back of them. The architect is Mr. D. McNaughtan, I.A., of 137, West Regent Street, Glasgow.

Notes and News

A New Town Hall is to be built at Harwich at a cost of £6,000.

The Architectural Association Conversazione will be held on November 8th at 18, Tufton Street.

The Chancel of Govan Parish Church is to be lengthened from designs by Sir Rowand Anderson.

A New Cotton Mill.—Arrangements have been made for the erection of another cotton mill at Castleton, near Rochdale. It is to be called the Arrow.

A New London Concert Hall.—St. Paul's Church, Great Portland Street, London, is being demolished to make room for a new concert hall to be built on the site.

New Municipal Offices at Coventry, including a number of shops on the ground floor, are to be erected at a cost of £30,000.

At St. Matthew's Church, Willesden, the nave has now been completed, with narthex and western gallery, from designs by Mr. W. D. Caröe. The cost of the work has been £4,000.

Mr. Frank Brangwyn's new Fresco at the Royal Exchange was unveiled last week. It represents "Modern Commerce," forming a companion picture to "Ancient Commerce," by the late Lord Leighton.

An Oxfordshire Church.—The tower and belfry are being restored to Souldern Church, near Banbury, under the direction of Mr. G. F. Bodley, R.A., many of the old stones being re-used.

Scarisbrick Hall, Lancs—An interesting article on this building, by Mr. F. H. Cheetham, appears in the "Southport Visitor" for October 11th. Scarisbrick Hall is the work of Pugin, and its chief feature is the great banqueting hall, 45ft. by 30ft. by 80ft. high to the top of the lantern.

The New G.P.O. Buildings on the site of Christ's Hospital, Newgate Street, will be constructed on the Hennebique system of reinforced concrete. The architect is Sir Henry Tanner, principal architect to H.M. Office of Works.

Selby Abbey.—Mr. Oldrid Scott, architect to Selby Abbey, says the stonework in the nave is practically intact, but that of the north transept must be replaced, while the tower has been completely gutted by the fire.

Mr. T. Taliesin Rees, F.R.I.B.A., has been appointed architect to the Birkenhead Education Committee at a salary of £300 a year. The appointment does not debar Mr. Rees from carrying on his private practice at Liverpool.

A New Architectural Society.—A meeting of architects practising in Gloucester, Cheltenham and Stroud was held at Gloucester last week, Mr. F. W. Waller, F.R.I.B.A., in the chair, when it was decided to form a society representing the district.

The Memorial to the late Marquis of Salisbury erected in front of the entrance gates to Hatfield House represents Lord Salisbury seated in a chair and holding a scroll, and is set on a stone pedestal. Mr. George Frampton, R.A., was the sculptor.

A new L.C.C. Board School at Lewisham has been built by Messrs. Treasure and Son at a cost of £19,438 from designs by the council's (education) architect, Mr. T. J. Bailey. The school is in three departments and accommodates 1,200 children.

A Blackpool Scheme.—A scheme is under consideration by the Town Council of Blackpool for erecting a new building, to cost £40,000, over the present open market in the business centre of the town. A museum and art gallery would be provided.

An Institute and Reading Room has been erected at Llangefni, Anglesey. The architect was Mr. Richard Hall, of Bangor, and the contractors were Mr. T. P. Thomas, of Llanfair (for the general work), and Mr. Philip E. Jones, of Bangor (for sanitary and plumber's work).

A New General Post Office at Hanley has been erected from designs by Mr. John Rutherford, H.M. Office of Works. It is a well-proportioned stately building, for which we are profoundly thankful, recollecting the poor stuff which the Post Office Department has been wont to inflict on the provinces.

The Marble Arch Scheme prepared by Mr. F. W. Speaight, consisting in forming a large open space at the back of the Arch, with a crescent screen against Hyde Park, was adopted by the Marylebone Borough Council at their meeting on Friday last. The scheme is intended to relieve traffic, and is estimated to cost £25,000. In the opinion of the Council, the expense should be borne by county or national funds.

The Manchester Society of Architects is now in possession of its new home at St. Mary's Parsonage, which the Society has been enabled to acquire with the sum of money left by the late Mr. Alexander Mills, F.R.I.B.A., of Manchester. The first annual meeting of the students of this Society was held last week, when there was an exhibition of work done during the holidays. Mr. Roger Oldham took the chair.

The Ceiling of the Banqueting House in Whitehall, by Reubens, is to be restored. It has already been restored four times, once in the reign of George II., by Kent; in 1785 by Cipriani; in 1837 under the direction of Sir Robert Smirke (when the entire building was restored at a cost of £15,000 by Sir John Soane); and again at a later date in the nineteenth century.

A New Church at Sparkhill, Birmingham, is being erected from designs by Mr. Arthur Harrison, F.R.I.B.A. The contract has been let to Mr. Frank Davis, of Moseley, who is under an agreement to complete the work in about nine months. The church is estimated to cost £7,000, with seating accommodation for 705 worshippers, the main body of the building being 100ft. by 48ft.

Marischal College, Aberdeen, is not (Mr. Harry Hems points out) "the largest granite building in the world." Its total length is 400ft., width 60ft., average height 60 ft., and cost £200,000, while, by contrast, the new Pennsylvania State Capitol, also built of granite, is 520ft. long, average width more than 200ft., average height 100ft., and cost £2,600,000.

The National Trust.—At the last meeting of the executive committee it was announced that £580 was still needed to effect the purchase and repair of Barrington Court. It was decided to urge the preservation of the Ironmongers' Company's almshouses in Kingsland Road, Shoreditch, built in 1712. The sale of the site for building purposes is contemplated.

Proceedings of Allied Societies.—We have received the annual reports of the Liverpool Architectural Society and the Sheffield Society of Architects and Surveyors; also the Green Book of the Birmingham Architectural Association. The last-named is very well got up, and among the illustrations included in it is a very effective colour sketch of Caudebec by Mr. Arthur Harrison.

The Prince of Wales's Grate.—At Pond House, a block of new municipal dwellings at Chelsea, the grates used are the outcome of a suggestion made by the Prince of Wales, when, some time ago, he opened the Sir Thomas More Buildings at Beaufort Street, Chelsea. By means of sliding panels the heat from the kitchen grate can be diverted to the sitting-room when the family assemble there in the evening.

At Frisk House, Burnham, a new residence in course of erection by Mr. H. W. Polland (Mayor of Bridgewater), a complete electric lighting installation has been carried out by the well-known firm of Messrs. Duncan, Watson & Co., of Charing Cross Road, London, W.C., under the supervision of their engineer, Mr. A. W. Ashman. The installation is described as a model of country-house lighting.

"Isolated Homes for the Aged Poor v. the Workhouse."—The paper with this title which Mr. A. Saxon Snell, F.R.I.B.A., F.R.S.I., read at the recent congress of the Royal Sanitary Institute at Bristol has been issued in pamphlet form from the offices of the Institute, Parkes Museum, Margaret Street, W. Some plans are given of Mr. Snell's scheme of model homes, together with plans of married couples' quarters for the Holborn, St. Marylebone and Fulham Boroughs.

Hospital Wall Surfaces. — The best arrangement for the walls of hospital wards appears to be a good foundation of cement, with several coats over it of one of the enamel paints. The paint dries fairly quickly, and if properly put on upon a carefully-laid foundation of cement, it presents a perfectly even surface, as smooth as the surface of glazed tiles, and very nearly as smooth as that of the glass tiles.—"The Hospital."

Ingham Church struck by Lightning.—The stately tower of Ingham Church, Norfolk, was struck by lightning recently and greatly injured. At the north-west angle a lightning conductor was fixed some fifty years ago, and has proved to be a very inefficient safeguard, as the pinnacle adjoining it was struck, and although the upper portion remains, all the massive stonework, from its base to the upper string-course, has been torn away. The tower has been struck by lightning before.

The Paving of Whitehall.—The tender of the Improved Wood Paving Co., at 9s. 6d. per yd. super., was the next lowest to that of the Acme Flooring and Paving Co. In view of the defaults of this latter company in the paving of Whitehall, the Improved Wood Paving Co.'s tender has now been adopted by the Westminster City Council, subject to the company allowing the Council 1s. 7d. per yd. super. for the work already executed by the Acme Flooring and Paving Co.

A Block of Flats seven storeys high, to be called "Green Court," is to be erected on a site having a frontage of 225ft. to Shepherd's Bush Green. The building is to contain 156 self-contained residential flats of from three to five rooms each, and will be built in three sections. Messrs. Palgrave & Co. are the architects for this building, and also for a block of fifteen shops, called "The Market," about to be erected with a frontage of 254ft. to Turnham Green Terrace. For the latter, Messrs. R. Ward & Son are the contractors. The contract has been signed and the work is to proceed immediately.

Welbeck Abbey Glasshouses.—The Duke of Portland is having a considerable section of the glasshouses at Welbeck renewed and modernised. The new work includes: Span Corridor, 280 ft. by 16 ft.; three span plant houses, each 43 ft. by 20 ft.; six span houses, each 37 ft. by 12 ft.; span propagating house, 60 ft. by 12 ft.; also lean-to range, comprising three fig houses and two vineries, 300 ft. by 15 ft. The work of erecting the new houses has been entrusted to Messrs. Messenger and Co., Ltd., the well-known horticultural builders of Loughborough and London.

The Value of Adams' Patent Automatic Sewage Lift has long been realised in this country and abroad. This fact is borne out by the many important installations carried through by the sole manufacturers, Messrs. Adams-Hydraulics, Ltd., of York, &c., who have now in course of erection plants for the War Office, the Heywood Town Council, Messrs. Van Houten, Holland (the well-known chocolate manufacturers) and many others. Probably the most comprehensive scheme is that at Douglas, I.M., where the whole of the low-level sewage is raised by the high-level sewage without cost, an annual saving of between £600 and £700 thus being effected.

Enquiries Answered.

Dimensions of Greek Buildings.

Exeter.—Inter writes:—"What are the respective values of a module of the temples illustrated in Mr. Phené Spiers' 'Orders'? The scales given seem only to allow of them being worked out approximately. For instance, in the Choragic monument of Lysicrates the module scales 7.35ins. Pennethorne gives the base of the Lysicrates column as 13.52ins., which would fix the module at 6.76ins. Mitchell gives the Parthenon as 3.191ft."

It should be remembered that the dimensions of the various columns and parts of the Orders vary. Thus, the angle columns were usually stouter than the intermediate columns; also, the upward curvature of the stylobates and of the architraves of temples are different; hence the heights of the columns vary along the faces and flanks of the temples. The writers upon the Orders have apparently in some cases given dimensions which they consider to be typical, or else they show the dimensions of the angles of temples or of those columns which they have found in the most perfect state of preservation. Hence it is that the dimensions given by various authorities for the same example vary, but such variations only affect the second or third decimal part of an inch. With regard to Spiers' "Orders," it will be found that the dimensions he has given almost always agree with those given by Stuart and Revett in "The Antiquities of Athens." Stuart and Revett show, for the most part, particular columns with the corresponding parts of the entablatures accurately measured from the actual temples. If you have a mind for great accuracy, you should consult the above work (the large edition), Penrose's "Principles of Athenian Architecture," Inwood's "Erectheion," and similar works. In the case of the Choragic monument of Lysicrates, the dimensions of the external portion of the columns (which is larger than the internal portion) is given by Stuart and Revett as 1ft. 2ins., making the module .7in. For the accurate dimensions of every part of the Parthenon, consult "Principles of Athenian Architecture." To measure the examples given by Spiers to a greater degree of accuracy in feet, you might construct diagonal scales in hundredths from the plain scales of feet given. H. Y. M.

Dorset writes:—"What is the exact distance (in modules) between the columns in the Temple of Theseus, Athens? The intercolumniation of the two columns at the extremities of the peristyle is, of course, narrower than that of the others. What is the width of the end metopes, and are they the same size as all the others along the frieze?"

The Temple of Theseus has a hexastyle façade. The angle columns measure 3ft. 4.85ins. in diameter, and all the intermediate columns measure 3ft. 3.4ins. diameter. The inter-columns measure from the angle towards the centre 4ft. 6.35ins., 5ft. 4.05ins., and 5ft. 3.95ins. respectively. These dimensions are similar on both sides of the centre. The dimensions are here given in feet, as the columns vary in diameter, so that the figures representing the spacing of the columns will vary according to which diameter you take to give the module. The angle triglyph measures 1ft. 8.3ins. across, and the first metope from the angle measures 2ft. 6.475ins. across. The intermediate triglyphs are practically of the same dimensions as the angle triglyph, and the triglyphs are spaced centrally over the columns, thus fixing the size of the intermediate metopes.

Account Books for Brick and Tile Works.

I. W. writes: "Do you know of any firm which makes a speciality of account books for brick, tile and pottery works? A company in which I am interested requires a set of books and would be glad to have a special system."

We do not know of any such account books. Possibly some reader may be able to furnish the desired information.

Building Stone near Tavistock.

Plymouth. A. W. P. writes: "Which is the most suitable stone for general walling purposes to be found in the neighbourhood of Tavistock? Is it suitable for churches in rural districts? What freestone would be most suitable to use for window dressings, tracery, &c., in first-class work in the above district?"

The only quarry of any importance in this part of England is Pomphlet, near Plymouth, which supplies a limestone for general building purposes in blocks up to 100 tons, having a crushing resistance per foot super. of 58 tons and a weight of 168 lbs. per ft. cube. This stone is also used for the manufacture of building lime. It is quite suitable for churches in rural districts, and can be used for window dressings, tracery, etc. The Royal Oak granite quarries are situated near Tavistock. H. Y. M.

TWO GREAT BUILDINGS AT CARDIFF.

Monday's opening of the new City Hall and Law Courts which have been erected in Cathays Park, Cardiff, marks the completion of a great undertaking. It very rarely happens in this country that architects have at their disposal such splendid sites as that at Cardiff, and it is all the more gratifying, therefore, to see what excellent use Messrs. Lanchester and Rickards have made of their opportunity. The buildings are worthy to rank among the best examples of modern English architecture—more especially the Council Chamber, with its finely-proportioned dome, and the magnificent sculpture decorating it. We do not know of any recent building where sculpture and architecture are combined to better effect, and we think this is all the more satisfactory when we remember that at Cardiff this sculpture work has not been done by Royal Academicians or other men who usually secure the big opportunities, but by a band of younger and less-known men. Their work is of great ability and in perfect accord with the architecture, which result must be attributed to the close collaboration between architects and sculptors. In the interior of the building the enrichment and decoration is sparingly applied, and in every case kept within the architectural lines. The undertaking has been in progress for several years and has involved an expenditure (including site) of nearly half a million of money. So fine a piece of work is worthy of being put on adequate record. "The Architectural Review" recognises this, for in its November issue will be given a series of 35 interior and exterior photographs of these two notable buildings.

AN ADDRESS TO GLASGOW STUDENTS.

Mr. James Miller, A.R.S.A., F.R.I.B.A., delivered an address to the Architectural Craftsmen's Society at the Glasgow Technical College on October 19th. After pointing out that the architect's drawings were only means to an end, and that the success of the work was largely dependent on the ability of the craftsmen who carried it out, Mr. Miller went on to emphasise the importance of "efficiency"—in scheme, planning and construction. This demand for efficiency was equally on the craftsman as on the architect. We frequently heard of the professions and trades being overcrowded, but with what? Was the architectural profession overcrowded with able and capable draughtsmen? Were the trades overcrowded with efficient tradesmen? He hardly thought so. There was, indeed, a decided lack of good and capable men, both in the professions and the trades. In this respect an institution such as theirs was a great boon, because it trained men to become capable members of their craft. No doubt many of those he was addressing intended later in life to become clerks of works, or to start business for themselves. Now,

the position of the clerk of works

was a most important one, and it certainly was not overcrowded with efficient men. In a building of any magnitude there were many points which, as the work proceeded, might be altered or modified with beneficial results, and it should be the duty and ambition of the clerk of works to look out for these points and report his ideas to the architect. It might be urged that the architect's drawings ought to be perfected before they left his hands, but in answer to that Mr. Miller said there was no such thing as perfection in planning or design, and it was a great mistake to imagine that because the plans were prepared and matured it was too late to make an alteration—not radical rearrangements, of course, which ought not to be necessary, but minor alterations in detail, which might be found desirable as the building grew.

Mr. Miller then went on to particularise on the necessary and desirable qualifications of a clerk of works—knowledge of materials, capacity of looking ahead, ability to lay down details and extend plans, close inspection and supervision, &c. With regard to this last, however, no amount of care and watchfulness on the part of the clerk of works would guarantee good workmanship; this could only be assured by the employment of capable craftsmen who understood their work and did it conscientiously. Industry was the great thing. As Sir Joshua Reynolds had said, "You must have no dependence on your own genius. If you have great talents, industry will improve them. If you have moderate abilities, industry will supply their deficiency. Nothing is denied to well-directed labour. Nothing is to be obtained without it."

The profession of architecture

was next dealt with by Mr. Miller. Let no student think it was an easy career. The work of an architect was interesting, fascinating, but before attaining success he had to make up his mind to put in a great deal of hard work, and suffer many disappointments. Nevertheless, he might enter upon his task with good cheer, provided he had a natural aptitude for the work. This was essential. Many students, unfortunately, were lured into the circle of architecture by considerations other than fitness or aptitude, with the result that failure usually followed.

In his studies the student would find it necessary to consider modern architecture in a different manner to the architecture of past ages. In the past the architect and craftsman studied and worked side by side, the work of the one merging into that of the other; the individualism of modern work was entirely absent in the work of the Middle Ages. The advancement of science and engineering had led to the specialising of work of all kinds, and the function of the modern architect had become more one requiring him to direct and guide than to take any practical part in the work himself.

The architectural student should make himself thoroughly familiar with the best work of past ages, and he should also study the best current work, for power of invention and originality of conception would be in proportion to one's knowledge of the work of those who had excelled.

This knowledge of old and new work could best be obtained by studying actual buildings, and by sketching and measuring them—not trusting to memory, but jotting down memorising sketches of anything that was worth noting. In this particular Mr. Miller said he had been greatly struck recently by the method followed by a London firm of designers. This firm, in addition to a good library, had a large cabinet of drawers filled with sketches, photographs and cuttings of illustrations of all kinds of ornament from multitudinous sources, all classified into styles, and subdivided into groups—such as carved panels and mouldings, caps and pilasters, &c., the whole system most complete and painstaking and one to be strongly recommended.

Students should not be carried away with the idea that one must always be original, producing something altogether new. "By all means be original if you wish, if your originality is to be as good, or better, than anything that has been done before, but make sure that it is so before you attempt it."

Replying to a vote of thanks, Mr. Miller referred to the manner in which the work of the Architectural Section of the College was carried on under the guidance of Prof. Gourlay. The architects of Glasgow were indebted to Prof. Gourlay for the earnest and thorough way in which he conducted the work.

VIRGINIA CREEPER ON ANCIENT BUILDINGS.

"F. S. A.," in a letter to the "Times," says that when visiting Oxford and Cambridge recently he was "much concerned to see how in both places the college buildings are being overwhelmed with Virginia creeper. This may afford pleasure to the casual sightseer, especially at this time of the year, when the colour is vivid; but to all who have any knowledge or love of architecture it is a condition of things greatly to be deplored. Interesting bits of detail and features which may furnish valuable clues to the student of architecture are gradually disappearing, and the history of the buildings, so far as it can be read in their stones, bids fair to become shrouded in impenetrable mystery. To mention a few instances at Oxford, the east window of the chapel at Oriel, where the tracery is a curious example of early 17th century treatment, is almost submerged; the quaint twisted columns of the porch of St. Mary's Church are hardly visible; and the late 17th century chapel at Trinity is so completely overgrown that its windows are merely irregular orifices in the foliage, and the cornice is only to be detected by the band of blurred shadow which its projection causes. . . At Cambridge the mischief is, perhaps, not yet quite as bad as at Oxford; but with so vigorous a grower as the plant in question it is only the matter of a year or two for both places to be in the same evil plight."

In reference to the foregoing, Mr. H. E. D. Blackiston points out that the statements are only half true as regards the 17th century chapel of Trinity College, Oxford. "The south front is thickly covered with Ampelopsis, which has not been very recently trimmed. It is beautiful and also useful as retarding the erosion of the soft and flaky Headington stone. The north side of the chapel, within the quadrangle, is, of course, architecturally identical with the south side; it is less exposed to the weather, and there is not a vestige of any creeper on it."

"Orielensis" observes that "F. S. A." in describing the east window of the chapel at Oriel as "a curious example of early 17th century treatment," pays a compliment to Mr. T. G. Jackson, from whose design it was erected in 1885.

HOTEL GWALIA, LONDON.

This hotel is to be erected in Upper Woburn Place, a part of London which is rapidly becoming a centre for hotels. The thoroughfare is in direct line with the newly-opened Kingsway. The Hotel Gwalia will be equipped in the most modern style, and will contain 100 bedrooms. The site has a good area. The floors throughout will be of fireproof construction. The facings of ground and first floors, as well as dressings generally, will be in Portland stone, with cherry-red brick facings above; while the Mansard slope will be laid with Westmorland green slates. Some of the directors of the well-known Gwalia Hotel at Llandrindod Wells are interested, and will be closely identified with the new company. The architect is Mr. Alfred Swash, of Midland Bank Chambers, Newport, Mon.

Views and Reviews.

A Good Book of Country Cottages.

With the great interest displayed in small houses during the last few years—an interest quickened by the holding of cottage exhibitions in several parts of the country—numerous books on the subject have made their appearance. Many of these books, however, have been lacking in architectural interest by reason of the fact that they have not been compiled by persons familiar with the trend of thought and design among the best architects of the day. With the book now before us, however, the case is different, for Mr. J. H. Elder-Duncan, in his capacity of Editorial Secretary to the *Architectural Review*, has been kept in touch with the best modern work. Architects and the public, therefore, are very much indebted to him for bringing together such a collection of well-designed houses as given in this book, and it is gratifying to see that in very nearly all instances the houses are shown by photographs of the completed work, and accompanied by plans. The bulk of the book is made up of this collection of illustrations, excellently printed, and with notes on each of the houses shown. In addition, there are several chapters dealing with general matters of design and construction, such as the question of the site, water supply, lighting, planning, decoration, lay-out of gardens, &c.

As there are more than 100 houses included in the book, ranging in cost from £175 to £3,500, it is quite impossible for us to attempt any list of them, but we would mention, as indicating the quality of the work included, that photographs are given of houses by Messrs. Brewill and Baily, Buckland and Farmer, Horace Field, T. Phillips Figgis, Ernest Gimson, A. J. Hardwick, P. Morley Horder, Percy B. Houfton, H. G. Ibberson, Mervyn Macartney, C. E. Mallows, Ernest Newton, Nicholson and Corlette, Niven, Wigglesworth and Falkner, H. L. North, Godfrey Pinkerton, H. R. and B. A. Poulter, C. H. B. Quennell, John W. Rhodes, Halsey Ricardo, R. Weir Schultz, M. H. Baillie Scott, Charles Spooner, C. F. A. Voysey, Edward Warren, William H. White, A. Needham Wilson, Edgar Wood and other well-known architects.

Altogether the book is one we can strongly recommend.

"Country Cottages and Week-end Homes," by J. H. Elder-Duncan. London: Cassell & Co., Ltd., price 5s nett.

The Cathedrals of England and Wales.

With the appearance of the third volume comes the opportunity of reviewing this work as a whole. The author found time while he had it in hand to add another desirable work to this series—the "Cathedrals of Northern Germany," and his very extensive knowledge of the cathedrals of other countries has been of great service here. There are numberless guides to our cathedrals which would be bad indeed if not rendered desirable by the introduction of some special feature, and in this particular case the lack of tabulated information, and illustrations of any value, is atoned for in great measure by the writer's extensive knowledge, and by his generous appreciation of quality in architectural work, irrespective of style or period. Assuming, as he does, more knowledge of building than the reader has as a rule, it follows that the worth of Mr. Bumpus's volumes is more likely to be understood by those who already know a good deal than by the millions of guide-book buyers for whom such things are produced. Too big for the pocket, they are designed for the library and for the longer life that the more fortunate have. Peculiar to these volumes is the amount of information vouchsafed about the music-makers of the cathedrals. Peculiar, also, and less happily introduced, are the anecdotes with which they are padded. These seem out of keeping with the austerity of the buildings to which they relate, and the space which is occupied by them might as well have been filled by the plans which are lacking here, or by a more satisfactory index.

"The Cathedrals of England and Wales," Vols. I., II. and III., by T. Francis Bumpus. London: T. Werner Laurie, 13 Clifford's Inn, price 6s. nett each volume.

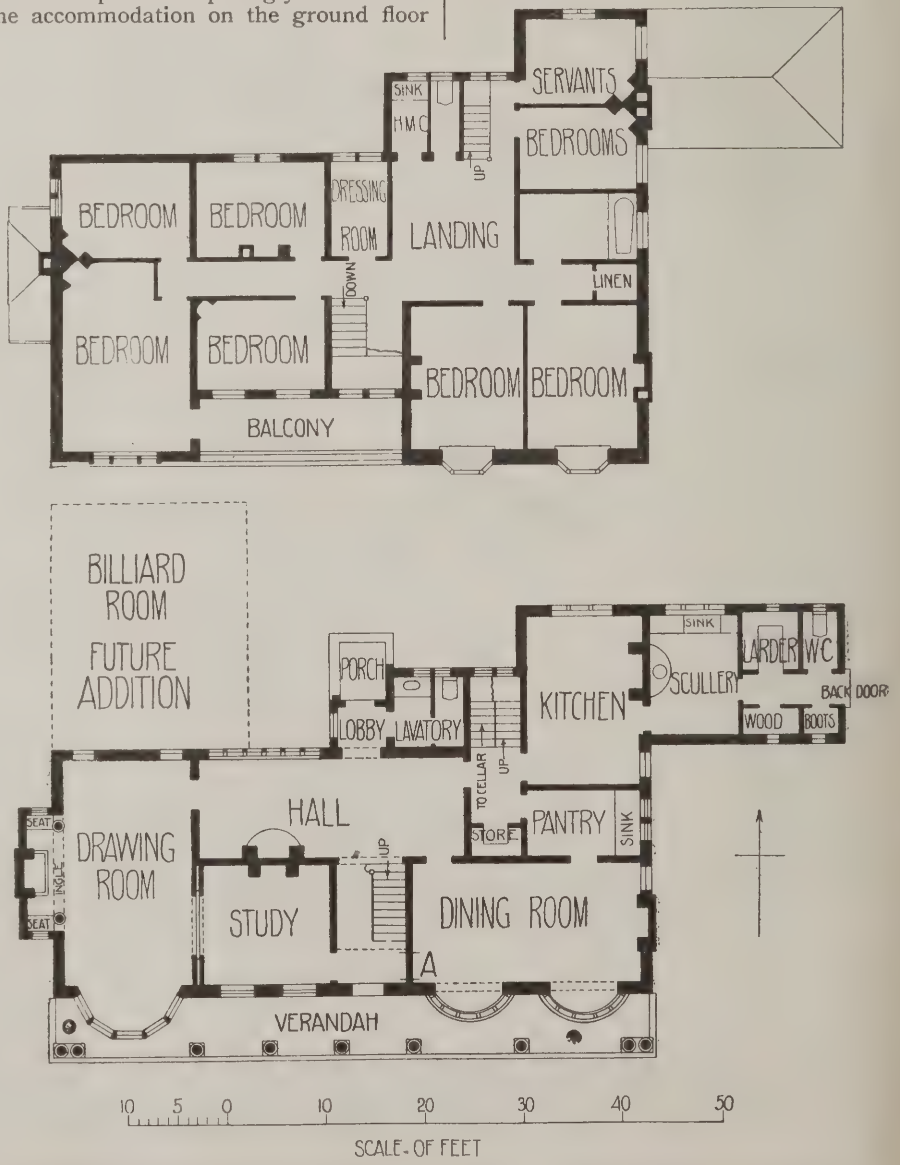
Our Plates

"Woodcote," Camberley.

This house is situated on a gravel hill. The walls are of oak timber framing left rough, filled with Taylor's bricks, which are cement rough-cast and whitewashed. The roofs are covered with old tiles from barns at Frimley. Internally the walls are finished in white plaster, with oak joinery throughout, and heavy oak ceilings. For the glazing $\frac{3}{8}$in. leads are used, with decorative portions sparingly introduced. The accommodation on the ground floor is shown by the plan on the illustration; the first floor comprises three bedrooms, with dressing-room and bath-room, night and day nurseries; the attic two bedrooms and box-room; with a cellar in the basement. The complete cost of the house worked out under 7$\frac{3}{4}$d. per foot cube. Mr. W. H. Tarrant, of Frimley, was the builder, and Messrs. H. R. and B. A. Poulter, of Camberley, were the architects.

Proposed House near Leatherhead.

This house has been designed for a site on the Pachesham Park Estate, Leatherhead. The chief rooms have a southern aspect and open on to a verandah, extending along the whole south front, with a small balcony over the centre portion. The plan is so arranged that by shutting a door from the hall the whole of the kitchen wing can be completely cut off by a ventilated lobby, containing servants' staircase; service being through the pantry. The provision of an additional door to the dining-room at the point marked "A" will enable guests on special occasions to circulate through the entire ground floor suite. Red facing bricks are intended for the ground floor, with rough-cast above; roofs of green Westmorland slates; and all external woodwork of deal, painted white. The estimated cost is £2,500. The architect is Mr. Lionel G. Detmar, A.R.I.B.A., of 1a, St. Helen's Place, E.C.



PROPOSED HOUSE NEAR LEATHERHEAD. LIONEL G. DETMAR, A.R.I.B.A., ARCHITECT.

ICONOCLASTS AT EXETER CATHEDRAL.

The west front of Exeter Cathedral is the subject of an animated correspondence in the columns of the "Times." Mr. Thackeray Turner, secretary of the Society for the Protection of Ancient Buildings, says: "A short time ago the stonework of the large west window was rebuilt, and now the canopied work is being renewed. Before the work was begun my Society asked the Dean and Chapter whether they intended to publish any report or statement upon the condition of the west front and what was proposed to be done to it. A reply was received to the effect that the Dean and Chapter, having taken the advice of a competent authority, declined to share their responsibility with any irresponsible authority. The Society publicly called attention to the value of the west front and of the danger which threatened it; and although the Society was aware, at a later date, that the iconoclasts were at work, it took no further action, knowing that any remonstrance with the Dean and Chapter would be useless. . . . The most recent work done to the front is the complete renewal of a series of three or four canopies and a length of the cornice on the south division of the front. The shock of this work is almost more disturbing than any example of 'restoration' I have ever seen. . . . The canopied work is so weathered that to put a fixed form as definite as a piece of machinery on this faded lacework requires great hardihood, and that is what it has got. The great window, as you know, is now new, the upper gable is new, some of the raking arcade is new, pinnacles new. About half the front (except the images) is now new. Only a few years ago it seemed an ancient front. It looks strangely small and foolish now. . . . It is quite certain that the medieval art treasures of England cannot be of modern carved stonework, and it is time to ask whether a modern cathedral or an ancient one is required. We believe, although we are not certain, that the evil deed cannot, as usually is the case, be thrown on to the shoulders of an eminent ecclesiastical architect. Of course, the real difficulty has been and is the surface decay of stone. In the opinion of this Society, the application of lime and baryta meets this difficulty satisfactorily."

The Dean's Reply.

Replying to the above, the Dean of Exeter says: ". . . Upon examination this magnificent window [the great west window] was found to be in a perilously ruinous condition, partly from the ravages of time, exposure to weather, and natural decay, partly from the rude treatment which it had undergone when Peckitt's glass was put in about 1770; a broad and deep second glass line had been cut, greatly weakening the stonework. If left to itself the whole window would in a short time have fallen in; its condition was very serious. The work was undertaken after grave deliberation and under the best advice, and not one single inch of old work that was capable of preservation was not preserved, and not one inch of unnecessary new stonework was inserted—the result being that we have preserved with the most jealous care this magnificent window from becoming a complete ruin without having altered a single feature. . . . Mr. Turner would prefer a ruin from which all traces of the past shall have crumbled away and nothing but dust and featureless disfigurement remain. Our duty is not to provide an interesting ruin for Mr. Turner's Society, but so to arrest decay and prevent ruin as to leave behind us a glorious building which shall be in its unmutilated beauty at once a faithful witness of the architecture of the past, and the sanctuary in all its surroundings fit for the service of Christian men."

To a representative of the "Devon and Exeter Gazette" the Dean said: "The Cathedral architect (Mr. Harbottle) is now allowed an unfettered hand. Some members of the Chapter invariably inspect those portions of the building which are reported to require renewal. And, in these cases, as in the west window, every scrap of old material which can be retained is sacredly kept in place. Where new work is inserted the details of the old work are faithfully reproduced, and the most reverential care displayed in continuing the ancient features. It is impossible to make practical use of preservatives. The decay is of more than superficial depth, and, so far as the old work is concerned, it is felt that the application of lime and baryta, as suggested, would be ineffective. It is better to have faithful reproductions in new stone than a mere heap of black dust or a few broken walls of stone. That is the policy of the Dean and Chapter, and it has the warm support of the well-known ecclesiastical architect, Mr. Bodley, and the citizens of Exeter."

Returning to the charge, Mr. Thackeray Turner says: ". . . I am quite sure that if the Dean had seen the stonework in the chapter-house at Westminster Abbey, which Prof. Church succeeded in preserving, and which crumbled at a touch of the hand, he would have said it could not be saved. . . . And it is impossible that the Dean can have failed to see the ancient town-hall of Exeter and to know that it was repaired by the Society. Can he say that we have left it a ruin? The Dean says he wishes to leave behind . . . a glorious building which shall be in its unmutilated beauty at once a faithful witness of the architecture of the past. To attain this object he is destroying, instead of preserving, the actual work of the ancient builders, and substituting modern conjectural work; and I will defy anyone to honestly say that the partially new west front of Exeter Cathedral is an unmutilated and faithful witness of the architecture of the past."

For the Restorers.

On behalf of the restorers Mr. Alfred Marlborough enter the lists. He says: "More than half of the repaired west window is old work, there has been no 'modernisation'—these are matters of fact, not opinions. The decayed work at Westminster was 'in' the chapter-house, our decayed work is exposed to Dartmoor and Atlantic storms outside on the most exposed portions of the western front. I believe that the decay at Westminster was comparatively superficial and did not endanger surrounding portions of the fabric, and was not dangerous to passers-by. At Exeter the decay is deep-seated, does affect the surrounding masonry, is dangerous to passers-by. The conditions are very different. Washing with baryta does not strengthen the stone structurally, it forms a scab of the decayed stone on the face of the sound stone, which, as is the case with all scabs, has a tendency to peel off. Treatment which may be useful 'in' the chapter-house at Westminster would not do for our exposed west front.

"Local opinion as to Exeter Guildhall is very divided. I believe that it was scraped and washed; but here, again, the conditions of the two are very different. The one is a late Tudor building, which may or may not lend itself to scraping and washing, but this treatment would not suit the elaborate details of the west front, where the far more ancient work is in a far more decayed and dangerous condition. As to the work in progress, it is rather slap-dash criticism to write that any 12 alternative forms might be set up as equally 'correct'; such is not the opinion of those who are minutely and accurately acquainted with the old work, and are reasonably sure that the work in progress is in accordance with the old. Of course, it looks new, harsh, raw in contrast with the old; but it will in time tone down. The contrast is, of necessity, severe at present. As to the appearance of the old figures under their new canopies, would they have looked better if their canopies had been permitted to fall on them, breaking off a head here, an arm there, and leaving them exposed, uncanopied? It is not iconoclastic savagery, it is the tenderest sympathy for all that is venerable that moves us in what we are doing . . ."

A Note from Professor Church.

In a further letter, in the "Times" for Monday, Mr. Thackeray Turner, referring to the above statement that Prof. Church only formed a scab on the stone at Westminster Abbey, gives the following note from Prof. Church:—"The Dean of Exeter is obviously unacquainted with the nature and effects of the baryta treatment of decayed stone. Contrary to his assertions and suppositions, the decay at Westminster was not superficial but deep-seated; the baryta strengthens the stone structurally; it does not form a 'scab' and there is no tendency to peel off." Mr. Turner denies that his Society scraped Exeter Guildhall. "How could the Society do such a thing when its short name is Anti-scrape? . . . The Dean says that his new work looks 'new, harsh, raw,' and yet he would have us be satisfied with it. We are not. Great advances have been made in recent years in the methods of preserving ancient work; and I will give as an example West Ham Church tower, which, in my opinion, was in quite as bad a state as Exeter west front. It has been put into substantial repair and does not look 'new, harsh, raw,' any more than does Exeter Guildhall . . . ."

Chillon "Restored."

While dealing with this matter of restoration at Exeter it is interesting to note that Mr. Isidore Spielmann, F.S.A., the well-known art critic, asserts that the Castle of Chillon, on the Lake of Geneva, is being "restored to death." The interiors of many of the rooms have been "decorated," and structural alterations and "improvements" are in active progress. The safety of the building is in no way involved, and, with the sole object of embellishment, the windows are being enlarged and replaced by Gothic windows of a highly decorative character!

Notes on Competitions

List of Competitions Open.

Deposit for conditions given where known.

DATE OF DELIVERY	COMPETITION.
Nov. 30	LIBRARY AT NEWTON-IN-MAKERFIELD.—Cost £4,000. Particulars from C. Cole, clerk to U.D.C., Town Hall, Earlestown, Lancs. No deposit.
Dec. 12	LAY-OUT OF RIDDRIE ESTATE, GLASGOW.—Premiums of £75, £50 and £25. Particulars from A. W. Myles, town clerk, City Chambers, Glasgow. No deposit.
Dec. 31	DUAL SECONDARY SCHOOL AT GOOLE.—Premiums £50 and £25. Particulars from James W. Johnson, clerk to Governors, Council Offices, Goole. Deposit £2 2s.
Dec. 31	NURSES' HOME AT GENERAL HOSPITAL, WOLVERHAMPTON.—Particulars from J. Stephen Neil, House Governor and Secretary, General Hospital, Wolverhampton. No deposit.
Dec. 31	BATHS AT ASHTON-IN-MAKERFIELD.—Limited to architects in Wigan and Leigh Poor Law Unions. Particulars from A. Sykes, clerk, Council Offices, Ashton-in-Makerfield. No deposit.
1907 Jan. 19	LIBRARY AT PLYMOUTH.—Premiums £50, £30 and £20. MUSEUM AND ART GALLERY AT PLYMOUTH. Premiums £25, £20 and £10. Limited to local architects. Particulars from Borough Librarian, Plymouth
Feb. 1	CHILDREN'S HOSPITAL AT SUNDERLAND.—Premiums of £100, £50 and £25. Particulars from T. Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland. Deposit £1 1s.
No date.	ALTERATIONS TO UNION AND VESTRY OFFICES IN WESTBAR, SHEFFIELD. Limited to Sheffield architects. Premiums £25, £15 and £10. Particulars from A. E. Booker, clerk to Guardians, Union Offices, Westbar, Sheffield.
No date.	BRANCH LIBRARY AT DUNFERMLINE. Particulars from Secretary, Carnegie Dunfermline Trust, St. Margaret's, Hull, Dunfermline.

Children's Hospital, Sunderland.

The objectionable practice of requiring a deposit for conditions has been adopted in this competition and is being applied in its most obnoxious form. This consists in the refusal of the promoters to allow any applicant to have a set of conditions on approval, so that an intending competitor must risk a guinea before he can ascertain whether the competition is one in which he would care to engage. One architect sent a cheque with his application and stipulated that it should be returned to him if he, on his part, returned the conditions within three days. He received his cheque back without delay and is now looking out for a friend who may be the richer by a set of conditions and the poorer by a guinea. This arbitrariness and the meanness which refuses the loan of a few sheets of printed paper are in evidence all through the conditions. To commence with, a hospital for 60 patients is required at a cost of £16,000. This sum is to include boundary walls, commission to architect and to quantity surveyor and the clerk of works' salary. The accommodation is to include three wards containing 20 beds each, an operating theatre, a dispensary, an out-patients' and casuals' department, a general administration block of three floors, a laundry, a mortuary, a post-mortem room, &c., and numerous accessories. Hospitals have been built for small sums, but here is one which will tax the energies of the most economical planner and frugal specifier. Under such conditions it will not be astonishing if discrepancies occur between the estimates of architect and contractor. The promoters appear to have foreseen this, for they have, with an iron hand, inscribed a clause regardless of custom and devoid of mercy. This provides for the right of the Committee to reject any design if, upon the quantities being taken out, the tenders by contractors based upon such quantities should exceed the architect's original estimate. The right is also reserved to cancel any agreement which may have been entered into with the architect. In this case the architect shall have no claim against the Committee beyond the premium awarded to him under the conditions. There is no margin of safety whereby the contractor's price may exceed the architect's by a certain percentage. In another arbitrary clause the Committee hold themselves at liberty to reject the whole or any of the designs if they should appear to be unsuitable or of too expensive a character. The culminating point is reached with clause 20, where it is stated that "the selection of designs and the award of premiums in respect thereof shall not give any competitor, who succeeds in such selection in obtaining a premium, any right or claim to be entrusted with or appointed as architect for the carrying out of the work, or to any remuneration whatever other than the premium so awarded." The premiums, it should be mentioned, are £100, £50 and £25 for designs placed 1st, 2nd and 3rd respectively. If the author of a premiated design is entrusted with the work, his premium is to merge in his commission, which will be at the rate of 5 per cent., and is to include for attendances at committee meetings, railway fares, hotel expenses, &c. An assessor is to be appointed to *assist* the Committee in judging the merits, suitability and cost of the various designs submitted. That his decision will not be held as final and binding will have been gathered from the numerous reservations of the Committee referred to in the foregoing comments.

Nurses' Home, Wolverhampton.

The size of the building may be gauged roughly by the number of bedrooms required—namely, 52 of an average size of 100 sq. ft. each. Except that the cost of £5,000 seems none too much for the amount of accommodation, the competition looks satisfactory. An assessor is to be appointed. There are no premiums, but this is of small moment in a work of this value.

A Glasgow Building Estate.

We notice in the "Glasgow Herald" a letter from a Glasgow architect in reference to the competition for laying-out an estate belonging to the Corporation at Riddrie. This correspondent states that from the debate at the last meeting of the Town Council it would appear that there was only a slender chance of the houses proposed being built, and he protests that the premiums offered, £75, £50 and £25, are altogether insufficient, bearing in mind the amount of money involved in the scheme. He also draws attention to the fact that there is no absolutely independent assessor.

Branch Dispensary, Smethwick, Birmingham.

For this building, to be erected at the corner of Cape Hill and Durban Road, Smethwick, the design of Mr. F. J. Gill, of Smethwick, has been selected. There were four other Birmingham architects invited to submit designs. The dispensary is estimated to cost £5,000.

A South African Competition.

A competition has recently been decided for new headquarters for the Bank of Africa to be built in Capetown. Mr. Reginald Blomfield, A.R.A., was the assessor. The design by Mr. Thomas A. Sladdin, F.R.I.B.A., of Capetown, was placed first and has been accepted by the Bank. The next four designs were by the following competitors, who were awarded an equal proportion of the honorarium voted by the Directors:—Messrs. Baker and Masey, William Black, Parker and Forsyth and Stucke and Bannister.

Grammar School at Ambleside.

The design of Messrs. Walker, Carter and Walker, of Windermere, for a new grammar school at Ambleside has been selected in competition by the Governors of the Kelsick Trust.

Schools at Consett.

In the competition for new schools at Consett, for the Durham County Council, the assessor, Mr. W. Rushworth, F.R.I.B.A., has awarded first place to Mr. W. H. Knowles, F.S.A., Newcastle; 2nd, Mr. J. Garry, F.R.I.B.A., Hartlepool; 3rd, Messrs. Church and Moscrop, Darlington.

Proposed County Offices for Somerset.

At the last meeting of the Somerset County Council it was decided that plans and estimates should be obtained from one or more competent architects resident in Somerset for the schemes reported upon by the County Surveyor for building new county offices on the old Taunton prison site or the one adjoining the Shire Hall.

IN PARLIAMENT.

(*From our Press Gallery Representative.*)

Glastonbury Abbey.

Replying to Major Anstruther-Gray on Friday last in reference to the projected sale of Glastonbury Abbey, Mr. L. Harcourt said the matter was receiving very careful attention, the Acting Inspector of Ancient Monuments having visited the Abbey during the last few days.

Regent's Park Fence.

In answer to Sir Samuel Scott, who raised the question of the substitution of an iron spiked fence in place of the present oak timber palings around Regent's Park, to which residents strongly objected, Mr. Harcourt said he was unable to stop the work and allow the timber fence to remain because it was in a state of decay and past repair.

Selby Abbey.

On Friday Mr. Lane-Fox drew attention to the fire at Selby Abbey and asked the Chancellor of the Exchequer whether His Majesty's Government could make any grant or give any assistance in the work of restoring the building, bearing in mind that when York Minster was burnt down in 1829 the Government of the day gave a grant of £5,000 worth of oak from the Government dockyards towards its restoration.

The Chancellor of the Exchequer (Mr. Asquith) said he had made enquiries at the Record Office, but had not been able to ascertain precisely what occurred in 1829. The present case did not appear *prima facie* to be one to which the Government could properly make a grant of public money, but he had no official information, nor had he received any application on the subject.

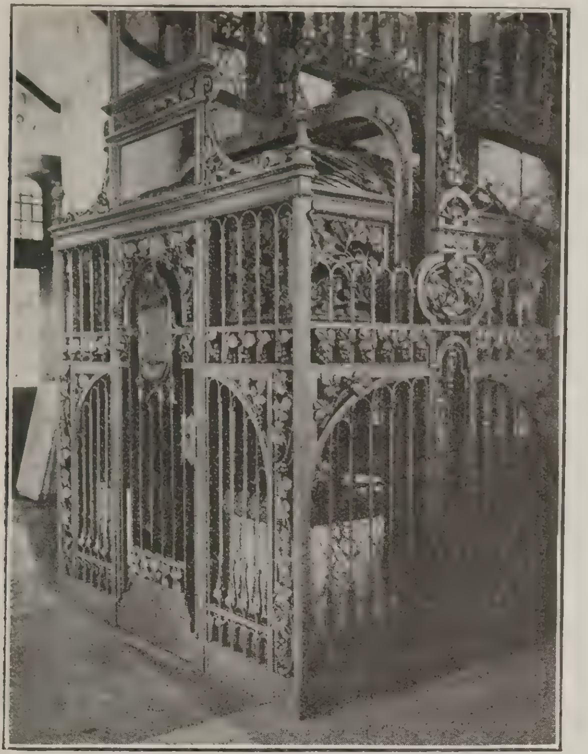


FIG. 1.—AN ELABORATE METALWORK LIFT ENCLOSURE.

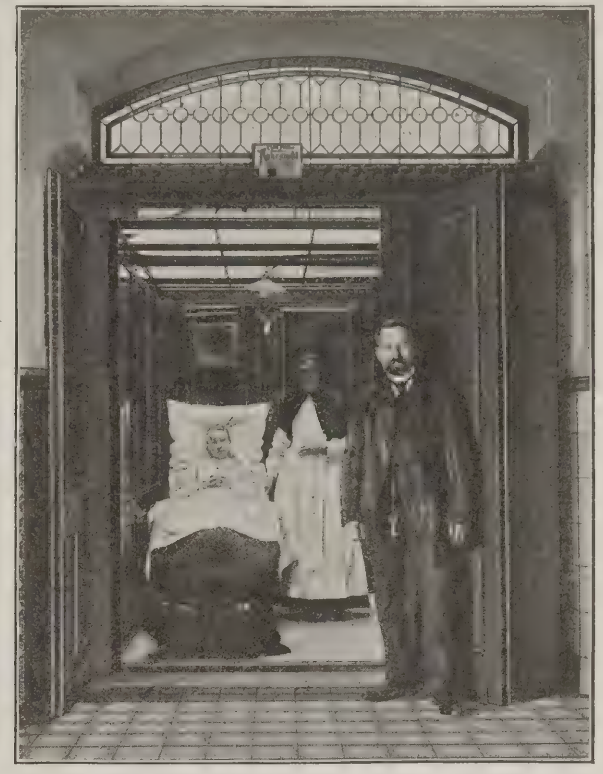

FIG. 2,—LIFT AT THE ST. MARIEN HOSPITAL, DÜSSELDORF.

Trade and Craft.

Electric Lifts.

The firm of Carl Flohr, founded in 1852, was one of the earliest engaged in the manufacture of lifts, cranes and similar appliances. Mr. Carl Flohr is recognised in Germany as a pioneer in this branch of construction. The firm claims, with apparent good reason, to be the first to introduce safety devices, and the German by-laws, which first required lifts to be equipped with such safety devices, were modelled on the Flohr lifts as a standard. On the Continent the firm has been very successful in securing gold medals and other awards at various exhibitions, and it is now one of the largest engaged in this branch of industry. To-day about 1,200 Flohr lifts are in use all over the world. A London office has just been opened at 73a, Queen Victoria Street, E.C., and a sumptuous English catalogue issued. The firm has introduced many striking contrivances that have been copied by other makers, and it has continued to keep in the front rank, but details of connections and various mechanical devices are of interest only to specialists, and we confine our remarks, therefore, to various general features of design. From the public point of view, safety-catches and safety-locks are of primary importance, and by-laws chiefly concern such parts, but, in addition to these, the modern lift is provided with signal apparatus, annunciator, automatic stop devices, and speed regulator, all of which directly or indirectly bring it to a standstill in the case of danger. Accidents hardly ever occur with modern lifts, and then only as a result of gross neglect. Messrs. Flohr have always paid special attention to such matters. They make a speciality of invariably fitting safety devices to goods lifts also, as frequent accidents have occurred with such lifts due to persons travelling in them. As it is impossible to prevent factory employees and others from taking foolhardy risks in this way, although strictly forbidden, the firm thinks that the best precaution is to fit a safety device. Many of their factory lifts are situated outside in open steel-frame structures.

Of recent years automatic push-button lifts, worked without any attendant, have come greatly into favour. In these the door-locks are electrically worked. By opening the door the circuit is broken, the lift stops, and cannot start again till all the doors are closed. These automatic lifts have been brought to a very high state of perfection by Messrs. Flohr. They are of three different kinds:—(*a*) The simple button control operated from the cage only; (*b*) a button control for passenger lifts in private houses where either the porter or passenger works the lift; (*c*) a universal button control for passenger lifts. In this last the car, on leaving the floor, locks the door and travels to the desired landing and stops, unlocking the door automatically. The current is cut off as soon as the door is opened and the car cannot move until the door is closed again. On the outside of the shaft near the door are two buttons, one marked with the number of the floor, the other marked "ground floor," or with the name of the landing where the lift is intended to stand as a rule. By pressing the button marked with the particular floor the lift immediately goes up or down to take passengers from this floor. If the other button marked "ground floor" is pressed, as long as the lift is running electrically-lighted signs appear at all floors indicating that the lift is engaged. In the car there is an additional button marked "stop" which enables the passenger to stop immediately and change its direction. The Flohr automatic lifts have an arrangement which is distinctly an advantage. It very often happens that just as a passenger gets into the car and closes the door some person waiting at another floor presses a button, which locks all the other buttons, and the passenger is taken to the wrong floor. With the Flohr lift this cannot happen on account of a clever device which automatically disconnects the outside push button and so restricts its use to the person entering the cage.

The whole of the parts of the Flohr lifts are manufactured in the firm's workshops, including the steelwork and the metal grilles, often elaborate in detail, such as Fig. 1. Lifts are much more frequently used abroad than in this country, and Messrs. Flohr have had to build many special kinds of lifts which are particularly interesting to architects; as, for instance, Fig. 2, showing a hospital lift at the St. Marien Hospital, Düsseldorf. This lift has a special arrangement by which it stops very accurately level with the floor, so that a patient can be wheeled out without jolting. It has impervious washable surfaces so that there is no lodgment for dirt or germs. This lift is the result of many years of careful study, in which the wishes and demands of the highest medical authorities have been respected. These special lifts were installed by Messrs. Flohr in all the largest and most up-to-date hospitals in Germany.

There are many other points that Messrs. Flohr, with their great experience in this class of work, have made improvements upon. For instance, we are accustomed to see an ugly weight travelling up and down the shaft. At the small expense of a few feet of extra rope, the weight can be arranged to travel in a covered groove in the wall, so as to be out of sight.

A Central Reference Library for Westminster is proposed to be formed at Caxton Hall, to include the 40,000 volumes at present spread over the three branch establishments in Great Smith Street, Buckingham Palace Road, and St. Martin's Lane. Mr. John Murray, F.R.I.B.A., has been instructed to prepare a scheme and submit an estimate of cost for carrying out the alterations.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 1. Kendal.—*Additions and Alterations* to the Collin Croft Brewery for the Collin Croft Brewery Co., Ltd. Plans and specifications can be seen and further particulars obtained at the office of J. Stalker, M.S.A., architect, Kendal, to whom tenders (under cover) may be sent not later than Nov. 1.

Nov. 1. Surbiton.—(*1*)*Erecting a dwarf boundry wall* about 80ft. in length, in front of the Electricity Station, Ewell Road, Surbiton. (2) Providing and erecting 8ft. oak pale fence and gates, about 500ft. in length, on the east and north sides of the Electricity Station, Ewell Road, Surbiton, for the U.D C. Plans and specifications of the works can be seen on application to the Surveyor, District Council Offices, Surbiton. Tenders made out on the forms supplied, enclosed in sealed envelopes, endorsed "Tender for Wall (or fence) Electricity Station" as the case may be, must be delivered to E. J. Bell, deputy clerk to the Council, District Council Offices, Surbiton, on or before noon on Nov. 1.

Nov. 2. Leasingthorne.—*Rebuilding Shamrock Inn*, Leasingthorne, for the N.E. Breweries, Ltd. Plans, specifications, &c., may be seen at the Shamrock Inn. Tenders to be sent in to T. H. Murray, architect, Consett, on or before Nov. 2.

Nov. 2. Hull.—*Erection of three shops* in Jameson Street for the Property Committee. Drawings and specification may be seen of J. H. Hirst, city architect, Town Hall, Hull, and quantities obtained upon a deposit of £2 2s. Remittances to be made payable to the City Treasurer. Tenders, sealed and endorsed "Shops, Jameson Street," are to be addressed to the Chairman of the Property Committee, and delivered at the Town Clerk's Office, Hull, before 10 a.m. on Nov. 2.

Nov. 5. London, S.W.—*1. Erection of two shelters* in the playgrounds of the Special School, and alterations of playgrounds at the Queen's Road School. 2. Painting of railings round the Dundonald Road School. 3. Painting of external wood and ironwork of the old portion of the Queen's Road School, for the Borough Council of Wimbledon. A plan may be seen at, and specifications and form of tender obtained from, the Education Office, 12, Queen's Road, Wimbledon. Tenders must be delivered to A. Steele Sheldon, clerk, 12, Queen's Road, Wimbledon, by or before 12 noon on Nov. 5.

Nov. 5. Odiham.—*Alterations* at the Odiham Police Station. Persons desirous of tendering may see plan, specification, and conditions of contract, and obtain bills of quantities and all necessary information at the office of W. J. Taylor, county surveyor, the Castle, Winchester, on and after the 22nd Oct., between the hours of 9 a.m. and 5 p.m. (Saturdays 9 a.m. and 1 p.m.). A deposit of £2 2s. will be required for a copy of the bills of quantities. Deposits must be made by cheque payable to Hants County Council, and crossed "Bank of England," or particulars will not be sent. Tenders, endorsed "Proposed Alterations, Odiham Police Station," are to be delivered to H. Barber, clerk of the County Council, the Castle, Winchester, on or before Nov. 5.

Nov. 6. Low Greenriggs, Underbarrow.—*Renovating the farm buildings* at Low Greenriggs, Underbarrow, where plans and specifications can now be seen. Tenders to be sent to J. Bell, architect, Coniston, R.S.O., before 10 a.m. Nov. 6.

Nov. 6. Wicklow.—*Altering, enclosing and repairing 16 cottages* on the Wicklow Murrough, in accordance with a plan and specification prepared by the Town Surveyor, from whom all particulars can be obtained. Tenders endorsed "Murrough Cottages," to be addressed to the Chairman, and lodged with F. W. MacPhail, town clerk, Town Hall, Wicklow, not later than 10 a.m. on on Nov. 6. Parties tendering must enter into a bond for the due performance of the work.

Nov. 6. London, S.E.—*Alterations and additions to porter's lodge* of the Home for Aged Poor, Elder Road, West Norwood. Tenders, which will be received only on the printed form, sealed, and endorsed "Tender for Porter's Lodge, Norwood," must be sent by post on or before Nov. 6, addressed to W. Thurnall, clerk, Guardians' Board-room and Offices, Brook Street, Kennington Road, S.E., and will be opened in the Board-room at noon on the following day, when all persons tendering, or their authorised agents, must be in attendance. Drawings can be inspected at the architect's office, of E. C. Beaumont, 78, Fleet Street, E.C., between the hours of 3 and 5 p.m., any day but Saturdays, and specification and form of tender can be obtained at the office of the Clerk to the Guardians on personal application, and on receipt of a deposit of £2.

Nov. 8. Teignmouth.—*Erection of two barge flats*, to be used in carrying dredgings raised by their steam dredger, for the Harbour Commissioners. Particulars of dimensions, &c., to be obtained of E. J. F. Tozer, clerk to the Teignmouth Harbour Commissioners, Teignmouth, and tenders to be sent to him on or before Nov. 8.

Nov. 8. Manchester.—*Alterations and additions to Gorton Baths.*—Drawings may be seen, and specifications and bills of quantities obtained, at the office of the City Architect, Town Hall, upon payment of £1 1s. Sealed tenders, enclosed in the official envelope, to be delivered at the above office not later than 5 p.m. on Nov. 8.

Nov. 8. Cornforth.—*Erection of new butchering premises*, stabling, &c., at Old Cornforth, for the Cornforth Co-operative Society, Ltd. Plans, &c., may be inspected and bills of quantities obtained, on depositing £1, on application to H. T. Gradon, architect, Market Place, Durham, until Nov. 8, on which date properly endorsed tenders are to delivered to him.

Nov. 8. Maidstone.—*Taking down a portion of the old Bluecoat School*, in Knightrider Street, Maidstone, and erecting a new Baptist Church upon the site. Plans and specifications may be seen and bills of quantities obtained on application to Ruck and Smith, architects, 86 Week Street, Maidstone. Sealed tenders are to be delivered to them not later than 5 p.m. on Nov. 8.

Nov. 8. Carmarthen. *Conversion into offices* of Bank House. Spilman Street, Carmarthen, for the C.C. Tenders are invited from builders, painters, decorators, and furnishers. Copies of specifications may be obtained from the offices of the County Surveyor, King Street, Carmarthen, or of the County Education Architect, Shire Hall, Carmarthen. Tenders sealed and endorsed "Bank House Offices," are to be in the hands of J. W. Nicholas, clerk of the County Council, Shire Hall, Carmarthen, on or before Nov. 8.

Nov. 8. London, N.—*Supply of building materials and timber* till the 25th March, 1908, for the Guardians of the Poor of the Parish of St. Mary, Islington. Sealed tenders, endorsed "Tender for ——," and addressed to the Guardians, must be delivered to the Guardians' offices, St. John's Road, Upper Holloway, on or before November 7. Printed forms of tender, with conditions of contract and estimated quantities required, must be obtained from the clerk, as no others will be received. The tenders will be opened on November 8, at a meeting of the Guardians.

Nov. 10. Gerrans.—*Renovating the Wesleyan Chapel*, Gerrans. Specifications may be seen at Mr. Barnett's, chapel keeper, Gerrans. Endorsed tenders to be sent on or before Nov. 10, to J. Lobb, Pollaughan, Portscatho.

Nov. 10. Penzance.—*Erection of a wing* and other additions and alterations to the Riviera Palace Hotel, Penzance. The drawings and specification may be seen at the offices of O. Caldwell, F.R.I.B.A., architect, Victoria Square, Penzance. Sealed tenders, endorsed, "Tender for Riviera Palace Hotel," to be sent to the Secretary, Riviera Palace Hotel Co., Ltd,, 6, Clement's Inn, Strand, London, on or before Nov. 10.

Nov. 12. Belfast.—*Erection of new shops* and warehouse in Smithfield for Simpson & Mitchell, glass and colour merchants. Plans and specifications may be had of Thomas Houston, architect and civil engineer, King's Court, Wellington Place, Belfast. Plans and specifications may be had of him on or before Nov. 12.

Nov. 12. Blackburn.—*Demolition of the buildings* Nos. 116a and 116b, King Street, including the purchase and removal of the materials. Tenders, endorsed "Buildings, King Street," to be sent to L. Beard, town clerk, Town Hall, Blackburn, not later than 12 o'clock at noon on Nov. 12.

Nov. 12. Westham.—*Erection of a new public elementary school* for infants at Westham. Persons desirous of tendering are requested to send their names and addresses to F. J. Wood, county surveyor of East Sussex, County Hall, Lewes, on or before Nov. 12, from whom full particulars can be obtained.

Nov. 13. Southampton.—*Erection of a new Inland Revenue office* at Southampton. Drawings, specification, and a copy of the conditions and form of contract may be seen on application at the Collector's office, Inland Revenue, Southampton. Bills of quantities and forms of tender may be obtained at H.M. Office of Works on payment of £1 1s. Tenders must be delivered before 12 o'clock noon on Nov. 13, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Southampton Inland Revenue Office."

Nov. 14. Pontypridd. — *Erection of Park School*, Treforest, for the accommodation of 300 boys, 300 girls, and 300 infants, together with cookery and manual instruction centres. Plans and specification can be seen at the office of P. R. A. Willoughby, A.M.I.C.E., surveyor to the Council, and from whom bills of quantities can be obtained on payment of £3 3s. The bill of quantities must be sent in under seperate cover, with the name of the person tendering on the outside, under seal, to the Surveyor, and will be returned to him unopened in the event of his tender not being accepted. Tenders, on the prescribed form, to be sent under seal to D. Milton Jones, secretary, Municipal Buildings, Pontypridd, not later than Nov. 14.

Nov. 15. Tilbury.—*Erection of a police station* at Tilbury for the Standing Joint Committee of the Court of Quarter Session and C.C. of Essex. The drawings, specification, and form of contract may be inspected at the office of F. Whitmore, county architect, Duke Street, Chelmsford, between the hours of 10 and 5 o'clock on any working day except Saturday. Persons desirous of tendering must send in their names and addresses on or before Nov. 5, to the County Architect, enclosing a deposit of £5, in return for which a copy of the quantities and form of tender will be sent. The contractor will be required to give the bond of an approved guarantee society in the sum of £200 as security for the due performance of the contract. Bills of quantities and forms of tender can be obtained of the County Architect. Sealed tenders, endorsed "Tender Police Station, Tilbury," must be addressed to H. W. Gibson, Clerk of the Peace, Shire Hall, Chelmsford, and reach his office not later than Nov. 15.

Nov. 15. Helsington Laithes, Kendal.—*Erection of a residence* at Helsington Laithes, Kendal, for Mrs. Dixon. Tenders are invited in whole or separate trade contracts. Plans may be seen and quantities and specifications obtained at my office from November 1 to November 15, upon which latter date all tenders are to be sent (under cover) to J. F. Curwen, F.S.A., F.R.I.B.A., architect and sanitary engineer, 26, Highgate, Kendal, before noon. The whole to be subject to the ordinary conditions as by customs are established.

Nov. 23. Aldborough.—*Erection of Aldborough proposed new school.* Builders desirous of tendering should send in their names not later than Nov. 5, to C. J. Brown, architect, Cathedral Close, Norwich, at whose office plans and specifications can be inspected and bills of quantities obtained. A deposit of £1 1s. will be required. Tenders must be delivered by 12 noon on Nov. 23, addressed to "The Secretary, Norfolk Education Committee, 57, London Street, Norwich," and endorsed "Tender for Aldborough School."

Nov. 27. Fulwood.—*Erection of a new public elementary school*, to accommodate 162 children, at Fulwood, near Preston, for the Lancashire Education Committee. The plans may be seen and bills of quantities obtained at the office of H. Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before twelve o'clock noon on Nov. 27, sealed and endorsed, to J. W Lloyd, 4, Lune Street, Preston.

Nov. 27. Huncoat.—*Erection of a new public elementary school* to accommodate 300 children at Huncoat, near Accrington, for the Lancashire Education Committee. The plans may be seen and bills of quantities obtained at the office of H. Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on Nov. 27, sealed and endorsed, to F. Shutt, Council Offices, Mill Street, Padiham.

No date. Basford.—*Erection of new boiler-house, chimney, mortuary and piggeries* at the Workhouse of the Basford Union. Builders desirous of tendering may see the plans and obtain bill of quantities upon applying to W. V. Betts, architect, Bank Offices, Old Basford, Nottingham, and depositing a cheque for £2 2s.

No date. Exeter.—*Taking down the existing premises* and erecting a new block of buildings at the junction of High Street and Goldsmith Street, Exeter, for Messrs. Lennards, Limited. Plans and specifications may be seen at the offices of J. Crocker, F.R.I.B.A., architect and surveyor, 98, Queen Street, Exeter, and a copy of the bills of quantities, when ready, will be sent on receipt of a deposit cheque for £2 2s,

No date. Pinxton.—*Erection of new outbuildings* to the Pinxton Council Schools. Specification, &c., may be had on application to H. C. Taylor, architect, Pinxton.

ENGINEERING.

Nov. 1. Cork.—*Enclosing well* at Rochestown Wood for the R.D.C. Specifications may be inspected at the board room, Cork Workhouse. Each party tendering is required to give the names and addresses of two solvent sureties who are willing to enter into a bond for the due performance of the contract. Tenders will be received up to the hour of 12 o'clock noon of Nov. 1.

Nov. 1. Glasgow.—*Repair of the embankment* on the north side of the river Clyde between the boathouse near the Weir and the Humane Society's house for the Corporation. Plans may be seen and specifications and forms of tender obtained on application to A. B. M'Donald, city engineer, City Chambers, Cochrane Street; and sealed tenders, marked "Tender for Repair of River Embankment," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than 10 a.m. on Nov. 1.

Nov. 1. Cork.—*Sinking well and erecting pump* according to specifications at Inniscarra for the R.D.C. Each party tendering is required to give the names and addresses of two solvent sureties who are willing to enter into a bond for the due performance of the contract. Forms of tender can be obtained and specifications inspected at the board room, Cork Workhouse. Tenders on any other forms than those issued from this office will not be considered

Nov. 6. Stonehaven.—*Heating installation* for Kincardineshire Combination Poorhouse, Stonehaven, embracing boiler and heating plant, mason, carpenter, and plumber work, &c. Plans, specifications, schedule of quantities, and other information may be had from A. Stewart, 15, Leadside Road, Aberdeen, or J. Mitchell, clerk to the Board of Management, 25, Market Square, Stonehaven, with the latter of whom offers, marked "Tender for Heating," must be lodged not later than Nov. 6.

Nov. 9. Donaghadee.—*Sinking of a deep bore-hole* and for an alternative scheme of sinking a deep well in connection with the proposed new water supply for the town for the U.D.C. Stipulations, specifications, form of tender and schedule, and further particulars may be obtained at the offices of H. J. Weaver, C.E., F.G.S., engineer, Lipton Chambers, Gloucester, on deposit of £1 1s. Sealed tenders, endorsed "Waterworks," to be delivered to D. Walker, town clerk, Donaghadee, not later than 4 p.m. on Nov. 9.

Nov. 13. London. — *Reconstruction of the bridge* carrying Hampstead Road over the London and North-Western Railway, near Euston Station, in the borough of St. Pancras, in the Administrative County of London. Persons desiring to submit tenders may inspect the drawings and obtain the specifications, bills of quantities, form of tender, and other particulars upon application to the chief engineer, M. Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of the sum of £3. Full particulars may be obtained on application at the County Hall, Spring Gardens, previously to the payment of the fee for the specification, &c. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall in a sealed cover, addressed to "The Clerk of the London County Council, Spring Gardens, S.W.," and marked "Tender for Reconstruction of Bridge carrying Hampstead Road over the London and North-Western Railway." No tender will be received after 10 a.m. on Nov. 13.

Nov. 17.—Radcliffe.—*Construction of permanent way*, including copper bonding, of about 1½ miles of single line for the U.D.C. Drawings can be inspected and copies of general conditions of contract, specification, and bill of quantities obtained on application to W. L. Rothwell, engineer to the Council, on payment of a deposit of £2 2s. Sealed tenders, endorsed "Tramways Extension," must be delivered to S. Mills, clerk to the Council, Council Offices, Radcliffe, on or before Nov. 17.

Nov. 22. London, N.E.—*Supply of Specification No. 28.*—One 1,500-kilowatt steam dynamo and accessories. General conditions, specification, drawings, form of tender, and form of agreement may be inspected at the offices of R. Hammond, M.Inst.C.E., the consulting engineer to the Council, 64, Victoria Street, Westminster, S.W., and may be obtained there on making a deposit of £5. Extra copies of the specification may be obtained by bona fide tenderers at a charge of 5s. per copy, which sum will not be refunded. Tenders, sealed and marked "Tender for Steam Dynamo," must be addressed to W. A. Williams, at the Town Hall, Hackney, and be delivered on or before 4 p.m. on Nov. 22. Fair wages clause.

IRON AND STEEL.

Nov. 3. Durban, Natal.—*Supply and delivery "free on board"* of about 60 tons of 7-in. cast-iron pipes and special castings (from British ironfounders only) for the Corporation of Durban. Specifications can be obtained from W. H. Radford, C.E., Albion Chambers, Nottingham, consulting and representative engineer to the Corporation, on deposit of £1 1s. Sealed and endorsed tenders must be delivered to Webster, Steel & Co., agents to the Durban Corporation, 5, East India Avenue, Leadenhall Street, London, E.C., on or before Nov. 3.

Nov. 5. Bristol.—*Supply of* 30 cast-steel fairleads for the Docks Committee of the City and County of Bristol. Copies of the specification and copies of the contract drawing can be obtained from W. W. Squire, engineer, Engineer's Office, Cumberland Road, Bristol, on production of a receipt from the Secretary of the Docks Committee, showing that the sum of £1 has been paid as deposit. Tenders must be enclosed in a sealed envelope. endorsed "Tender for Fairlights," and addressed to the Secretary of the Docks Committee, 19, Queen Square, Bristol, and must be delivered to him, accompanied by the prescribed documents, before 10 a.m. on Nov. 5.

Nov. 5. London, E.C.—*Supply of steel rails*, fishplates, fishbolts and nuts, and wrought-iron spikes for the Board of Directors of the Bengal-Nagpur Railway Co., Ltd. Specifications and forms of tender can be obtained at the company's office, 132, Gresham House, Old Broad Street, E.C. For each specification a fee is charged, which will not be returned. Tenders to be delivered not later than noon Nov. 5th.

Nov. 10. Accrington.—*Supply of about 1,350 tons of steel tramway rails*, together with the necessary fish-plates, &c., for the tramway committee. Specifications, form of tender and other particulars may be obtained on application to the Borough Engineer, W. J. Newton, Assoc.M.Inst.C.E., Town Hall, Accrington, on payment of a deposit of £2 2s. Sealed tenders, endorsed "Tramway Rails," to be delivered at the office of A. H. Aitken, Town clerk, Town Hall, Accrington, not later than November 10th.

Nov. 13. London, S W.—*Supply of* (1) 1,200 pairs wheels and axles, (2) 20,000 steel sleepers and keys, for the Board of Directors of the Southern Mahratta Railway Co., Ltd., as per specifications and drawings, which may be seen at the Offices of the Company, 46, Queen Anne's Gate, S.W. The charge for each specification is £1 1s., which will not be returned. Tenders must be sent in addressed to the Secretary, marked "Tender for Wheels and Axles," or as the case may be, not later than 12 noon on Nov. 13.

PAINTING AND PLUMBING.

Nov. 5. Dublin.—*Painting of the roof* over the Exchange Platform of the G.N.R. (I.) and D.W. and W.R. Companies at Amiens Street, Dublin. Parties wishing to tender for the work can see the specification at the office of W. H. Mills, engineer-in-chief, Amiens Street Terminus, Dublin, or copy of same at the office of the District Engineer, G.N.R. (I.), Belfast, and forms of tender can be obtained at either of the above-mentioned places on payment of 1s. (not returnable) each. Tenders, made out on the forms supplied by the Company, and endorsed "Tender for Painting," should be delivered to T. Morrison, Secretary, Secretary's Office, Amiens Street Terminus, Dublin, not later than 10 a.m. on Nov. 5.

Nov. 6. Stockton-on-Tees.—*Painting and other work* at the Workhouse Hospital for the Guardians of the Stockton Union. Full particulars and forms of tender to be obtained from the Workhouse Master. Tenders (in covers, endorsed "Tender for Painting") to reach F. B. Watson, clerk to the Guardians, Stockton-on-Tees, not later than Nov. 6 at 12 noon.

Nov. 8. Barnstaple.—*Painting and repairing* the whole of the exterior parts of the Barnstaple Union Workhouse and Cottage Homes. Specifications of the required work may be seen on application to the Master of the Union Workhouse. Tenders, endorsed "Tenders for Painting," must be sent to W. H. Toller, clerk, Barnstaple, not later than Nov. 8.

ROADS AND CARTAGE.

Nov. 6. Mitcham.—*400 tons of hard blue Guernsey granite spalls*, for the Guardians of the Holborn Union, to be delivered in such quantities as may be ordered, free of all delivery charges and cartage to the Workhouse, Western Road, Mitcham, Surrey. The granite must be weighed as sent in, and the workhouse weighbridge weights charged for. Tenders (by letter) must be delivered to J. A. Battersby, clerk to the Guardians, Holborn Union Offices, 53, Clerkenwell Road, E.C., not later than 12 noon on Nov. 6.

Nov. 6. Lepton.—*Supply and delivery of a ten-ton steam-roller* and scarifier. Tenders may be sent not later than Nov. 6, to J. Sharp, clerk, Queen Street, Huddersfield.

Nov. 7. Twickenham.—*Forming, levelling, kerbing, channelling*, paving, metalling and making good the following streets within the district of Twickenham: Bridge Road, Broadway Avenue, Carnac Road, Laurel Avenue, Lebanon Park, Radnor Road, for the U.D.C. Plans can be seen and specifications and forms of tender obtained on application to F. W. Pearce, surveyor to the Council, Town Hall, Twickenham. No tender will be accepted unless made on the prescribed form. Sealed tenders, endorsed with the name of the street and marked "Tender for Street Improvement Works," to be delivered to H. J. Saunders, clerk to the Council, Town Hall, Twickenham, not later than 12 o'clock noon on Nov. 7.

No date. Cardiff.—*Construction of roads and sewers* on Heathfield Estate, Gabalfa, Cardiff. Plans and specifications may be seen and quantities obtained at the offices of E. Down, A.R.I.B.A., 31, High Street, Cardiff, on deposit of £2 2s.

SANITARY.

Nov. 3. Earsdon.—*Laying of an 18-in. outfall sewer*, for the R.D.C. The work in connection therewith comprises the following:—Furnishing and laying of 520 lineal yards or thereabouts of an 18in. cast-iron pipe and 2,703 lineal yards or thereabouts of an 18-in. earthenware pipe (this to include all necessary manholes, &c.). Full particulars, drawings and specification together with bills of quantities and forms of tender may be seen at the office of the Surveyor on personal application to J. R. MacMillen, Council Buildings, Shiremoor, between the hours of 9 and 10 a.m. and 4 and 5 p.m. on payment of a deposit of £3 3s. Sealed tenders, endorsed "Tender for Outfall Sewer" must be delivered to A. Dale, clerk to the Council, 85-86, Howard Street, North Shields, not later than Nov. 3.

Nov. 8. Monaghan.—*Covering sewerage purification tanks*, for the Joint Committee of the Monaghan Asylum, in accordance with plan and specification which may be seen at the board-room of the asylum between the hours of 10 a.m. and 5 p.m. Tenders to state the names of two solvent securities who will be prepared to enter into a bond conditioned for the due fulfilment and for the completion of the contract by such as the committee may determine. Tenders to be forwarded by registered post not later than Nov. 8.

Nov. 10. Swindon.—*Supply and delivery to the G.W.R. Station*, Swindon, of a cast-iron public urinal in accordance with the plan and particulars to be obtained on written application to H. J. Hamp, borough surveyor, Town Hall, Swindon. Tenders, endorsed "Public Urinal," to reach R. Hilton, town clerk, by 12 noon on Nov. 10.

Nov. 14. Leeds.—*Two slip sets of combined engines* and centrifugal pumps for pumping crude sewage from the main sewer into prepipitation tanks at Knostrop Sewage Works for the Sewerage Committee. Copies of drawing, conditions of contract and form of tender may be obtained at the office of G. A. Hart, engineer, Municipal Buildings, Leeds, on deposit of *bona fide* tender and all documents supplied to the tenderer. Tenders to be addressed to the Town Clerk, Town Hall, Leeds, and endorsed "Tender for Pumping Engines, Knostrop," not later than 10 a.m. on Nov. 14.

Nov. 19. Glasgow.—*Construction of Sewer No.* 6 (being a 3-ft. by 2-ft. brick sewer), extending along Dumbreck Road from Manor Road to Fleurs Avenue, a distance of about 825 lineal yards. Plans, specifications and working drawings may be seen, and specifications and schedule of quantities and forms obtained, on application to the City Engineer, City Chambers, 64, Cochrane Street, Glasgow, on payment of a fee of £5 5s. Sealed offers, marked outside "Tender for Sewer No. 6," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than Nov. 19. The resident engineer will meet intending offerers in Paisley Road, at Ibrox Station, at 11 on Nov. .

Dec. 19. Herne Bay.—*Construction of about 3¼ miles of brick* and concrete and pipe sewers, with all the necessary manholes, ventilators and flushing arrangements, the construction of a pumping station, cottage and buildings, and the provision of pumping machinery, for the U.D.C. Plans and specifications of the works may be seen and the form of tender obtained at the office of B. Latham, M.Inst.C.E., Parliament Mansions, Victoria Street, Westminster, the engineer for the works, or at the office or F. W. J. Palmer, the surveyor to the Council, at his office at Herne Bay. The quantities of the several works have been taken out by C. E. Bruges, A.M.I.C.E., 1, Victoria Street, Westminster, and may be had on application either to the engineer or surveyor on deposit of £10. Sealed tenders, on the form supplied attached to the quantities endorsed "Tender for Sewerage Works," are to be delivered at the office of J. Jubb, clerk to the Urban District Council, at Herne Bay on or before noon of Dec. 19.

Nov. 27. Jassy, Roumania.—*Water supply and sewerage* of the town of Jassy. All tenders to be in the Roumanian language, sealed, and to reach the Town Hall, by Nov. 27, at six p.m. The estimated cost of earthworks, subterranean galleries, iron mains from the source to the town, a distance of 91 kilometres, distribution and reservoirs in the town, also for sewerage, is 10,435,000 francs, and a loan of 13½ million francs has been effected to cover the cost. Payments will be made monthly in Roumanian money. Tenders for the whole of the work only will be considered. Necessary guarantee 420,000 francs. Plans and specifications may be seen, and all further information obtained of A. S. Savul, at the Chief Engineer's Office, Town Hall, Jassy.

No date. Chesterfield.—*Laying of new sidings, drainage*, and excavation work at Chatsworth Wagon Works, Chesterfield. Plans, &c., may be seen and bills of quantities obtained at the offices of W. Cecil Jackson, M.S.A., architect and surveyor, 29, Knifesmith Gate, Chesterfield, on depositing £1 1s.

TIMBER.

Nov 3. Dublin.—*Supply of the following stores* for 12 months from Jan. 1. to Dec. 31, 1907, for the Great Northern Railway Company (Ireland):—(38) timber scantlings for wagons and carriages (American white oak), (39) timber (logs, boards, planks, mouldings, sheetings, &c.). Forms of tender can be obtained from the secretary on payment of 1s. for each form. Tenders must be for the supply of goods in accordance with the company's patterns. These patterns may be seen at the General Stores Depot, Dundalk (they cannot be sent away for inspection), between 10 a.m. and 4 p.m., except on Saturdays, when they will not be on view after 12 noon. Tenders, made out on the company's forms, and endorsed "Tender for Stores," should be delivered to T. Morrison, secretary, Amiens Street Terminus, Dublin, by 10 a.m. on Nov. 3.

MISCELLANEOUS.

Nov. 5. London.—*Supply of brass and gunmetal goods*, gas and plumbers' fittings, cast-iron, electric fittings, cables, engineers' goods, wrought iron tubing, firewood, oak pales and posts, iron and steel, oils, tools and implements, and tramway car fittings, for one year from 1st Jan., 1907, for the L.C.C. Full particulars and also information as to the conditions to be observed by tenderers is given in the London County Council *Gazette*, of Oct. 22 (price 1d., post free 1½d.), which can be obtained from P. S. King & Son, 2 and 4, Great Smith Street, Westminster, S.W. Tenders must be upon the official forms, to be obtained on personal application or by sending a stamped addressed foolscap envelope to the Clerk of the Council, County Hall, Spring Gardens, S.W., and no tender will be received after 10 a.m. on Nov. 5.

Nov. 5. Glasgow.—*Supply of the following stores* for 12 months from Jan. 1, 1907, for the Directors of the Caledonian Railway Co.:—(2) bolts and nuts; (3) brick, clay and chimney cans; (17) colours and paints; (24) gas and water fittings; (24a) malleable iron pipes and fittings; (25) glass; (27) hammer shafts, &c.; (32) iron chain; (33) iron rivets; (34) galvanised wire, wire ropes, and wire fencing requisites; (40) locks; (41) nails sprigs and tacks: (49) screws; (52) spelter, tin and lead; (60a) electric lighting material and fittings; (73) cement, lime and slates. Specifications and forms of tender and any other necessary information may be obtained from J. Fergusson, stores superintendent, Caledonian Railway, Charles Street, St. Rollox, Glasgow. Patterns can be inspected till Nov. 2, from 9 a.m. till 5 p.m., at the company's stores, Charles Street, St. Rollox (Saturday, 9 a.m. till 1 p.m.), and all tenders must be to the company's samples and patterns. Tenders, endorsed "Tender for Stores," to be lodged with J. Blackburn, secretary, 302, Buchanan Street, Glasgow, not later than Nov. 5.

Nov. 6. Aldershot.—*Supply of Portland cement* for the year ending Dec. 31, 1907, for the U.D C. Specification may be seen and full particulars obtained on application at the Surveyor's Offices. Tenders, endorsed "Cement," to be sent to W. F. Foster, clerk, Municipal Buildings, Aldershot, on or before Nov. 6 next.

Nov. 7. St. Giles.—*Supply of earthenware and china* for the Guardians of the Poor of the Parish of St. Giles, Camberwell, to their several establishments, for the period from date of acceptance of tender to Oct. 5, 1907. Persons desirous of tendering can obtain forms for the purpose, containing further particulars, upon application to S. Stevens, clerk to the Guardians, Guardians' Offices, 29, Peckham Road, S.E., and tenders must be delivered to the Guardians' Office, sealed and addressed to the Board of Guardians, marked "Tender for ——," before 12 noon on Nov. 7.

Nov. 19. Dublin.—*Supply of the following stores* for the Directors of the Midland Great Western Railway of Ireland Company. The contracts to commence from Jan. 1 next, and terminate on Dec. 31, 1907:—(4) brass and copper tubes, plates sheets, &c.; (5) brass cocks and gas fittings; (6) bricks, flags, tiles, &c.; (11) cements; (13) copper, tin (ingots), lead, gun-barrel, &c.; (15) glass; (17) iron castings; (18) do. Staffordshire bars, plates, wires, &c.; (19) do. Yorkshire do.; (20) ironmongery; (26) springs, steel and files; (27) steel tyres, axles and plates; (28) timber, &c. Forms of tender can be obtained, on payment of 6d. each, from the Storekeeper, General Stores Department, Broadstone Station, Dublin. Patterns and samples can be inspected at the same place on and after Nov. 1, between the hours of 10 a.m. and 4 p.m., except Saturdays. Contractors cannot be allowed to tender to supply goods to their own patterns, nor can the company's patterns be sent away for inspection. The directors will not consider any tender unless furnished on the company's forms; nor any tender in which any alteration of the form has been made. The tenders to be sent in by post, sealed and endorsed on the envelope, "Tender for Stores, Form No. ....," and addressed to "The Chairman, Broadstone Station, Dublin," so as to reach him on or before 10 a m. on Nov. 19.

Nov. 26. London.—*Supply during 1907 of the following stores* for the L.G. Omnibus Company, Ltd.:—(a) timber; (b) ironmongery, coachmakers', engineers', saddlers', and farriers'; (e) oil, glass, grease and sundries; (k) building materials; (l) gas and water fittings; (m) enamelled iron plates. The schedules will be ready Nov. 12, and may be obtained at the company's coach factory, North Road, Caledonian Road, N., on payment of 2s. 6d. each, where samples also will be on view Nov. 14, 15 and 16, between the hours of 10 a.m. and 5 p.m. Contractors are requested to call and examine the samples before tendering. Sealed tenders, endorsed "Tender for Stores," should be addressed to the Directors, 6, Finsbury Square, E.C., not later than noon, Nov. 26.

TOO LATE FOR CLASSIFICATION.

No date. Salisbury.—*Alterations and additions to No. 13, Catherine Street*, for Messrs. Eldridge and Young. Plans and specifications can be seen at the offices of J. Harding and Son, architects and surveyors, 58, High Street, Salisbury.

Nov. 2. Aber 'een.—*Proposed additions to Straloch House.* Estimates are wanted for the mason, carpenter, slater, and wood panelling works. Plans and specifications may be seen with the gardener or with G. B. Mitchell, architect, 148, Union Street, Aberdeen, with whom offers are to be lodged on or before Nov. 2.

Nov. 13. Yatton.—*Providing and laying* about 7½ miles of cast-iron mains, varying from 2ins. to 6ins. in diameter, and also 1,100 yards of 1½in. galvanised wrought-iron tubing, together with valves and hydrants, and the construction of a concrete and brick service reservoir, to contain 150,000 gallons, for the Long Ashton R,D.C. in accordance with plans and specification prepared by A. P. I. Cotterell, M.Inst.C.E., engineer, 28. Baldwin Street, Bristol. The plans may be seen at his office during usual office hours. Copies of the specification, form of tender, and bill of quantities may be obtained from the engineer by intending contractors on payment of the sum of £3 3s. Tenders on the forms provided must be delivered to A. E. Hicks, clerk, Union Offices, Flax Bourton, near Bristol, under seal, and endorsed "Tender for Yatton Water Supply—Contract 2," at or before 10 a.m. on Nov. 13

Nov. 28. Glanyrafonddu, near Tally.—*Erection of stone and steel bridge* at Glanyrafonddu, near Tally, Llandilo, for the Carmarthenshire C.C. Plans may be seen, at and copies of specification and quantities obtained from,the offices of C. H. Mounsey, county engineer and surveyor, County Surveyor's Offices, Carmarthen, on and after Nov. 7. Sealed tenders are to be in the hands of J. W. Nicholas, clerk of the C.C., Shire Hall, Carmarthen, on or before Nov. 28.

No date. Hunstanton.—*Alterations and additions to shop* at Hunstanton. Also for the erection and completion of a new warehouse on a site situated in Guanock Terrace, Lynn. Plans, &c., and other particulars can be seen at the offices of W. Jarvis and Son, architects, Paradise Parade, King's Lynn, to whom builders desirous of tendering should send in their names at once.

New London Buildings

At yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:

Formation of certain new streets for carriage traffic on the Streatham Lodge estate, Streatham Common (south), Wandsworth. (*Modification of resolution.*)

Angle turret to a proposed building at the corner of Melbury Road and Holland Park Road, Kensington, on the application of C. J. C. Pawley. (*Consent.*)

Projecting balcony in front of a proposed block of buildings between Nos. 18 and 20, Cavendish Square, St. Marylebone, on the application of Gilbert & Constanduros. (*Consent.*)

Two bay windows in front of No. 11, Grafton Street, Old Bond Street, on the application of W. Woodward, on behalf of B. Quaritch. (*Consent.*)

Stone balcony in front of No. 13, New Burlington Street, Regent Street, on the application of A. E. Hughes and Son, on behalf of D. C. Apperly. (*Consent*).

Wooden balconies in front of Nos. 16 and 17, Glenesk Road, Eltham, on the application of D. Warry, on behalf of G. Van Gyseghem and himself. (*Consent.*)

Bay windows to seven houses upon the southern side of Godfrey Hill, Woolwich, between Godfrey Street and Lower Wood Street, on the application of S. A. Douglass. (*Consent.*)

One-storey building at the flank of No. 296, Queen's Road, Deptford, to abut upon Erlanger Road, on the application of A. D. Johnson, on behalf of M. H. Glover. (*Refusal.*)

Two houses on the northern side and two houses on the southern side of Bargery Road, and two houses on the northern side of Inchmery Road, Catford, with the flanks of three of such houses abutting upon Penerley Road, on the application of Norfolk & Prior, on behalf of J. Watt. (*Refusal.*)

Building on the south-western side of Thornsbeach Road, Catford, with the flank of such building abutting upon Bargery Road, on the application of Norfolk & Prior, on behalf of J. Watt. (*Refusal.*)

Retention of a forecourt wall and the erection of a fence on the eastern side of Plassey Road, Catford, along the western side of the yard belonging to the premises marked "house and shop," the wall and fence being at less than the prescribed distance from the centre of the roadway of Plassey Road, on the application of T. Buckland. (*Consent.*)

Projecting shop front on the King Street frontage of a proposed addition to Nos. 95 and 97, High Road, Kensington, on the application of Pilditch & Co., on behalf of J. Barker & Co., Ltd. (*Refusal.*)

Building on the eastern side of Great Chapel Street, Westminster, to abut also upon Dacre Street, on the application of Griffin & Woollard, on behalf of the Westminster Trust, Ltd. (*Consent.*)

Proposed addition to Nos. 95 and 97, High Street, Kensington, to abut upon King Street and Ball Street, and to exceed in height the width of Ball Street, on the application of P. E. Pilditch, on behalf of J. Barker and Co., Ltd. (*Consent.*)

Pump-house at the Grove Road Generating Station, Grove Road, St. Marylebone, on the application of C. S. Peach, on behalf of the Central Electric Supply Co., Ltd. (*Consent.*)

The Theatres and Music Halls Committee reported the following applications:—

Drawings submitted by the Charing Cross, West End and City Electric Supply Co., Ltd., showing a proposal to fix electric heaters at the Comedy Theatre, Panton Street, Haymarket. (*Consent.*)

Drawings submitted by Joseph & Smithem, of a concert hall to be erected on the site of St. Paul's Church, Great Portland Street. Accommodation is shown for about 750 persons in the body of the hall and for about 484 in the gallery. (*Consent.*)

Drawing submitted by J. M. Klempner, of the Imperial Restaurant, No. 20. Shepherds Bush Green, with a view to obtaining a music licence for the restaurant on the ground floor. (*Consent.*)

Drawings submitted by Skewes-Cox, Nash & Co., of the Old Swan Public House, Battersea. (*Consent.*)

Drawing submitted by F. W. Hingston, showing the gates which it is proposed to fix at the east and west ends of the 20ft. passag -way at the Putney Hippodrome, Felsham Road, Putney. (*Consent.*)

Drawing submitted by R. Dawson, Ltd., showing the connections of the main switchboards and distribution boards of the electrical installation at the Putney Hippodrome, Felsham Road, Putney. (*Consent.*)

Drawings submitted by Alexander Ritchie & Co., showing the heating apparatus proposed to be installed at the Queen's Music Hall, Poplar. (*Consent.*)

MINERVA PAINT
FOR DECORATORS.

There are two things about Minerva Paint that you ought to know.

First: It is Purity itself perfectly mixed. You know it as well as you know your own hand-mixed paint, because every can carries a signed Guarantee specifying ingredients in detail.

Look for that Guarantee on the lid. It saves you worrying about quality. You know the mixing is right!

Pure materials properly mixed—Perfect Paint.

Educational—*continued.*

STRUCTURAL STEELWORK

Can you Design your own Steelwork? Do you know how to properly proportion your columns, stanchions, and girders? We guarantee to teach you how to do this in a few lessons by our System of Correspondence Tuition in Architectural Steelwork.—Apply to us for free Booklet J (4th edition), MIDLAND ENGINEERING BUREAU, Strand, Derby.

PRACTICAL DESIGNING of STEEL CONSTRUCTIONAL WORK taught by Correspondence, individually or in classes. Elementary and advanced courses arranged for Architects, Engineers, &c. Write for Prospectus B., EMBANKMENT ENGINEERING INSTITUTE, 156, Temple Chambers, Temple Avenue, E.C.

The "Builders' Journal" Employment Register

offers you exceptional facilities for making your requirements widely known.

Those who have used our columns when advertising for fresh berths have expressed the greatest satisfaction at the results they have obtained, and we append a letter received recently from one of them:—

> "Kindly remove my name from your Employment Register. I am glad to say I have obtained a berth through its agency, for which I am obliged to you."

Every week—we might say every day—we get fresh evidence that employer consult the "Builders' Journal" Employment Register, and appended are a selection from the letters received during the last few days.

A large firm of Builders' Merchants write:

> "Referring to the 'Builders' Journal' Employment Register, will you ask No. 1585 to send us particulars of experience, salary required, &c."

A well-known F.R.I.B.A. writes:

> "Kindly put me into communication with your advertiser, No. 1637, as soon as possible."

A large firm of provincial Architects write:

> "Can you put the following advertisers into communication with us: 1649, 1652, 1654, 1660, 1681 and 1712, and oblige."

The above letters speak for themselves, and it only remains for you to give the Employment Register a trial, and below we give full particulars of the cost of making your requirements known.

For 3s. we give three insertions (four lines) in our "Appts. Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page xx).

TO ARCHITECTS.

T. H. BATSTONE *begs to thank his numerous clients for their generous support and patronage, and desires to make it generally known to London and Country architects that he has no connection with any other firm whatever but the one undermentioned, where all communications will :: :: receive his prompt and personal attention. :: ::*

Messrs. Aldam Heaton & Co., Ltd.,
ECCLESIASTICAL DECORATORS
28 & 29, Baker Street, Portman Sq., London, W.

BUILDER'S and ESTIMATOR'S ASSISTANT (20); 4 years' exp.; quantities and construction certificates; drawing, tracing, &c., and office routine; excellent refs.; salary low.—Box 2173, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER'S CLERK and ASSISTANT (23), with seven years' general experience, desires situation; competent to supervise outside work assist estimating, etc.; used to p.c. accounts and usual routine. —TOWNSEND, 13, Ripon Street, Aylesbury. 2157

BUILDER'S FOREMAN (outdoors) seeks engagement. Well up in plans, specifications, estimating, &c.; has had entire charge of works; thoroughly practical; excellent references; age 45.—R. TURNER, Adlestrop, Chipping Norton. 2131

CLERK OF WORKS (32) shortly at liberty to accept APPOINTMENT at Home or Abroad; at present engaged upon extensive alterations and additions to Government works; 18 years' practical and varied experience. Draughtsman; total abstainer; thoroughly reliable; highest references.—Apply Box 2111, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

CLERK OF WORKS; large and varied experience, thorough knowledge, labour, material and construction; leveller, draughtsman, and keen supervisor; at liberty.—J.M., 77, Welbourne Road, Tottenham. 2163

CLERK OF WORKS or ARCHITECTS' ASSISTANT shortly disengaged; 9 years' exp.; good draughtsman, details; perspectives, surveying and levelling; good references; practical knowledge; used to library and hospital work; salary, from £2.—Box 2176, BUILDERS' JOURNAL OFFICE, 6, Great New Street, London, E.C.

CONTRACTOR'S AGENT or ASSISTANT seeks POSITION in office or works. Eleven years' experience, roads, sewers and buildings; home or abroad.—S., 2 Douglas Road, Lewisham. 2106

FOREMAN MASON desires RE-ENGAGEMENT; just finishing church job; abstainer; good knowledge of machinery; first class references and qualifications.—Box 2103, BUILDERS' JOURNAL Office, 6, Great New Street, London, E.C.

GENERAL FOREMAN (36) seeks RE-ENGAGEMENT. Well up in plans and measuring. With last employer 13 years on London jobs. Highest references. W., 77, Ardgowan Road, Catford. 2082

GENERAL FOREMAN seeks SITUATION new or alterations Carpenter and Joiner; age 46; abstainer; energetic, trustworthy, and practical in all branches; good reference.—Address, E. A. H., 130, Purves Road, Willesden. 2159

GENERAL FOREMAN; experienced, pushful, and keen in supervision; just completed well known City job; undeniable references.—A.B., 215, Upper Thames Street, E.C. 2162

GENERAL FOREMAN; capacity reliability · references from all employers from apprenticeship, including present employer and seven years with last.—G. A. GREEN, 112, Fulbourne Road, Forest Road, Walthamstow 2164

JUNIOR ASSISTANT seeks ENGAGEMENT. Diligent, reliable, highest references, good draughtsman. penman, colourist, tracer, &c.; measure up old buildings, assist with quantities.—P. H., 69, Allison Road, Harringay, N. 2125

MONUMENTAL MASON (24) seeks situation; letter-cutting, writing and gilding. stone or marble. Practical knowledge stone painting; good refs.; 8 years present berth.—Box 2146, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

PAINTER, GLAZIER, good rough carpenter, &c.; age 32; 14 years' experience; good refs.; builder, estate, factory, &c., anywhere; moderate wage.—H. D., 1, Rackham Street. North Kensington. 2123

PAINTER AND GRAINER (good) wants job; good West End experience as foreman of painters; total abstainer.—Apply, GRAINER, 1, Milner Villas, Bonner Hill Road, Kingston, Surrey. 2119

PAINTER (good) requires WORK; young man, age 27; town or country; used to all classes of work; abstainer; state wages.—A.W.P., 19, Chesterfield Gardens, Harringay, Middlesex. 2175

QUANTITY SURVEYOR'S ASSISTANT (22) desires ENGAGEMENT; 6 years' London experience working up and taking off; temporary or otherwise; London or Provinces; salary moderate.—Box 2165, BUILDERS' JOURNAL.

QUANTITY SURVEYOR'S ASSISTANT (21) desires RE-ENGAGEMENT, temporary or permanent; 5 years' experience; abstracting and billing; good references.—C., 3, Ballock Road, Dowanhill Road, Catford, S.E.

SHOP FOREMAN of Joiners seeks re-engagement; 8 years' experience as foreman; accurate setter-out; well up in machinery; good manager of men; first-class references.—Address, Box 2139, BUILDERS' JOURNAL Office, 6 Great New Street, Fetter Lane, E.C.

TO QUANTITY SURVEYORS.—Assistant (30); quick, reliable, good London experience, taking off, measuring-up, expert worker-up, &c. Temporary or permanent; terms moderate.—Box 2169, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Drawings, Tracings &c.

AN ARTIST and DRAUGHTSMAN is prepared to undertake Architectural Drawings or Designs for manufacturing firms, either in office or at home. Perspectives, Illuminated Addresses, &c.—E.S.B., Box 1813, BUILDERS' JOURNAL Office, 6 Great New Street, Fetter Lane, E.C.

ARCHITECT & SURVEYOR (Qualified), very capable, with good central city offices, would like to take up work on moderate terms. Designs, steel constructions, quantities, dilapidations. Applications to L.C.C. estate work. Telephone. Box 2150 BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARTISTIC WATER COLOUR PERSPECTIVES, Architectural Drawing and Typewriting at moderate charges, by Aubrey Pritchard, The Grove, Rhyl. 2130

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

DRAWINGS from rough Sketches, Designs, Details, Specifications, Drain Plans and Quantities Prepared; terms moderate.—J. W., 8, Rylett Crescent, Shepherd's Bush, W. 2101

DRAWINGS prepared for Architects, Surveyors, &c.; sketch plans, working drawings, details coloured and finished complete. Specimens produced if desired. Terms 1s. per hour or by agreement.—MAC, 190, Alexandra Road, St. John's Wood, N.W. 2177

PLANS, SPECIFICATIONS and QUANTITIES prepared from sketches and notes.
RICHARD M. GEATER,
18, Prince of Wales Road, Norwich.

QUANTITIES AND SPECIFICATIONS ESTIMATES. (Nominal fee if unsuccessful). Experienced General Assistance, Competitions, Designs, Contract, Detail, and Working Drawings—Address, QUANTITY SURVEYORS, 21, Liverpool Street, E.C.

TRACINGS EXECUTED by first-class worker.—Box. No. 2110, BUILDERS' JOURNAL Office, 6, Great New Street, London, E.C.

Appointments Vacant.

GENERAL FOREMAN WANTED for first-class country job in Herts. Must furnish undeniable references. Employer will ask for personal interview with previous employers.—Apply Box 2171, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

LONDON AGENT WANTED, calling upon Builder's Merchants in London and district, to push Fireclay goods of highest quality on commission; no risk involved, but good references required and given by very old established firm.—Apply Box 2113, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

REINFORCED CONCRETE. — Wanted practical explanations of design, and calculations from experienced draughtsman; state terms.—M., 25, Highfield Grove, Rockferry.

TRAVELLERS, with coanection amongst Architects, Local Government Authorities, and Corporations, are offered excellent side lines in Enamels, Varnishes, Paints, &c. Liberal commission—Box 2156, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Businesses Wanted & For Sale

BLUE LIAS LIME WORKS (4 Acres) FOR SALE. Capable output 175-200 tons per week; only reason for selling owner going abroad: good business connection; price, including buildings and plant, £2,500; freehold.—Apply Burnett & Sons, Agents, Southampton.

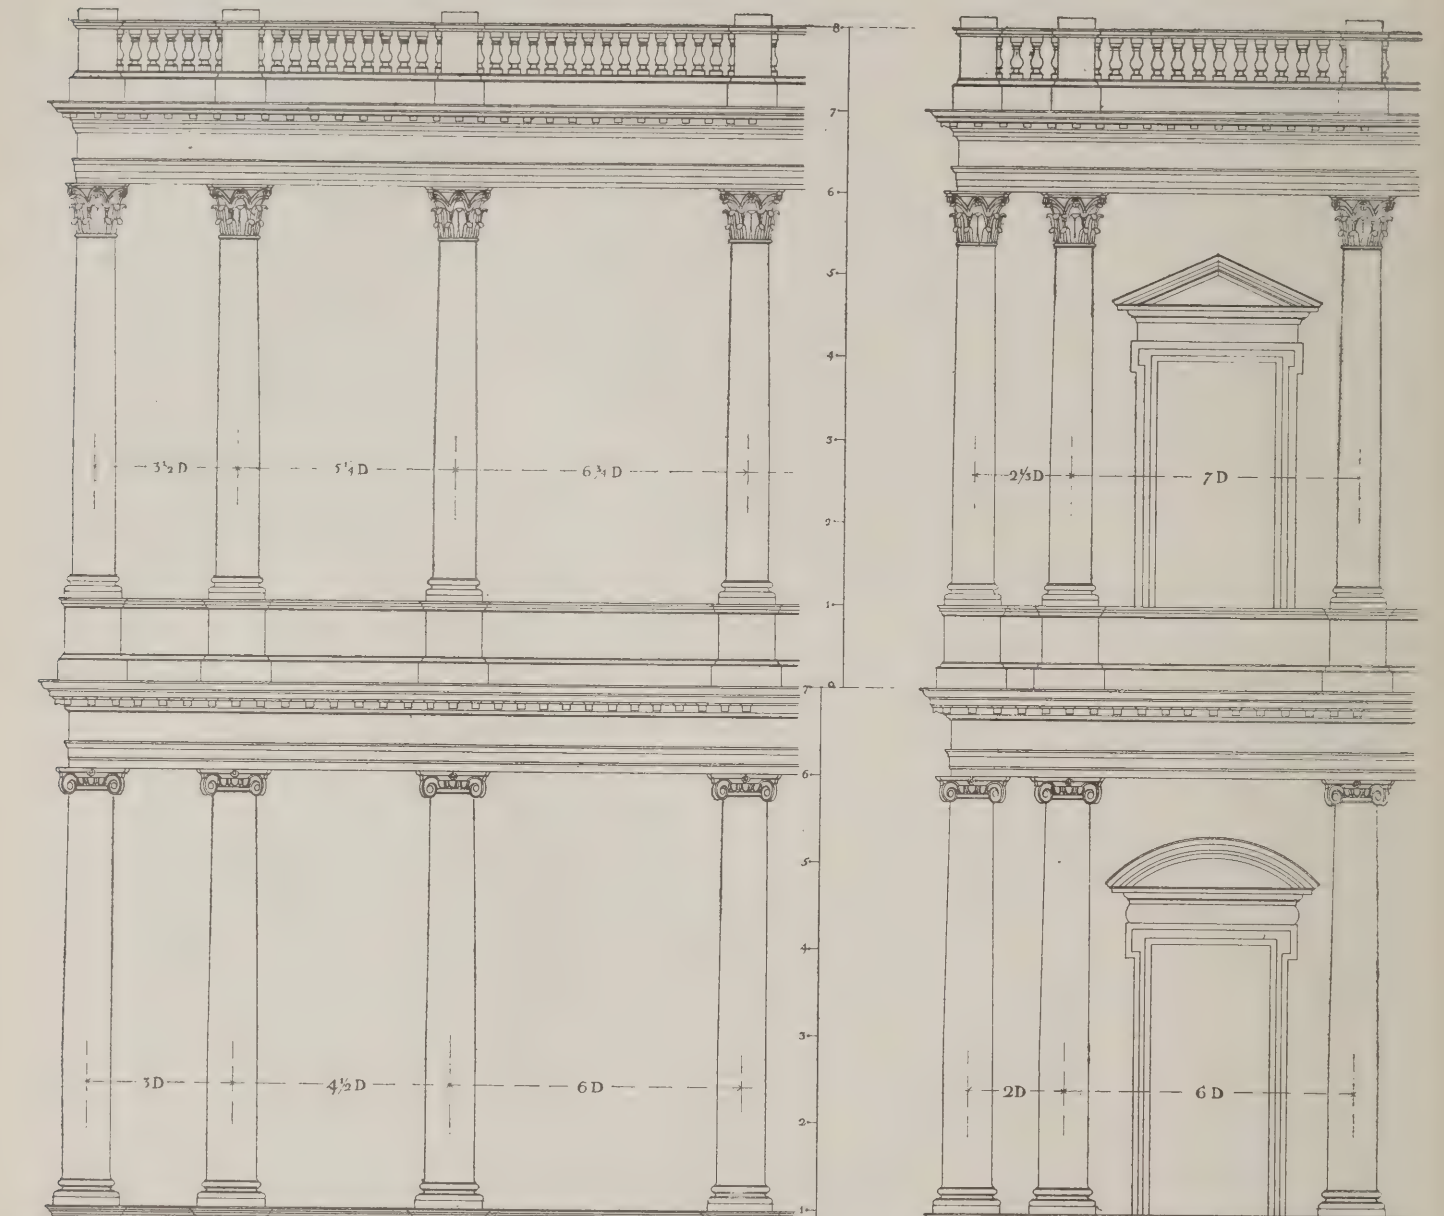
Archaeological Architecture. We are accustomed to see architecture dealt with from two standpoints, namely, the archæological and the standpoint of to-day. It is seldom that experts are authorities in both schools of thought. Not many years ago architecture was dominated by the archæological school, who endeavoured to found architectural design upon the canons of the past, and all their investigation of existing examples of ancient architecture was designed to establish such canons. We have travelled a good way since then, and although our architectural students are required to study histories of architecture (generally compiled by the aforementioned archæological purists), their chief concern now seems to be to acquire a working knowledge of building construction and of English Renaissance architecture. The study of English Gothic is confined to very narrow limits. The Italian Renaissance attracts more attention. The majority of architects in this country, however, seem chiefly to study modern work, and the perpetration of forms which are fashionable. There is very little attempt to study construction and form together, so as to trace their relation and to alter and advance on the recognised canons in view of modern constructional methods and materials. The reason for the present indifference and want of uniformity is no doubt traceable in great part to the fact that the study of ancient architecture has been left in the hands of architects largely divorced from practice and mostly interested in what might be termed pure archæology. There is a small section of the architectural public interested in such antiquarian investigation, but generally the profession remains unstirred. A very few architects have endeavoured of late to treat the history of architecture in a way more instructive to the student proposing to practice as an architect. The French may be held to have been the pioneers in this direction; Viollet le Duc and Choisy, for instance. The paper which was read before the Architectural Association last Friday by Mr. Hugh Stannus conformed to this modern method of dealing with archæological facts. He endeavoured to account for the reasons for the forms adopted by imagining the means by which building operations and architectural design would have been carried out in the days in which they were produced. Even if too great a use of the imagination may result in the production of theories that are subject to very destructive criticism, yet it undoubtedly does great service in calling the attention of architects to fundamental principles which should be studied in the use of these same forms to-day, and to features which require modification. It is very difficult for us to reconstruct the methods by which building operations were carried on in past civilisations, for so many facts are missing. The imaginative study of canonical forms, such as the Orders, therefore, very often results in details being ascribed solely to influences which are obviously minor ones, or which must have been governed to a great extent by other influences of greater or less importance. It is here where this new archæological method often fails, because the exponents are out of touch with practical construction, and betray a want of common-sense in dealing with building methods. It is plain that if any particular forms took many years to crystallise they could not have sprung into being in defiance of easier and more natural ways of meeting the requirements. The theorist either supposes ancient builders were far behind the general culture of the age in which they lived and did not know the simplest means of getting at the desired result, or else that they had a mystical knowledge of principles which we have lost, or commanded resources not at our command. Either view is extreme. It is absurd to suggest that any particular feature was designed to serve some mysterious or amateurish need.

An Edinburgh Improvement. A proposal has been made to widen Edinburgh's famous Princes Street so as to improve its appearance, and the Town Council have thought it worth while to go to some little expense in order that the public might be able to pass an opinion upon the advisability of the proposal. Consequently £50 has been spent on a model of a portion of the solid retaining wall necessary for the extended promenade. This model has been erected in Princes Street Gardens. It is made of wood and canvas, painted a light grey colour to resemble stone, and measures 24ft. to the top of the parapet. The suggested wall is divided into panels by massive pilasters 18ft. apart, and every third panel is intended to contain a shelter. The expense which the Council have incurred in erecting this model is being criticised, the opinion being expressed that a better opinion could have been obtained from a properly prepared perspective drawing, and that the incomplete model (only three bays long) neither shows how the wall is to be treated at the end, nor how entrances are to be formed. It is suggested that the proposed retaining wall is too high as viewed from the gardens, and that it could be lowered with advantage several feet by making a few steps from the present street level down to the proposed promenade, which is 45ft. wide. Indeed, by sloping the pavement from the present level several feet of this height could be saved. The cost of this proposed promenade is estimated at about £15,000. The effect of erecting such a wall would be that the green bank of ivy now existing would have to be abolished. The lower trees and shrubs on the green bank would have to be sacrificed; the upper line of the trees would be preserved and rise through gratings in the concrete. It has been suggested that if such a scheme is carried out it would be well if two semi-circular projections were formed in the wall so as to give spaces in their centres for statues, while steps would descend to the gardens on either side. Any proposal to rob space from Princes Street Gardens needs careful consideration, because the fatal error of permitting the railway to run through the centre of these gardens, and later to be widened up to the very foot of the Castle Rock, has already robbed them of most of the beauty they would otherwise have possessed.

PLATE 6

ORDER VPON ORDER & INTERCOLVMNIATIO



THE ORDERS AND THEIR APPLICATION. BY ALFRED W. S. CROSS, M.A., F.R.I.B.A., AND ALAN E. MUNBY, M.A.

PRACTICAL NOTES FOR ARCHITECTURAL DRAUGHTSMEN.

By Alfred W. S. Cross, M.A., F.R.I.B.A., and Alan E. Munby, M.A.

THE ORDERS AND THEIR APPLICATION.

(Continued from p. 200, No. 611.)

Plate VI.

When horizontal and vertical spacing have to be considered together, complications—additional to those referred to in Plate IV. on arcading—necessarily occur, and it is usually impossible, in practice, to decide the distance between columns from a purely academic point of view. The use of coupled columns is often of great assistance in difficult problems of intercolumniation, and such columns should be so spaced that their capitals are almost in contact. Columns thus arranged in pairs are also effective when placed at external angles, where they give an appearance of strength to the building and finish to the façade. The intercolumniation throughout is fixed by that adopted for the lowest Order, since the columns of the upper storeys must lie upon the same central lines. Where different Orders are used, the intercolumniation must thus vary in each storey (being based upon the diameter of the column); but, however far from the ideal the resultant spacing may be, all openings should have a greater height than width. Naturally the Tuscan should be used for the lowest storey, and the Doric, Ionic and Corinthian Orders for the upper stages of the building, whereby the composition becomes lighter in character as its height increases. If the same diameter of column be used throughout, the storeys will increase in height from the ground upwards, giving a result which is not only unsatisfactory in appearance, but incompatible with the usual horizontal accentuations of a structure. The best rule to follow is that devised by Scamozzi and adopted by Gibbs—namely, to make the upper diameter of the lowest column the lower diameter of the one next above, continuing this diminution to the top of the building.

Pedestals are most suitable for use with the Orders when they are connected by a balustrade or blocking course, or when the columns are engaged; but, as a rule, they should be avoided in the higher storeys, as they tend to produce a heavy effect; their introduction, however, is sometimes necessary, as, for instance, in cases where the distance between the floor and ceiling line makes it difficult to proportion the Orders properly by the above rule; in such cases pedestals are often found useful. It is not always possible to retain the height given for the pedestal—namely, one-fifth of the total height of the Order—when it is used in this manner. For example, the sills of windows cannot usually be well placed below the cap of the pedestal; therefore, in cases in which the rooms are to be used for ordinary domestic purposes, consideration for the comfort of the occupants of the building will usually necessitate a smaller pedestal height being adopted.

If the lowest storey of the building be rusticated, the size of the stones must be proportionate to the rest of the composition; and if a cornice crown this rusticated storey, its height should be about one eighteenth of that of the storey, while the height of the plinth terminating the base may be about one-ninth.

The height of a crowning balustrade, if used, should be one-quarter to one-third the height of the storey below, and its plinth should be increased in height in proportion to its concealment, by the top cornice, from an observer's most advantageous point of view.

When intercolumniations are wide, and when lightness is particularly required, the entablature of the Orders may be slightly reduced in height, the relative proportions of their members being still retained. It need hardly be added that these and other horizontal features, such as strings and balustrades, should be continuous throughout a façade, as otherwise the dignity, continuity and repose of the elevation may be entirely destroyed.

(To be continued.)

THE ARCHITECTURAL ASSOCIATION.

Mr. Stannus on the Corinthian Capital.

Mr. Hugh Stannus delivered a most interesting lecture on the Corinthian Capital before the Architectural Association on Friday evening last. The paper was illustrated with a large number of diagrams and lantern slides, without which we regret it is impossible to give an adequate report; but the following is an abstract:—

Mr. Stannus first defined the Corinthian Capital, showing its constructive function and its æsthetic value. In Corinthian examples the essential elements were the calyx—*i.e.*, the leaf-band at the starting—and the major cauliculus —*i.e.*, the corner-scroll under the abacus at the top. Without these a capital might be Corinthianesque or semi-Corinthian; but it could not be considered as a complete or perfect example of the style.

Mr. Stannus explained the origin of the name, it having been adopted because the ornamental parts of the early capitals were made of bronze from the ancient city of Corinthos. He then showed views of Roman remains in which the capital was bare, the ornamental leaves having been removed; and directed attention to the holes of the rivets with which they had been originally fixed.

The evolution

he traced from the Egyptian papyrus-flower capitals to a (theoretical) early example of the Aiolou type. Then, explaining his reasons for believing that the capital figured in Prof. Cockerell's book on Bassai was not a portion of the architecture of the temple, but only the capital of a statue-pedestal, he suggested the date of it as about 380 B.C., judging by the details shown in Cockerell's drawing. He demonstrated the gradual building-up of this capital with bronze scrolls and leafage-ornaments, thus proving that it was the simplest and therefore the earliest example of which there was any pictorial record; and, further, that it was undoubtedly derived from a bronze original. The date of the succeeding type, from Epidauros, he accepted as 374 B.C.; and from internal evidence he showed that it was later than the Bassai type, though containing equally strong evidence of a bronze original, and also traces of Ionian influence. The Miletos type he placed at about 360 B.C.

Mr. Stannus mentioned the Choragic-column type, which shows traces of Phœnician influence; and, further, he proceeded to explain and criticise the Lysicrates type of 335 B.C. There must have been intermediate steps between this date and the time of Antiochos IV.; but he did not know of any existing examples.

The Olympian type of 174 B.C. shows a severe and orderly arrangement of the leaves; and it was probably from some of these capitals, which were a part of the loot taken by Sulla to Rome, that the Romans derived their normal type as seen at Mars-ultor and in the Pantheon.

The Tivoli type, he considered, for historic reasons, to be about 75 B.C.; and, showing slides of several examples, he suggested that some of them were intentionally archaistic; and that there had not been any further development from that type: the Classic and Renaissance architects basing their further variations on the canonical Mars-ultor type.

Mr. Stannus then proceeded to enunciate the principles governing the design. He emphasised the importance of giving the cauliculi the appearance of growing out of the shaft and the general effect of proportion and fitness to be secured; finally commending the capital to students as a type which offered many opportunities for individual treatment.

A discussion followed, in which Mr. R. Phené Spiers, Dr. Clay, and Mr. Hugh Davies took part.

DORIC ARCHITECTURE.

In a lecture on Doric architecture at Manchester University last week Prof. Capper threw some doubts on the common theory that all the temples of the great age of Greece were built on the same plan and according to well-ascertained rule. He took as examples four or five of the finest Doric buildings of the fifth century B.C., and showed that there are many interesting differences in the planning and construction, the arrangement of the sculpture, and so on. One difficulty in the way of such enquiries was the small amount that was definitely known; for instance, of the three most perfect examples of Greek Doric in existence—the so-called Temple of Concord in Sicily, that of Neptune at Pæstum, in Italy, and the Theseum at Athens—the dates were unknown. If it could be imagined that there were only three or four specimens of 13th century Gothic architecture remaining, and those in ruins, to a Greek of the age of Pericles it might well seem that all Gothic cathedrals were built on the same plan. In the same way we, in studying the scanty remains of the great Greek temples, might hastily conclude that there was very little variety in plan. Incidentally Prof. Capper brought out the point that the temples were designed not as places of worship, but as places for the reception of statues of the gods—abodes in which the gods might dwell. The conversion of some of the temples in later times into Christian churches, while it did the good service of preserving the structures, often wrought havoc with the architecture and the internal arrangements, because the Greeks invariably built their temples with the main entrance on the east side, while the Christians unfortunately closed these apertures, and built their altars on the sites thus provided, making the entrances on the west side. It is, however, largely to its conversion into a church that the Theseum owes its wonderful preservation.

R.I.B.A.

Mr. Collcutt's Presidential Address.

The opening meeting of the session of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the new president, Mr. T. E. Collcutt.

Mr. Alexander Graham announced with regret the deaths of members of the Institute since the last session.

The secretary stated that 17 candidates presented themselves for the examinations held in London last month for qualification as district surveyor in London. The following 9 passed :—H. W. Cubitt, W. R. Davidge, P. I. Elton, H. Kenchington, G. H. Lovegrove, W. H. Rogers, H. Shepherd, W. G. Shipwright and C. B. Young.

Mr. Collcutt then delivered his presidential address. At the commencement he plunged boldly into the question of **Architects' Registration** which, he said, had brought about a crisis in their history during the past few years, and at one time had threatened to involve them in a kind of party politics. The committee which had been appointed to enquire into the matter had ended its exhaustive labours last session, and had submitted a unanimous report, which, in its general scheme, had also been adopted unanimously by the Institute. The details, however, were referred to the council, with a direction that they should draw up a scheme for revising the charter and by-laws, and also a draft bill which it was proposed to submit to Parliament. The council then appointed a committee to prepare details of the scheme. "This," said Mr. Collcutt, "they have done so far as the revision of the charter and by-laws are concerned, and their draft scheme is now under the consideration of the council. We anticipate that the revision of the charter will improve the position of the practising architect." In dwelling with equanimity on the pleasant subject of their personal welfare, however, Mr. Collcutt said they should not ignore the sad condition of many of their less prosperous brethren; a subject brought very forcibly to mind by the many lamentable cases considered at a recent meeting of **the Architects' Benevolent Society.** It was a regrettable fact that among six or seven thousand practising architects in the United Kingdom there were only 447 who subscribed to this deserving society. Mr. Collcutt urged those to subscribe who had not done so. He then went on to consider the subject of

Public Competitions.

He said: "It has recently been suggested that in competitions for buildings of any magnitude, the responsibility of selection becomes too onerous to be entrusted to one assessor, and that competitors would feel greater confidence in the judgment of two or more. I entirely disagree with this idea, and to illustrate my opinion I venture to remind you of the result of the competition for the proposed Peace Palace at the Hague. This competition being of an international character, it was decided to invite six architects, representing various countries, to act as a jury of selection. Our Foreign Office requested the Institute to nominate an architect as representative of Great Britain, and our council did me the honour to elect me to this post. During last April I met my brother assessors at the Hague, and we forthwith embarked on the work entrusted to us. Our committee consisted in all of seven assessors, the president of the Peace Congress acting as chairman and voting with the six architect jurors. In my opinion the combined efforts of the seven jurors resulted in disastrous failure. To my mind the design placed first in order of merit should not have been placed at all. The instructions to competitors issued by the Peace Committee stated the proposed limit of expenditure. Now all the assessors agreed that the cost of carrying out the selected design would be no less than double the amount specified. Nevertheless, the jury decided by a bare majority that this design should receive the first premium in virtue of the excellence of its plan. It appeared to some of us that this plan possessed undoubted merits, but that these merits existed only because the designer had utterly ignored the limitation of the proposed expenditure. He would probably be obliged to remodel his plan in order to reduce the cost to a sum approximate to that at his disposal, and the special features that had attracted the assessors would thus be either eliminated altogether or else remodelled to such an extent as to lose the characteristics which had made them specially attractive.

"With regard to deciding what style of architecture would be most suitable for a monument of international peace and harmony, the majority of the jury inclined towards the Dutch style of the sixteenth and seventeenth centuries. On the other hand, a minority was in favour of a style common in some degree to most European countries. This minority considered that an adaptation of Italian Renaissance would be more international in character and more suitable in every way than any treatment of Dutch architecture could possibly be. However, the wishes of the majority prevailed. In spite of this, the principal characteristics of the design finally chosen were those of a French *château;* but I venture to think that this style of architecture, as illustrated by the successful designer, is not quite appropriate to a public and international building.

The question of assessors requires careful consideration. Should there be one assessor or a jury of several? My experience at the Hague led me to the conviction that when more than one assessor is appointed an altogether futile conclusion is likely to be the consequence. In this case, as I have pointed out, we were six architects, with a layman as chairman. The result of our combined labour was the choice of a design which we all agreed could not be executed under double the amount quoted in the instructions to architects. The design chosen was crowded with picturesque towers, gables, and roofs, most of which were quite unnecessary. As a supplement to our report we wrote a joint letter to the permanent committee wherein we advised that the future buildings should be monumental in character and without exuberance of ornament. We suggested that such extraneous features as towers, cupolas, &c., should be considered with the utmost reserve, and in this way our previous decision was completely stultified.

"I think I have shown that the final decision was a stupendous failure. It is probable that when more than one assessor is appointed the sense of individual responsibility is lessened. Perhaps each member of such a jury undertakes his arduous task with a feeling that the final result will be more or less in the nature of a compromise. In a jury of assessors there is also the possibility of a minority report, which may lead to difficulties with the employers, and perhaps to the abandonment of the awards. To my mind **the ideal arrangement** for deciding important competitions is the appointment of one chief assessor aided by one, or preferably by two, assistant advisers to whom he could turn for counsel or help. The assistants or assistant should have no voice in the ultimate decision; the entire responsibility should rest with the chief assessor.

"Although I have shown that the Hague competition was a failure, inasmuch as the best designs were overlooked, I do not wish to infer by this that I think competitions are a mistake, and that they fail to secure the best possible designs. On the contrary, I believe that it is to the interest of the public that a competition should be instituted for every proposed public building of importance. I do not deny that there may be many exceptions to this rule. The New Scotland Yard is a notable instance of such an exception; but the architect of that noble work stands by himself, as is recognised, I think, both by the public and by the architectural profession. It is said that buildings erected from competition designs fail more or less in reaching a high standard of architecture. There is, of course, a good deal of truth in this criticism; but I think it cannot be said with any approach to truth that public buildings, where there has been no competition, reach a higher standard.

"I think, in the interests of architecture, that every means should be taken to secure the best design possible, and as a rule this can be done by competition. Competition is also invaluable to the young architect for reasons beyond that of striving for a first prize: it gives him the opportunity of comparing his work with that of others and of taking home to himself, if he is modest, his weaknesses. Beyond this there is the chance of discovering genius which otherwise might strive in vain to make itself known.

"I think it is a matter of congratulation that the London County Council have decided to institute a competition for the building of **the proposed County Hall.** But I learn with dismay that it is their intention to make it open to architects of all nations. There is no precedent for such a course; and I think a vigorous protest should be made, in the interests of both the English public and the English architect, against a course which appears to be unnecessary and unjust, and one which no other nation would think of adopting. It is no question of dislike to meet our foreign brethren in competition that prompts this protest; it is that I feel that an international competition would be a direct slight to English art, and that it is to the English architect we must look for the production of a design that will illustrate the best traditions of English work.

"I feel sure you will share my opinion that the results of recent competitions go to prove that the younger generation is fully qualified to continue that advancement in the art of architecture which we all so earnestly desire. May I none the less offer

a word of advice

to our younger students? All who have had experience in judging competitions must have been struck with the number of designs submitted by competitors who are evidently in the first stages of their studentship. Let me counsel such beginners to realise that the art of design must be carefully studied, and can be mastered only by continued practice. An important competition does not offer the requisite opportunities for the student to learn his craft."

Having thus considered the subject of competitions at length, Mr. Collcutt went on to refer to the International Congress of Architects, held in London last July, and selected one of the subjects then dealt with as a theme for some personal views. This subject was

The Education of the Public.

A passage in Ruskin's "Stones of Venice" bore very directly on this question. (It had been said, Mr. Collcutt observed, that there were two classes of admirers of Ruskin—namely (1) those who believed in him as an art exponent, but thought him entirely ignorant of political economy; and (2) those who believed him to be a political economist, but declared he knew nothing of art.) However, Ruskin had said: "Every man has at some time of his life personal interest in architecture. He has influence on the design of some public building; or he has to buy and build his own house. It signifies less whether the knowledge of other arts be general or not: men may live without buying pictures or statues; but in architecture all must in some way commit themselves; they *must* do mischief and waste their money if they do not know how to turn it to account. And it is assuredly intended that all of us should have knowledge, in matters with which we are daily concerned, and not be left to the caprice of architects or mercy of contractors." Caprice of architects! Of course that might have been true fifty years ago, but now it was absurd!

The Grand Tour.

It might be taken for granted that public taste in painting and sculpture had developed during the last generation; but, notwithstanding the advice of Ruskin, it did not seem that there had been such an awakening of public interest in architecture. It was certain that the average cultured Englishman of to-day showed no such appreciation of architecture as did his predecessors. Our ancestors sought culture in the fine arts largely through the study of literature, but more through home and foreign travel. Undoubtedly far greater numbers travelled nowadays; but education in the arts was not really furthered by hurried visits to buildings and galleries, "Baedeker" and "Murray" in hand. In the olden times the Grand Tour was considered a necessity for every cultured gentleman, and had a lasting influence on English style.

An Architectural Tribunal.

"A question of paramount interest, not only to this Institute, but to the public generally, relates to the control over architectural schemes in connection with the laying-out of new streets and the erection of public buildings. This question has constantly been before this Institute, and a variety of suggestions have been made, some advocating a tribunal of art, others an advisory board, working in conjunction with H.M. Office of Works.

"I believe the present First Commissioner has instituted some kind of advisory body for the purpose of dealing with the Government offices now in progress of building; but this is only a temporary arrangement. The matter is of such universal importance, and the question of want of intelligent control over public undertakings so often arises, that one cannot but feel that this Institute should give special attention to the subject.

"An architectural tribunal might become an influence in dealing with subjects not directly connected with street improvements or the erection of public buildings. For instance, there is one question suggested by our Arts Committee on which they have reported—namely the possible substitution of stone for the present wooden pediment and dome crowning the river façade of Somerset House. It is impossible to conceive that Sir William Chambers would have erected a wooden structure where stone was so obviously the material that should be employed, had not the exigencies of the plan precluded the use of the heavier material. But in this age of steel it would be a comparatively easy and inexpensive matter to add steel stanchions and girders to the interior of the building, and to erect thereon a stone dome. This would only involve trifling alterations to the rooms under the dome. This suggestion may be criticised on the ground that it is not true construction to erect a stone dome on steel stanchions and girders. But I believe that in Sir William Chambers's time, and since, the present dome was painted to look like stone; and this was surely more in the nature of a sham than the proposal now laid before you."

Mr. Collcutt then referred to the lack of appreciation for art, which resulted in buildings seldom being thoroughly completed, instancing the Victoria Memorial in St. James's Park, which, he feared, would be mutilated from lack of funds, and the Stone Arcade, a feature which of all others was the one necessary to complete and give full effect to a work worthy of the nation, eliminated.

Planning of Thoroughfares

On the subject of the Report of the Royal Commission on the Traffic of London Streets, he thought that the Institute should endeavour to make itself distinctly audible when any scheme which dealt with London streets was being considered. Many architects had made a study of this question, but the general public seemed to regard it with indifference, and the consutution of the L.C.C. did not always enable it to take the broadest and most statesmanlike view of such matters. For instance, in laying out the Aldwych site the L.C.C. had certainly failed to procure the finest view of those great features, the Churches of St. Mary and St. Clement Danes, although at the instance of the Institute some improvements were made to the original plans. In the present construction of the County Council expert qualification was not a necessary factor. Councillors and aldermen were not elected in virtue of any special knowledge.

Removal of Charing Cross Railway Station.

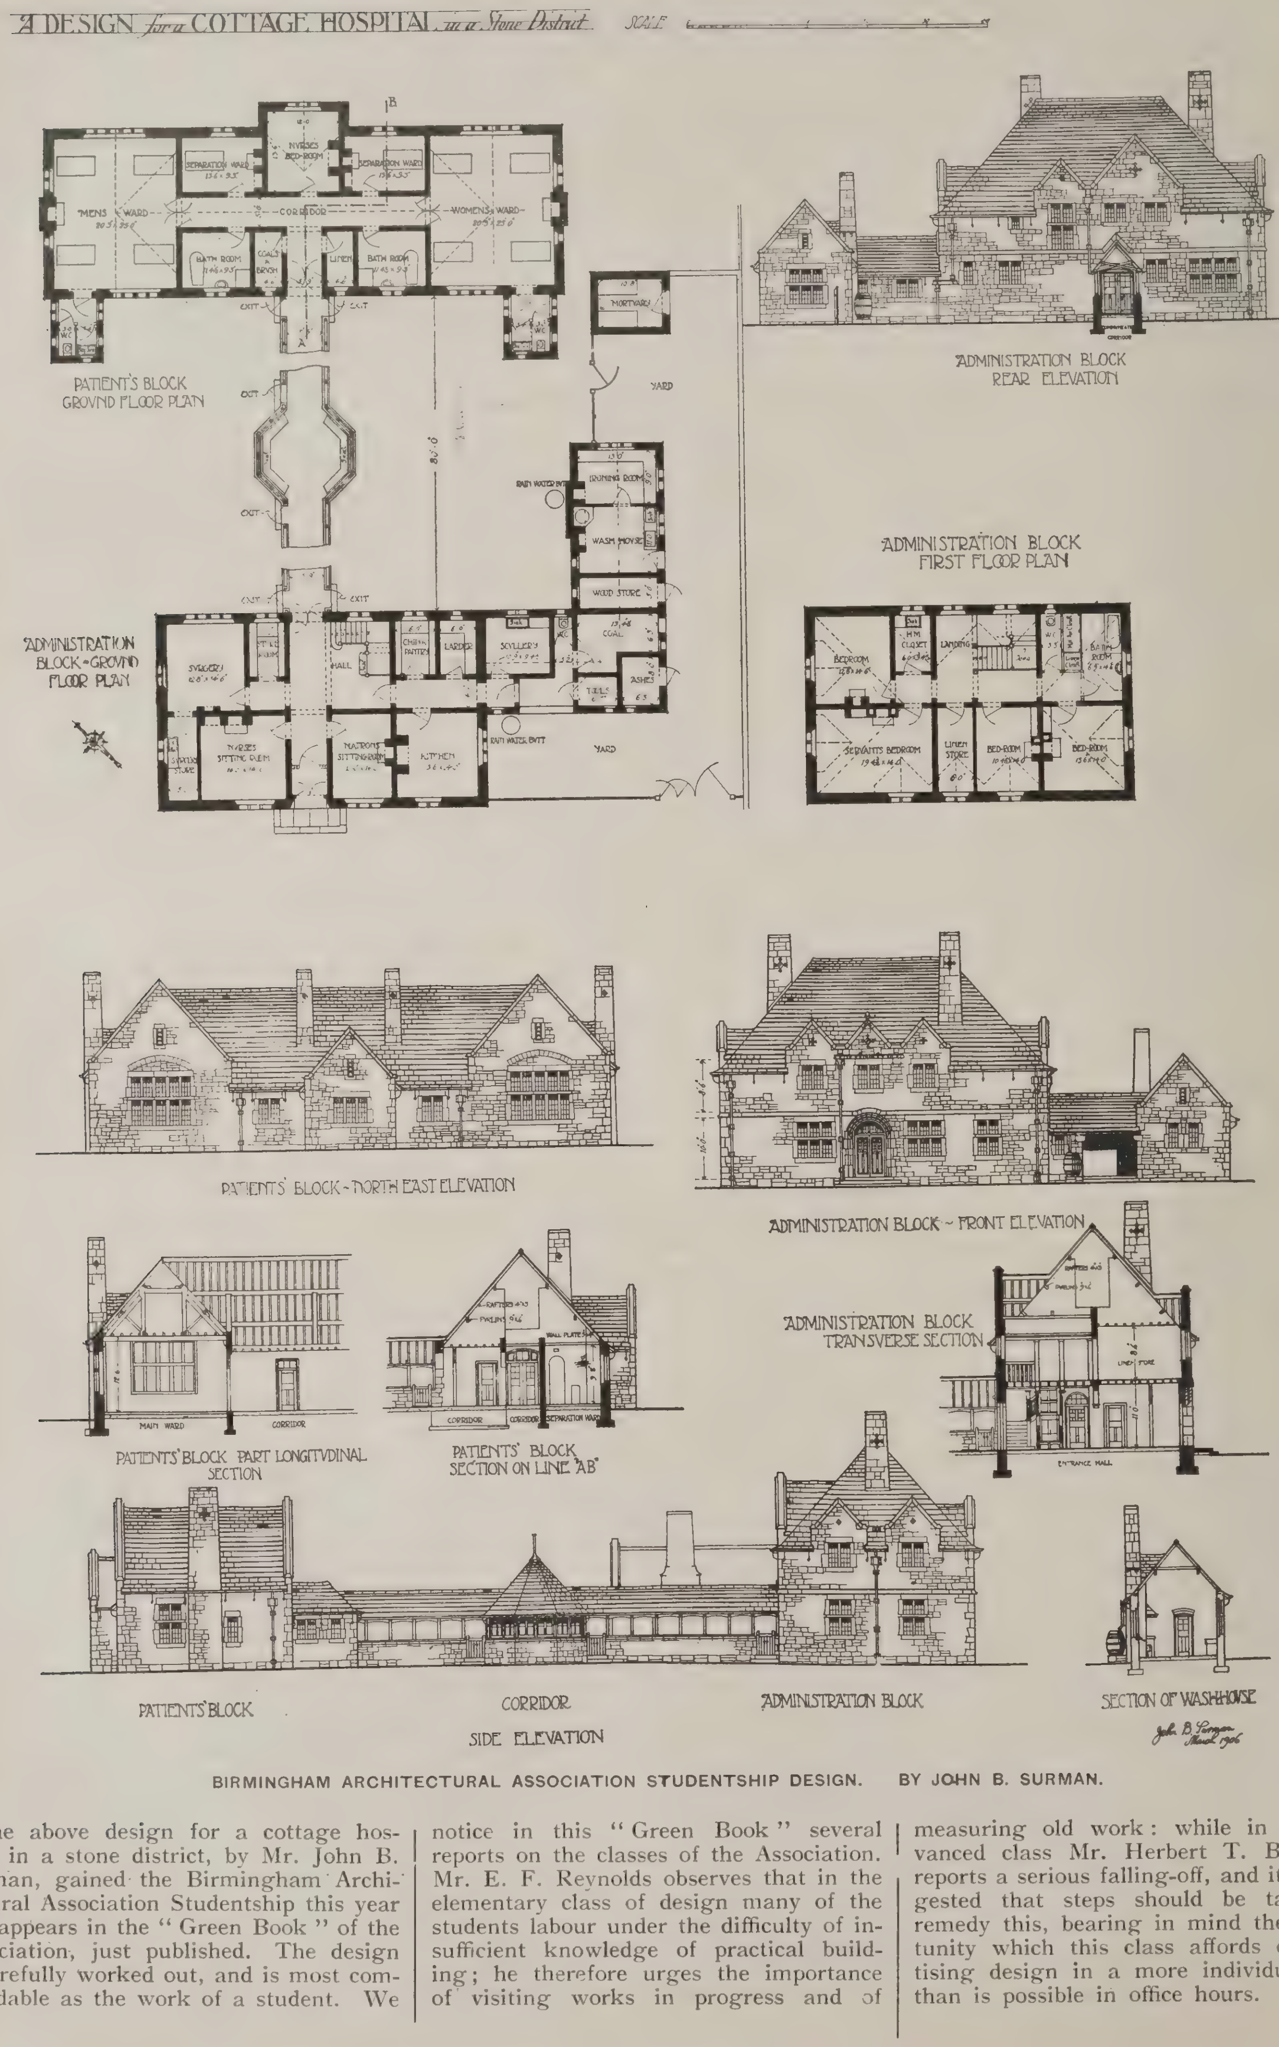
In connection with this question of improvements in thoroughfares, he referred to the collapse of the Charing Cross Station roof. When this disaster took place it was immediately suggested that a new terminus might be erected on the south of the river. The present space occupied by the station and hotel was of such enormous value that the railway company, had they adopted the scheme, would have been but little out of pocket. The gain to the public would have been a new bridge for foot passengers and for wheeled traffic. There could be no doubt that a bridge at this point was much needed, Waterloo Bridge being about 700 yards to the east, and Westminster about 1,200 yards to the south.

He believed the directors of the company fully recognised that a terminus on the south side would have been a great improvement from the point of view of the railway requirements. The vast amount of traffic could have been dealt with more easily. The chief argument that could be urged against the removal of the station was the serious objection that the public would certainly make to crossing the river by an open bridge, exposed to all weathers, instead of entering the station by its present easy access. This objection, in addition to the greater distance of the terminus from the City and West End, might have materially affected the suburban traffic, and it probably decided the directors of the company to remodel their terminus on the original site. But it was quite possible that an opposite decision might have been arrived at could it have been shown that a bridge was not necessarily an open structure.

Mr. Collcutt concluded by hoping that such questions as the Education of the Public and the appointing of an Art Tribunal were within the range of practical politics. It might be assumed that the important question of the higher Education in Architecture which would be open to the student was attracting the attention it deserved, and we might anticipate that in the near future a complete scheme would be developed. The rising generation of architects had given substantial proof of a vital desire to improve and ennoble their art, and he sincerely believed that their earnest endeavours would result in fine achievements, and that they would leave noble memorials of 20th century work, comparable, if not equal, to that of our forefathers.

Sir H. Trueman Wood, in proposing a vote of thanks to the president for his address, mentioned that it was just 27 years ago that he had the pleasure of intimating to Mr. Collcutt that the *Grand Prix* at the Paris Exhibition had been awarded to him for his design for the Imperial Institute—an honour to be counted greater then than now, because though the French were willing to admit our superiority in matters of machinery, they were not disposed to admit artistic ability in an Englishman.

Sir Aston Webb, who seconded the vote of thanks, also gave a retrospect, mentioning how thirty years ago he, with Mr. Collcutt and other enthusiasts, pledged themselves not to take part in any competition unless there was an assessor. Under the ægis of Mr. Street a memorial was presented and signed by architects in general, and with good results. Sir Aston Webb touched on many other matters, stating, in connection with the Queen Victoria Memorial, that by next spring it was hoped the hoarding round the memorial would be removed and Mr. Brock's fountains and other work disclosed.



BIRMINGHAM ARCHITECTURAL ASSOCIATION STUDENTSHIP DESIGN. BY JOHN B. SURMAN.

The above design for a cottage hospital in a stone district, by Mr. John B. Surman, gained the Birmingham Architectural Association Studentship this year and appears in the "Green Book" of the Association, just published. The design is carefully worked out, and is most commendable as the work of a student. We notice in this "Green Book" several reports on the classes of the Association. Mr. E. F. Reynolds observes that in the elementary class of design many of the students labour under the difficulty of insufficient knowledge of practical building; he therefore urges the importance of visiting works in progress and of measuring old work: while in the advanced class Mr. Herbert T. Buckland reports a serious falling-off, and it is suggested that steps should be taken to remedy this, bearing in mind the opportunity which this class affords of practising design in a more individual way than is possible in office hours.

Notes on Competitions

The task of the competition reformer as he marches along the path of endeavour, armed with the cudgel of reproof and harassed by the beasts Ignorance, Ineptitude, Inconsideration and other species, common or rare, which beset his way, is no light one. The cudgel is wielded, and a monster despatched only to reappear at no short distance. Cries for help are raised to those with greater strength and better armed. But the mighty sit lethargic, heeding appeals with scorn, safe within their fence of privilege, making no movement, save now and then the feeble hurling of an inoffensive missile. An annoyance much to the front just now is the withholding of conditions from all except those who are willing to purchase without previously examining them. The attitude of promoters in this respect is typified by the silence with which a communication of a certain body, noted for its zeal, has been received. The communication was made on behalf of architects who desired to obtain some knowledge of the nature of certain conditions, but who did not wish to risk a rather large deposit, which might not be returnable in the event of their deciding not to submit a design. A loan of the conditions was requested in order that brief information upon their nature might be disseminated. It was pointed out that this would enable intending competitors to decide definitely whether they would compete or not, and that affirmative decisions would be followed, in due course, by applications for the conditions and remittances of the required deposits. This reasonable and polite request was made on the 23rd October. No acknowledgment or reply of any sort has been received. It may not be a breach of confidence to mention that the case is that of the secondary school at Goole. The deposit required for conditions is two guineas. The refusal of the authorities at Sunderland to part with the conditions for the children's hospital, under similar circumstances, was mentioned last week. Birmingham adopted the same course with the Council House extension some time ago. Many other instances will occur to competing architects. What is the remedy? It is useless to hope for concerted action on the part of competitors; the apparent apathy of the majority is too marked for this. The enlightened minority are, by reason of their numerical weakness, unable to effect more than an occasional victory. The persistence of their endeavour may tell in the long run, but, in the meantime, the evil will continue. The subject has been brought before the R.I.B.A. more than once. Their disregard of appeal, their callousness of the convenience of their younger members who lack guineas, and their indifference to a ridiculous imposition may all be gathered from conditions which have from time to time emanated from the hands of assessors nominated by them, conditions unobtainable by other means than purchase, without reservation. It is but fair to acknowledge that conditions issued under the auspices of the R.I.B.A. are, in most respects, reasonable. The point in question is one which might easily be overlooked. It is only by persisting in its recognition that the inclusion of a not unprecedented clause may ultimately be recognised as essential.

Children's Hospital, Sunderland.

The promoters of this competition have responded in some measure to the appeal made for the lightening of onerous conditions which were commented upon in these columns last week. Most satisfactory is the announcement that it is intended to ask the assistance of the R.I.B.A. in the appointing of an assessor, who will award the premiums offered. If the assessor thus appointed possesses a full knowledge of the vagaries of conditions and of the nature of his office, the result should be (1) an ascertaining of the sufficiency of the stipulated cost of the buildings; (2) an undertaking that the author of the first premiated design should be entrusted with the work; (3) a recognition of a safety margin of cost. The last contingency has been met by the promoters themselves, who have stated to an enquirer that the clause as it stands—that all designs will be rejected which exceed the limit of cost—is merely a safeguard to the committee, and that they regard it as inconceivable that a plan, otherwise suitable, should be rejected, if the cost exceeds the estimate by more than five per cent. This is evidence of a more reasonable attitude than it was possible to ascertain from a mere perusal of the conditions.

A Glasgow Building Estate.

We referred last week to the unsatisfactory conditions of the competition of the Corporation of Glasgow for the layout of its estate at Riddrie. The Glasgow Institute of Architects has now taken up the cudgels. The Institute has addressed a letter to the Town Clerk expressing the opinion (1) that the premiums offered (£75, £50 and £25) are inadequate, while no guarantee of employment is given; (2) that there should be an independent assessor to advise the Committee; (3) that the plan of the site supplied to competitors does not give any levels, nor the necessary information for laying-out roads and forming sewers; and (4) that there is no indication given of what drawings are required, and the scale they are to be.

Edmonton Infirmary.

The Edmonton Board of Guardians has selected Mr. Rowland Plumbe, F.R.I.B.A., to assess the competitive designs for its new infirmary, which are to be invited from Mr. Stuart Hill, Mr. W. H. Ward, Mr. Marcus Collins, Mr. A. E. Pridmore and Mr. W. A. Pite. The building is estimated to cost £200,000.

Convalescent and Nurses' Home, Glossop.

In this competition the design placed first by the assessor is that of Messrs. Bulman & Vinycomb, 67 and 69, Chancery Lane, London; second, Mr. Basil C. Deacon, 8, Finsbury Terrace, Swansea; third, Messrs. Woodhouse, Corbett & Dean, 100, King Street, Manchester. Ninety-six sets of designs were submitted. The assessor says :—"Generally these are of an excellent character, and the aggregate actual expenditure in connection with the preparation of these designs, leaving out of consideration the time of the principal, must have been about £1,000. In the majority of cases the schemes submitted by the competitors could not, in my opinion, be executed for the amount proposed to be expended. Many competitors have placed the principal and minor administration entrances on the same front as the patients' garden, thereby destroying its privacy and quietness. I need hardly remind the committee that many of the drawings, perspectives in particular, convey a false impression of how a building would look if erected in accordance with such drawings."

Library, Museum and Art Gallery at Plymouth.

The instructions to architects drawn up by the assessor (Mr. Henry T. Hare) in regard to the competition among local architects for the free library and the museum and art gallery proposed to be erected in Tavistock Road, Plymouth, have been approved by the Museum and Art Gallery Committee. As the Free Library Committee have already confirmed the instructions, the preliminaries to the competition have now been disposed of, and architects who intend competing are now in a position to know exactly what is required of them. Although the two schemes are distinct, and on a different basis, designs are to permit of the simultaneous erection of both buildings, but, at the same time, the conditions provide that the free library may be proceeded with before the museum and art gallery, if anything necessitates delay in the erection of the latter. It is estimated that a saving of about £1,500 can be effected if the two buildings are included in one contract and erected together.

Model Village, Brodsworth.

Fifteen designs have been received for the model village proposed to be erected near Brodsworth, Doncaster, by the Brodsworth Colliery Co. Provision for 500 houses is required. A premium of £100 is offered for the design placed first by the assessor.

List of Competitions Open.

Deposit for conditions given where known.

DATE OF DELIVERY	COMPETITION.
Nov. 30	LIBRARY AT NEWTON-IN-MAKERFIELD.—Cost £4,000. Particulars from C. Cole, clerk to U.D.C., Town Hall, Earlestown, Lancs. No deposit.
Dec 12	LAY-OUT OF RIDDRIE ESTATE, GLASGOW.—Premiums of £75, £50 and £25. Particulars from A. W. Myles, town clerk, City Chambers, Glasgow. No deposit.
Dec. 31	DUAL SECONDARY SCHOOL AT GOOLE.—Premiums £50 and £25. Particulars from James W. Johnson, clerk to Governors, Council Offices, Goole. Deposit £2 2s.
Dec. 31	NURSES' HOME AT GENERAL HOSPITAL, WOLVERHAMPTON.—Particulars from J. Stephen Neil, House Governor and Secretary, General Hospital, Wolverhampton. No deposit.
Dec. 31	BATHS AT ASHTON-IN-MAKERFIELD.—Limited to architects in Wigan and Leigh Poor Law Unions. Particulars from A. Sykes, clerk, Council Offices, Ashton-in-Makerfield. No deposit.
1907 Jan. 19	LIBRARY AT PLYMOUTH.—Premiums £50, £30 and £20. MUSEUM AND ART GALLERY AT PLYMOUTH. Premiums £25, £20 and £10. Limited to local architects. Particulars from Borough Librarian, Plymouth
Feb. 1	CHILDREN'S HOSPITAL AT SUNDERLAND.—Premiums of £100, £50 and £25. Particulars from T. Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland. Deposit £1 1s.
No date.	ALTERATIONS TO UNION AND VESTRY OFFICES IN WESTBAR, SHEFFIELD. Limited to Sheffield architects. Premiums £25, £15 and £10. Particulars from A. E. Booker, clerk to Guardians, Union Offices, Westbar, Sheffield. No deposit.
No date.	BRANCH LIBRARY AT DUNFERMLINE. Particulars from Secretary, Carnegie Dunfermline Trust, St. Margaret's, Hull, Dunfermline.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Cost of Country House.

EDINBURGH.—GLENEVAN writes: "I am at present getting together particulars for the building of a small country house, and would be obliged if you could give me a rough idea of the cost. The house would be situated in about one acre of ground, one mile from a main line station, and the same distance from the quarry. It is proposed to build with the local whinstone and to be rough-cast. The size of the rooms would be—dining-room 20 by 18, drawing-room 16 by 14, parlour 16 by 14, hall 18 by 16, three bedrooms 16 by 15, two bedrooms 14 by 14, bathroom 12 by 12, servants' room 14 by 14, laundry, scullery, wine cellar and lavatory in hall. Workmanship first-class throughout."

It is quite impossible to give any definite reply to your enquiry, because everything depends upon specific conditions. The house might possibly cost between £2,000 and £3,000. We recommend you to purchase "Country Cottages and Week-end Homes," just issued by Messrs. Cassell & Co., London, price 5s. nett. The book illustrates a large number of small country houses, and gives the cost of most of them.

Cesspools at Country Schools.

ST. AUSTELL. — RUSTICUS writes: "Which is the best way of emptying and cleaning cesspits used in drainage systems at small country schools? The Local Government Board insist that these be made watertight, without overflow; consequently they must be periodically cleaned out and emptied. As the solid matters would not be a large percentage of the capacity of the pit it practically resolves itself into a question of disposing (after removal from pit) of the liquid at fairly frequent intervals and cleaning solid matter out at longer intervals."

The best method of emptying a cesspool is to use one of the modern pumping apparatuses. In this arrangement the sewage is pumped direct from the cesspool into a barrow or cart and taken away. This apparatus is manufactured by several makers, of which Merryweather is one. The same thing, however, can be done with an ordinary portable diaphragm pump and an old water barrel, sufficient hose being provided to connect up between the pump and the cesspool and the pump and the cart.

By-laws as to Piggeries.

LANCS.—A.S. writes: "Is it in the power of an urban district council, whose present by-laws provide that no piggeries shall be at a less distance than 60ft. from the nearest dwelling, to adopt new by-laws limiting the number of pigs to be kept at a distance of 100ft. to 3, and at 200ft. to 6, and at 300ft. to 20 pigs, making the new by-laws to act retrospectively?"

An urban district council is quite within its powers in making such a by-law as that suggested in this case, but before it can be enforced it must be first submitted to the Local Government Board and must be confirmed by them (section 184, Public Health Act, 1875). I have never known any by-law to be retrospective, and do not think the Local Government Board would approve of such a proposal. One could never tell where the mischief would stop. F.S.I.

Bending Moments on Continuous Girder.

CARLISLE.—S. L. writes: "In designing a continuous girder over four supports, subject to an evenly-distributed load, it is the most economical plan to make the two end spans four-fifths of the centre span. Please give formula for the maximum bending moments under this condition. Take for instance a girder as sketch stressed with 1 ton per foot run. What are the reactions of each support? What effect would be caused by any one of the spans being freed from its load? What is approximately the minimum depth of girder over span that should be used?"

The proportion of spans and nature of loading are shown in Fig. 1. Fig. 2 shows the corresponding bending moment diagram with the formulæ for the ordinates. The shearing force diagram is shown in Fig. 3, and is obtained as follows:—Let ABCD be the girder with two intermediate supports B and C. from points B and C set up BE and $CF=\frac{13wl}{32}+\frac{L^2}{3l}\left(\frac{2w}{7}\right)$ where $L=\underline{l+l'}.$ Make BG and CH each$=\frac{wl}{2}$ and join G and H to mid-span J. Draw EK and FK parallel to GJ and HJ respectively. For the end spans erect $BL=\frac{2wl'}{3}$ and at A erect $AM=\frac{1}{2}BL$. Join M and G to P, distant $\frac{1}{3}l'$ from A. Make $AN=\frac{wl'}{2}-\frac{3wl^2}{32l'}$. Draw NO and LO parallel to MP and GP respectively, giving the shear diagram as shown by ordinates. The reactions may be obtained from the shear diagram thus:—Assuming the reactions to be equal to the shear at the supports the reaction at

$$A=AN=\frac{wl'}{2}-\frac{3wl^2}{32l'}=\frac{1\times16}{2}-\frac{3\times1\times20^2}{32\times16}=$$

6.83 tons. Reaction at

$$B=2BE=2\left\{\frac{13wl}{32}+\frac{L^2}{3l}\left(\frac{2w}{7}\right)\right\}$$

$$=2\left\{\frac{13\times1\times20}{32}+\frac{(16+20)^2}{3\times20\times}\left(\frac{2\times1}{7}\right)\right\}22.4$$

tons, but it will be sufficient if the reactions are taken as $\frac{1}{10}W$ at A=5.2 tons, and $\frac{4}{10}W$ at B=20.8 tons, where W= total load. Fig. 4 shows the bending moment diagram with the end spans carrying no load except their own weight of w' tons per foot run, and Fig. 5 shows the bending moment diagram with the middle span only unloaded. The depth of a girder is regulated partly by the stresses to be met. For a continuous girder about $\frac{1}{15}$ to $\frac{1}{18}$ of the span would be suitable. HENRY ADAMS.

Strength of Brick Piers.

MANCHESTER.—N. F. S. writes: "On what basis do you calculate the strength of brickwork in deciding what size a detached pier shall be to carry a certain weight? What allowance is made for the height of piers? What factor of safety is adopted for detached piers?"

The strength of brickwork is usually calculated at a given working stress per square foot, or at a certain proportion of the first fracture stress. For example:—

Material.	Safe load tons per sq. ft.	Proportion of first fracture load.
Blue brick in cement	9	$\frac{1}{8}$
Stock brick in cement ...	6	$\frac{1}{5}$
Stock brick in lias mortar ...	5	$\frac{1}{4}$
Stock brick in grey lime mortar	3	$\frac{1}{4}$
Portland cement concrete (6 to 1)	5	$\frac{1}{8}$
Lias lime concrete (4 to 1) ...	3	$\frac{1}{6}$

These are the loads at the lowest points—*i.e.*, including the weight of the structure itself. Where dead loads only are to be carried, and the work is constructed under strict supervision, there would be no danger in increasing the values by 50 per cent., but it must be remembered in judging from experiments that the general minimum should be taken, not the average. It is generally considered that the loads given above may be adhered to in the case of independent piers where their height does not exceed six times their least width, and that beyond this proportion a reduction must be made. Say w=tons per sq. ft. as given above, r=ratio of height to least width, then safe load tons per sq. ft.$=w\left(\frac{24-r}{18}\right)$. If the pier is bonded to a wall, as a pilaster in the length of it, the thickness of the pier would be increased by the thickness of the wall, and the safe load would be somewhere about that due to a similar-sized independent pier of half the height: in other words, the wall may be considered to double the strength of the pier. When the pier is bonded to the end of a wall, as to the front of the party wall between adjoining shops, there is less bonding and stiffening, and a fair allowance would be to consider it as an independent pier of three-fourths the height, nothing being added for the thickness of wall. Every case must be considered on its merits; there would be no skill in designing if everything depended upon formulæ.

Notes and News

A New Lancashire Asylum is proposed to be built at Whalley.

"Baronial" Villas Compulsory.—The Marquis of Bute stipulates that new villas on his estate at Bute must be in the "Scotch baronial" style.

At the Leys School, Cambridge, a new chapel in memory of the late Rev. W. F. Moulton, D.D., first headmaster, has been completed at a cost of about £8,000. Mr. Robert Curwen was the architect.

Messrs. Doulton & Co., Ltd., have been awarded a Diploma of Honour and the Grand Prix at the Milan Exhibition in the Hygienic Section for sanitary appliances.

Mr. T. H. Batstone desires to make it generally known that he has no connection with any other firm but Messrs. Aldam Heaton & Co., Ltd., interior and ecclesiastical decorators, 28 & 29, Baker Street, Portman Square, London, W.

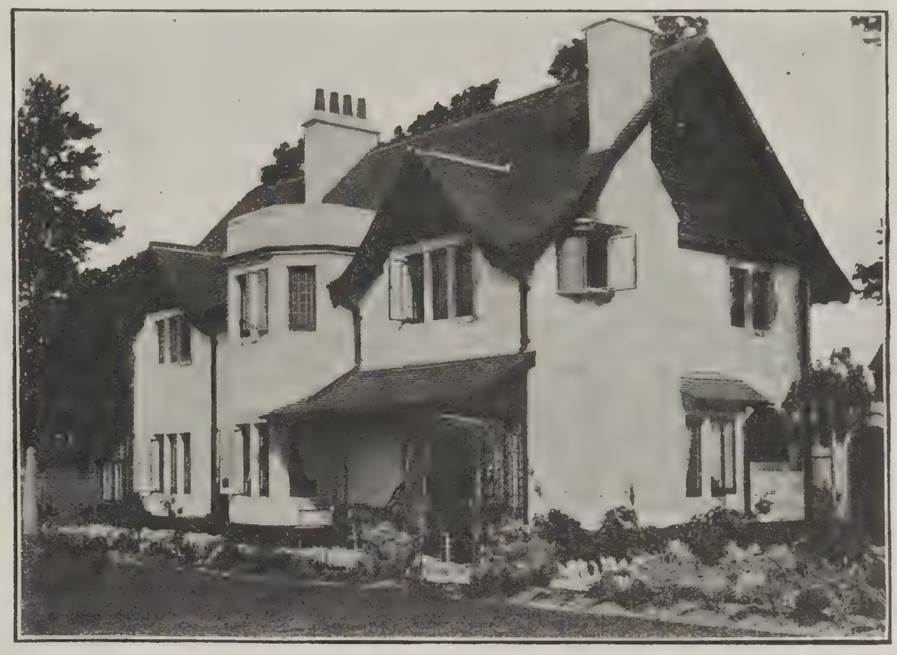
The Auld Brig of Ayr is to be put into a state of good repair at once. The work will be carried out by Messrs. Simpson & Wilson, civil engineers, of Glasgow, in conjunction with an archæological expert.

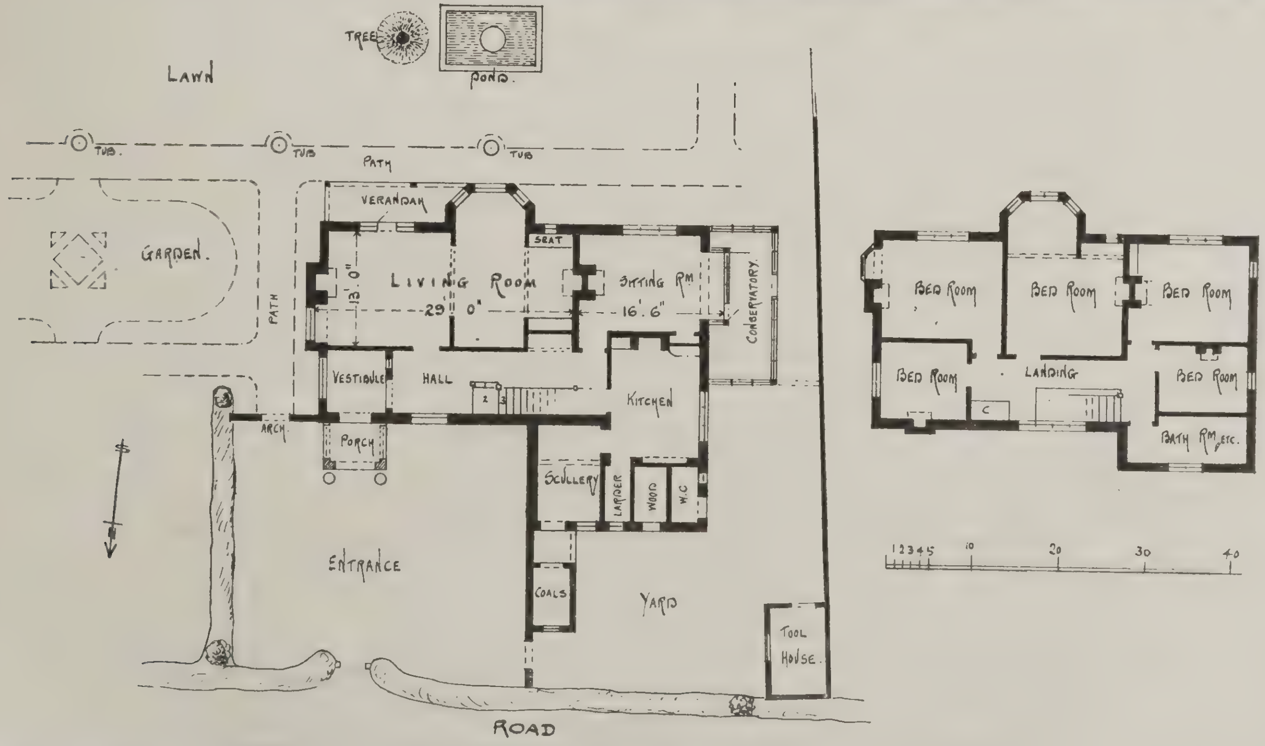
New Buildings at University College, Reading, have just been completed at a cost of £50,000. The architects were Mr. W. Ravenscroft, F.R.I.B.A., and Mr. C. S. Smith, F.R.I.B.A., of Reading, and the builders were Messrs. Kingerlee, of Oxford.

The Restoration of Tintern Abbey.—Considerable progress has been made with the work of restoring and preserving Tintern Abbey, now Crown property. During the past twelve months the resetting of the centre mullion and what remains of the tracery in the great east window has been completed, and the walls have been repaired. Much work remains to be done, especially in connection with the eastern arch of the tower and with the north transept.

Glasgow Architects.—Mr. James Lochhead, A.R.I.B.A., delivered his presidential address to the Glasgow Architectural Association last week. He laid stress on the necessity for a thorough understanding and collaboration, not only between architects and contractors, but between architects themselves: he also dealt with the regrettable state of public opinion in regard to architecture, and expressed the wish that the general press might bestow on the efforts of the architect a little of that interest which was lavished on sculptors, musicians and painters. At the close of his address he referred to the projected amalgamation of the Association with the Glasgow Institute of Architects. This matter was also referred to at the quarterly meeting of the Glasgow Institute held last week, when the recommendation of the Council to proceed with the amalgamation was unanimously approved.

The Mall Improvement.—The fine processional road constituting the remodelled Mall in St. James's Park has been completed for some time, and work is now in progress at the eastern end, where an opening has been made into Charing Cross. At this end there will be a triple archway, with buildings on either side (to be occupied by the Admiralty), and it is hoped that the scheme will be completed by 1908. Sir Aston Webb is the architect. On the footway near the arch there will be some fine new lamps, which have been designed by Mr. Brock, R.A., who also, of course, is the sculptor for the National Memorial to Queen Victoria, now in course of erection at the western





HOUSE AT LITTLEHAM CROSS, NEAR EXMOUTH. ERNEST E. ELLIS, ARCHITECT.

This house is on the estate of the Hon. Mark Rolles. Walls are cement rough-cast, finished white, with Bath stone dressings to windows; roofs of red Bridgwater tiles; weather boarding in gables. Mr. Ernest E. Ellis, of Exmouth, was the architect.

end of the Mall, in front of Buckingham Palace. The new gates in front of the Palace are very fine examples of beaten ironwork. They have been made by the Bromsgrove Guild. Opposite the Duke of York's steps will be placed the Royal Artillery South African memorial.

Obituary

Mr. Jonathan Skippen, Yarmouth's oldest builder, died recently, aged 77.

Mr. George Clark, builder and timber merchant, Stroud, died recently, aged 80.

The late Mr. J. T. Micklethwaite, F.S.A., architect and surveyor to the Dean and Chapter of Westminster, who died on Sunday week last, was buried in the Abbey on Wednesday. He will be long remembered as an able and experienced architect, with a wide learning as an antiquary and an archæologist. In knowledge of the Abbey Mr. Micklethwaite had no rival, save Thomas Wright, clerk of works, who died some months ago. Mr. Micklethwaite was born in 1843, and educated at King's College, London. He was articled to Sir Gilbert Scott in 1862, and commenced work as an architect seven years later. He was appointed architect to Westminster Abbey in 1898. In 1870 he was elected a fellow of the Society of Antiquaries. He was author of "Modern Parish Churches: Their Plan, Design, and Furniture," published in 1874, and of many papers on archæological and antiquarian subjects. His burial in the Abbey recalls the fact that Sir Charles Barry, Mr. George E. Street, Sir G. Gilbert Scott, and Mr. J. L. Pearson were interred there during the past century.

Correspondence.

Bent Joist to Carry Roof.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—On looking through your issue for June 13th last I am surprised to find what appears to me to be an error in the reply to an enquiry about a bent joist to carry roof. At the bend in the joist under consideration the bending moment is given as 13.5ft. tons—*i.e.*, 162 inch-tons—and the covers have only a resistance of about, say, 18ins. The covers would, therefore, be loaded to a maximum fibre stress of over 8.7 tons, whereas the joist itself is loaded to about 3.7 tons per sq. in. maximum. The joist at the heaviest loading develops about 5 tons maximum fibre stress, and I presume you would not load the cover plates beyond this. Keeping the covers within this stress they should be at least 14ins. deep, whereas to be stressed similarly to the joist at that point they would be about 16ins. deep. With the joist as shown the cover could only be about 10.6ins. deep. My reason for calling your attention to this is that when larger joists are dealt with the ordinary method of covering the web is insufficient with reasonable proportions in the work, and it is then necessary to cover the flange with a tension member which is also bent. How would you propose to cover a bent joist, say, 18ins. by 7ins. by 75lbs.?—Yours truly,

LONDON. J. LUMSDEN RAE.

To the Editor of THE BUILDERS' JOURNAL.

SIR,— In the case referred to it will be seen from Fig. 1, page 320, June 13th, 1906, that if the wall is taken as rigid the short bent portion of the rolled joist is in the position of a strut, and although the wall cannot be taken as perfectly rigid there will be enough stiffness to considerably relieve the tension at the joint. It might, perhaps, have been desirable to add a cover plate under the bottom flange. A bent joist 18ins. by 7ins. by 75lbs. could have the joint strengthened in the same way by web plates and cover plate to flange, but frequently web plates only are used.—Yours truly,

LONDON. HENRY ADAMS.

Our Plates

Cardiff City Hall and Law Courts.

We referred in our last issue to the splendid new City Hall and Law Courts which have been erected in Cathays Park, Cardiff, from designs by Messrs. Lanchester and Rickards. We are now able to give a general view of these two buildings. Perhaps the finest portion is the central block comprising the council chamber. In the City Hall building the chief apartments are—the assembly hall, which has a very rich plaster ceiling by Mr. Bankart, and some fine electroliers suspended down the centre; the council chamber, with its appurtenant rooms; and extensive suites of offices for the various departments. The Law Courts are divided into two main portions—the Assize Courts and the Police Courts. The plans of these will be found in our issue for March 15th, 1905. The design is the outcome of a competition held in 1897, for which premiums of £500, £300 and £200 were offered. It was not until 1899 that tenders were invited. The lowest of these was £129,705 for the City Hall and £96,583 for the Law Courts, making a total of £226,288. We believe however that, including the site, the total cost of the buildings has been nearly half a million. The general contractors were Messrs. E. Turner & Sons, of Cardiff. An excellent series of 35 illustrations of the buildings is given in "The Architectural Review" for November, accompanied by a descriptive article on the work by the architects. The total height of the clock tower is nearly 200ft., and the height of the dome more than 100ft.; while the two towers of the Law Courts reach 120ft.

New London Buildings

At yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:

Wood and glass roof over a portion of the yard at the rear of No. 52, Mile End Road, Stepney. *(Rescission of resolution.)*

Conservatory over the entrance porch at No. 1, College Terrace, Fitzjohn's Avenue, Hampstead. *(Rescission of resolution.)*

Wood and glass conservatory over the entrance porch at No. 1, College Terrace, Fitzjohn's Avenue, Hampstead, without the walls under such conservatory being thickened, on the application of R. Smith & Son, on behalf of Dr H. Roger Smith. *(Consent.)*

Six one-storey shops in front of a portion of "The Priory," between Nos. 408 and 418, High Street, and Nos. 436 and 438, High Street, Lewisham. *(Rescission of resolutions.)*

Four one-storey shops in front of a portion of "The Priory," between Nos. 408 and 418, High Street, Lewisham, on the application of R. C. Fry, on behalf of W. J. Larke and H. O. Larke. *(Consent.)*

Two one-storey shops in front of Nos. 436 and 438, High Street, Lewisham, on the application of R. C. Fry, on behalf of W. J. Larke and H. O. Larke, *(Consent.)*

Retention of a porch and the erection of two porches in front of houses on the northern side of Larkhall Rise, Clapham, between No. 68 and the London, Brighton and South Coast Railway, on the application of J. Mayo. *(Consent.)*

One-storey addition in front of a motor house at "Baldorran," on the western side of College Road, Dulwich, on the application of W. Griffiths, on behalf of Bowyer & Co. *(Consent.)*

Retention of buildings on the eastern side of Pennard Road, Hammersmith, abutting upon the northern side of Goldhawk Road, on the further application of A. W. Hudson, on behalf of Gruntwag & Morton *(Consent.)*

Two-storey building at "The Wharf," Hythe Road, Willesden Junction, on the application of A. W. Collins. *(Consent.)*

Three wooden oriel windows at the second floor level, and a one-storey bay window and porch at the ground floor level in front of No. 52, Cromwell Road, Kensington. and two wooden oriel windows at the eastern flank of such building, on the application of Hampton & Sons. *(Consent.)*

Retention of an oriel window at the rear of No. 11, Sussex Square, Paddington, abutting upon Bathurst Mews, on the application of Hoare & Wheeler. *(Consent.)*

Refacing of the front and part of the flank of Bute House, No. 75, South Audley Street, St. George, Hanover Square, on the application of R. Philip, on behalf of H. L. Bischoffsheim. *(Consent.)*

Projecting oriel window at the second and third floor levels, and three projecting balconies at the second floor level on the Cockspur Street frontage of a building to be erected on the site of Nos. 14, 15 and 16, Cockspur Street, and Nos. 8, 10, 12 and 14, Warwick House Street, Strand, on the application of Stock, Page & Stock, on behalf of the Direction der Disconto-Gesellschaft. *(Consent.)*

Oriel window in front of Nos. 50 and 51, Fetter Lane, City, on the application of W. E. Hazell, on behalf of R. Melluish. *(Refusal).*

Motor-car shed at No. 205, Upland Road, East Dulwich, to abut upon Crebor Street, on the application of E. G. Young. *(Refusal).*

Additions at No. 50, Addison Road, Kensington, to abut upon Napier Road, on the application of E. H. Sim, on behalf of G. E. Baker. *(Refusal.)*

Projecting shop at No. 132, Penwith Road, Earlsfield, on the application of T. Aldred, on behalf of Andrews. *(Refusal.)*

Buildings on the eastern and western sides of Harborough Road, Streatham, on the application of C. M. Quilter, on behalf of F. T. Wooding & Son. *(Refusal.)*

Buildings on the northern side of Little Somerset Street, City, to abut also upon the eastern side of Harrow Alley, and to be at less than the prescribed distance from the centres of the roadways of the said streets, on the further application of W. Stewart, on behalf of Millner & Jutsum. *(Consent.)*

Building on the western side of Sugden Street, Camberwell, to abut upon the southern side of Depot Street, and to be at less than the prescribed distance from the centres of the roadways of the said streets, on the application of A. C. Remnant, on behalf of S. Lamb. *(Refusal.)*

Building on the western side of Willow Vale, Uxbridge road, Hammersmith, at less than the prescribed distance from the centre of the roadway of such street, on the application of L. J. Williams, on behalf of W. I. Friend, *(Consent.)*

Buildings on the south-eastern side of Cassland Road, Victoria Park, Hackney, westward of Brookfield Road, on the application of G. H. Lovegrove, on behalf of G. S. Shaw. *(Refusal.)*

Retention of wooden fences or barriers across Biddulph Road and Ashworth Road, on the Paddington estate, Sutherland Avenue, Paddington. *(Consent.)*

Formation or laying out of a new street for carriage traffic to lead out of the south side of Blackshaw Road, Tooting, and in connection therewith the widening of a portion of Tooting High Street and two existing ways out of the south side of Blackshaw Road, on the application of Taylor & Kensitt to the Council. *(Consent.)*

Formation or laying out of a street for carriage traffic on a site on the northern side of the Mitre Bridge loop line of the London and North-Western Railway, Hythe Road, Willesden, on the application of J. E. Watts to the Council on behalf of E. Collins. *(Refusal.)*

Ten houses on the eastern side of Latimer Road, Hammersmith, with an irregular open space at the rear of the northernmost house, on the application of M. Minkler. *(Consent to modification.)*

Additional storey over the one-storey rear portion of the "Derby Arms" public-house. No. 45, Vauxhall Street, Kennington, on the application of W. M. Proudfoot, on behalf of the Forest Hill Brewery Company, Ltd, *(Consent to modification.)*

Addition at the first floor level at the rear of No. 161, Regent Street, Strand, on the application of Bywaters & Sons, Ltd., on behalf of Edwards & Sons. *(Consent to modification.)*

Addition to the Curzon Hotel, Curzon Street, Mayfair, upon the site of Nos. 23 and 24, Bolton Street, so far as relates to the construction of an additional storey, on the application of D. Cubitt, Nichols Sons & Chuter. *(Consent to deviation.)*

The Theatres and Music Halls Committee also reported the following applications:—

Drawings submitted by W. M. Brutton, showing how it is proposed to construct a pass staircase from the grand circle to the balcony of the Alhambra Palace of Varieties, Leicester Square, and to fix an iron door between the wardrobe room and the staircase. *(Consent.)*

Drawings submitted by E. Wingfield-Bowles of the electrical installation at the Play House, Northumberland Avenue. *(Consent)*

Drawing submitted by Vaughan, Brown & Cook of the fire-resisting curtain proposed to be erected at the Putney Hippodrome, Felsham Road, Putney. *(Consent.)*

Drawing submitted by H. & G. Taylor of a conservatory proposed to be erected adjoining the Sportsbank Hall, Sportsbank Street, Catford. *(Consent.)*

Drawing submitted by G. H. Dyball showing how it is proposed to isolate the main electric switches, fuses. &c., now fixed to the walls of the pit lavatory at the Tivoli Music Hall, Strand *(Consent.)*

Trade and Craft.

Substitutes for White and Red Lead.

We have received a sample of a paint which has just recently been placed on the market as a substitute for red lead paint. This substitute is made in France and contains no lead or poisonous substances. It can be used equally well on wood, stone, stucco, cement, plaster, iron and other metals. The advantages of "Grisol" paint (as it is called) do not ie solely in the fact that it is free from ead—it is unaffected by extremes of temperature and does not blister, peel or crack, and even firmly adheres to steam pipes, heating apparatus, boilers, &c. It will withstand a temperature of over 300 degs. Fahr. and has great resistance to he action of sea water, ammonia, alkalis and acids. "Grisol" paint dries quickly. It is thinned ready for use with ordinary boiled linseed oil or turpentine. A further point in its favour is that t will keep for any length of time without becoming solid, as red lead does when ground in linseed oil. It is much cheaper than red lead because it has far ess weight and a greater covering power it is even claimed that it has greater anti-corrosive value). "Grisol" paint is supplied in one colour, a deep French grey, which is distinctly pleasing and has ed it to be favoured for finishing as well as priming. As it preserves metals against corrosion and has this pleasing olour, it should be largely used for paintng iron and steelwork. A substitute for white and red lead mastics is also made. t is termed "Grisol cement." This, likewise, contains no poisonous substances nd is used for water, gas and steam joints. It can be kept in stock without hardening at any ordinary temperature, which is not the case with similar preparaions. Joints made with this cement withstand pressure, and the cement being omewhat elastic the expansion and conraction of the metal is allowed for, thus preserving the joints from rust. It is kneaded very easily and does not stick to he hand. Finally, it is much cheaper han lead mastics owing to its lighter pecific gravity. These preparations are upplied from the London offices of Messrs. Lefranc & Co., 27, Fetter Lane, E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated ill be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to The Editor" at latest by noon on Monday if intended for ublication in the following Wednesday's issue. Results f Tenders cannot be accepted unless they contain the name f the Architect or Surveyor for the work.

Chadwell Heath (Essex).—For (1) the enlargement of infants' school, and (2) erection of new mixed school to accommodate 300 children, for the Essex ducation Authority (Romford District Committee). Mr. James Kennedy, architect, 25, Bedford Row, London, W.C. :—

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 10. Barbrook.—*Erection of a classroom* at the Wesleyan Schoolroom, Barbrook. Persons desirous of tendering may see plans at the schoolhouse. Tenders to be sent to the Rev. F. A. Smyth, Lynton, on or before Nov. 10.

Nov. 10. Gerrans.—*Renovating the Wesleyan Chapel*, Gerrans. Specifications may be seen at Mr. Barnett's, chapel keeper, Gerrans. Endorsed tenders to be sent on or before Nov. 10, to J. Lobb, Pollaughan, Portscatho.

Nov. 10. Penzance.—*Erection of a wing* and other additions and alterations to the Riviera Palace Hotel, Penzance. The drawings and specification may be seen at the offices of O. Caldwell, F.R.I.B.A., architect, Victoria Square, Penzance. Sealed tenders, endorsed, "Tender for Riviera Palace Hotel," to be sent to the Secretary, Riviera Palace Hotel Co., Ltd., 6, Clement's Inn, Strand, London, on or before Nov. 10.

Nov. 12. Belfast.—*Erection of new shops* and warehouse in Smithfield for Simpson & Mitchell, glass and colour merchants. Plans and specifications may be had of Thomas Houston, architect and civil engineer, King's Court, Wellington Place, Belfast. Plans and specifications may be had of him on or before Nov. 12.

Nov. 12. Blackburn.—*Demolition of the buildings* Nos. 116a and 116b, King Street, including the purchase and removal of the materials. Tenders, endorsed "Buildings, King Street," to be sent to L. Beard, town clerk, Town Hall, Blackburn, not later than 12 o'clock at noon on Nov. 12.

Nov. 12. Westham.—*Erection of a new public elementary school* for infants at Westham. Persons desirous of tendering are requested to send their names and addresses to F. J. Wood, county surveyor of East Sussex, County Hall, Lewes, on or before Nov. 12, from whom full particulars can be obtained.

Nov. 12 Stourbridge.—*Erection of engineer's house* at Destructor Works, off Enville Street, for the U.D.C. Plan, specification, and conditions may be seen and any further information may be obtained upon application to F. Woodward, surveyor, the Town Hall, Stourbridge. Sealed tenders, endorsed "Tender for Engineer's House," may be sent to him not later than 12 noon on Nov. 12.

Nov. 12. Ilford.—*Roofing-in with reinforced concrete* of the septic tanks, &c., at the Outfall Works, Loxford Lane, Ilford, for the R.U.D.C. Plans and specifications may be seen, and form of tender obtained on payment of a deposit of £2 2s., on application to H. Shaw, A.M.I.C.E., engineer and surveyor to the Council, Town Hall, Ilford, during the usual office hours. Sealed tenders, endorsed "Tender for Concreting," must be sent to J. W. Benton, clerk to the Council, Town Hall, Ilford, on or before noon. Nov. 12.

Nov. 12. Ashington, New Hirst.—*Erection of new Council school*, to accommodate 680 scholars together with caretaker's dwellinghouse and cookery centre, at Ashington, New Hirst. Contractors desirous of tendering for the work should forward particulars of their name and address to C. Williams, secretary to the Education Committee, Pearl Buildings, Newcastle-on-Tyne, not later than Oct. 27, together with a deposit of £2 2s. Plans of the work may be inspected at the Committee's Offices, and tenders endorsed "Tender for New Hirst Council School," must be forwarded to the Secretary not later than 4 p.m. on Nov. 12.

Nov. 12. Epsom.—*Erection of two acute blocks* and the re-building of a nurses' block, at the Manor Asylum, Epsom, Surrey, for the L.C.C. Instructions for tender, and form of tender and contract, with specification, can be obtained from the Clerk of the Asylums Committee, 6, Waterloo Place, London, S.W., upon payment of £5, and the plans may be inspected at the office of the Asylums Engineer, at 6, Waterloo Place, between the hours of 10 a.m. and 4 (except Saturday), and on that day between the hours of 10 and 1 p.m. Tenderers can also obtain from the engineer permission to view the site. Tenders must be on the printed form, accompanied by the form of contract and schedules thereto and forms of bond, and must be enclosed in an envelope, sealed and endorsed "Tender for New Buildings, Manor Asylum," and delivered at the office of the committee not later than noon on Nov. 12. The contractor will have to enter into bonds in the sum of £700 with approved sureties, as security for the performance of the contract. Fair wages clause.

Nov. 13. Gosforth.—*Erection of stables* at the rear of the Council Chambers, High Street, for the U.D.C. Plans and specification may be seen, and all information obtained at the office of G. Nelson, engineer and surveyor to the Council, Council Chambers, Gosforth, to whom application should be made for quantities. Tenders endorsed "Erection of Stables," to be sent to R. S. Holmes, solicitor, clerk to the Council, Council Chambers, Gosforth not later than Nov. 13.

Nov. 13. Maldon.—*Alterations to North Fambridge school.* Plan and specification can be seen at the office of F. H. Bright, clerk to the Maldon Local Advisory Sub-Committee, 53, High Street, Maldon, between the hours of 10 and 4 any working day except Saturday. The tender accepted must be subject to the approval of the Local Government Board and the Essex County Council. Sealed tenders, endorsed "Alterations to North Fambridge School," to be delivered to the clerk not later than Nov. 13.

Nov. 15. Belfast.—*Construction of an underground convenience* in Donegal Square North, for the County Borough of Belfast. Drawings, specification, and form of tender may be obtained in the City Surveyor's office on payment of £1 1s. Tenders, endorsed "Underground Convenience," to be lodged with S. Black, town clerk, before 10 o'clock on Nov. 15.

Nov. 15. Hamworthy.—*Erection of additional buildings* and alterations to the schools at Hamworthy. Plans and specifications can be seen at the office of H. F. J. Barnes, architect and surveyor, Towngate Street, Poole. Tenders to be delivered on or before Nov. 15, addressed to C. Lisby, secretary to the Education Committee, Fish Street, Poole, and endorsed "Tender Schools, Hamworthy."

Nov. 15. Crumpsall.—*Alterations of a part of* the Workhouse, Delaunay's Road, Crumpsall, in connection with the provision of store rooms, for the Guardians of the Prestwich Union. Specifications may be obtained at the Workhouse between the hours of 10 and 12 noon, on application to the workhouse master Mr. Jones. Tenders endorsed "Tender for Store Rooms" to be addressed to E. W. Ogden, clerk to the Guardians, Union Offices, Cheetham Hill Road, Manchester, and delivered by 10 a.m. on Nov. 15, on which day they will be opened by the Guardians.

Nov. 19. Cardiff.—*Erection of new schools* for 448 children off Clarence Road, Cardiff, for the Rev. Gilbert Heaton, M.A., and the managers of St. Mary's National Schools, Cardiff. Plans and specifications may be seen and quantities obtained of Veall & Sant, architects, Cardiff. Sealed and endorsed tenders to be sent to them not later than Nov. 19.

Nov. 20. London, E.—*Erection of an additional furnace* in connection with the dust-screening apparatus at Marian Square, for the Council of the Metropolitan Borough of Bethnal Green. Plans and specifications can be seen, and form of tender obtained, upon application to the Borough Engineer and Surveyor at the Town Hall, Church Row, Bethnal Green, any day between the hours of 10 a.m. and 4 p.m. Fair wages clause. Tenders, sealed and endorsed "Furnace," must be delivered to R. Voss, town clerk, Town Hall, Bethnal Green, E., not later than 12 noon on Nov. 20.

Nov. 20. London, S.E.—*Erection of a mortuary*, Coroner's Court, and other buildings on a site in Baildon Street and Watson Street, Deptford, according to the drawings and specifications prepared by H. T. Bonner, A.R.I.B.A., to be seen at the Town Clerk's office, Town Hall, New Cross Road, between 10 and 4 o'clock, Saturdays between 10 and 1. Bills of quantities prepared by A. Crocker, together with the conditions of contract, may be obtained from V. Orchard, town clerk, Town Hall, New Cross Road, S.E., on payment of £2 2s. Persons desirous of tendering must send in their names to the Town Clerk on or before Nov. 17. Tenders, sealed and endorsed "Mortuary and Coroner's Court," must be delivered to the Town Clerk in accordance with the Council's regulations as to the receipt of tenders, at the Town Hall not later than 4 p.m. on Nov. 20. Fair wages clause.

Nov. 21. Liskeard.—*Erection of a new secondary school* at Liskeard. Plans and specifications may be seen at the office of J. Saneom, Architect to the Committee, Liskeard, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders, on official forms, which may be had from the architect, are to be sent to F. R. Pascoe, secretary, Education Office, Truro, on or before Nov. 21.

Nov. 21. Thirsk. — *Proposed alterations to Thirsk Infants' Council School* for the Education Committee. Contractors desirous of submitting an estimate for the whole of the several works in connection with this may obtain forms of tender and inspect plans and specification at the office of C. Moore, Millgate, Thirsk, or at the County Hall, Northallerton, during ordinary office hours. Tenders to be delivered to D. Smith, secretary, County Hall, Northallerton, not later than Nov. 21, sealed and endorsed "Tender for Alterations, Thirsk Infants' School."

Nov. 22.—Priestwood. — *Building of a new school* for 200 scholars at Priestwood, Easthampstead, near Bracknell, Berks. Builders desirous of tendering are required to send in their names to the Secretary of the Education Committee, The Forbury, Reading, together with a deposit of £3 3s., for bills of quantities. Plans, specification, and form of contract will be open for inspection at the Education Secretary's office between the hours of 10 and 5. Tenders must be delivered at the office of the Education Secretary, on the form and in the envelope provided, not later than the first post on Nov. 22.

Nov. 24. Hyde.—*Erection of the Leigh Street Council School* to accommodate 1,200 children. Plans and specifications may be seen at the office of J. Lindley, architect, Town Hall Chambers, Hyde. Bills of quantities, forms of tender, &c., may be obtained from S. Ashford, secretary, Education Offices, Hyde, on a deposit of £3 3s. Sealed tenders, on the official forms and enclosed in the envelopes provided, must be delivered to the Secretary not later than Nov. 24. Fair wages clause.

Nov. 24. Barnwood.—*Erection of a new block* to accommodate about 170 female patients, at the Second County Asylum, Barnwood, near Gloucester. Bills of quantities and forms of tender can be obtained from Giles, Gough & Trollope, architects, 28, Craven Street, Charing Cross, London, W.C., on payment of £3 3s. Plans and specifications can be seen at the architects' office, 28, Craven Street. aforesaid, and at Wotton Asylum Gloucester. Sealed tenders, on forms supplied, are to be delivered to J. Thompson, clerk to the visitors, Wotton Asylum, Gloucester, on or before Nov. 24.

Dec. 1. Roscrea, Co. Tipperary.—*Erection of a new bacon factory* at Roscrea, Co. Tipperary, for the directors of the Roscrea Bacon Factory, Ltd. (1) Excavations, foundation, concrete floors and walls. (2) Corrugated iron buildings or alternatively buildings with Belfast felt roofing. Plans, specifications, and forms of tender may be obtained on payment of a deposit of 40s. Tenders to be submitted by Dec. 1.

No date. Seaton Carew.—*Erection of buildings &c.*, and for supply of materials in connection with new Smelting Works near Seaton Carew for the Central Zinc Company, Ltd. Particulars will be furnished only on written application to H. M. Ridge, general manager, Seaton Carew.

No date. Tanygarreg.—*Repairs and improvements* to the Tanygarreg Council school. Drawing and specification can be seen and full particulars obtained on application to the headmaster or G. D. Lewis, M.S.A., county architect, Aberystwyth,

ENGINEERING.

Nov. 13. Long Ditton.—*Construction of six filter beds*, a service reservoir and other contingent works at Long Ditton, for the Metropolitan Water Board. Forms of tender and contracts, with specification, &c., may be obtained on application to the engineer, Brixton Hill, S.W., on production of an official receipt for the sum of £5, which sum must first be deposited with the comptroller, at the Board's Central Offices, Savoy Court, Strand, W.C. Tenders, enclosed in sealed envelopes, addressed to the Clerk of the Board, Metropolitan Water Board, Savoy Court, Strand, W.C., and endorsed "Tender for Filter Beds and Reservoir, Long Ditton," must be delivered at the offices of the Board, not later than 10 a.m. on Nov. 13.

Nov. 17. Oakwood, near Port Talbot.—*Heating of the Council schools* at Oakwood (near Port Talbot), Crynant and Onllwyn (near Neath), for the Glamorgan C.C. Plans and specification of the work may be obtained of T. M. Franklen, clerk of the County Council, Glamorgan County Council offices, Westgate Street, Cardiff. Fair wages clause. Tenders, made out on the form supplied, are to be delivered to the Clerk of the C.C. not later than Nov. 17, marked outside "Tender for Heating Oakwood" or "Crynant School," &c., &c., as the case may be.

Tenders must be made on forms, copies of which, with specification, can be obtained of W. V. Constable, secretary, Gloucester House, 2, 3 and 4, Bishopsgate Street Without, London, E,C., on payment of £1 1s., which will not be returned. Tenders are to be delivered by noon on Nov. 20.

PAINTING AND PLUMBING.

Nov. 14. Harrogate.—*Colouring, whitewashing and painting* the Royal Bath Hospital and Rawson Convalescent Home, Harrogate. Specifications of work may be seen daily at the Hospital, between 1 and 4 p.m. Tenders to be sent in by noon Nov. 14, to B. Shaw, secretary.

Nov. 23. Salford.—*Painting two bridges* over the river Irwell. The specification, form of tender, and all information may be obtained at the Borough Engineer's office. Tenders, endorsed "Painting Bridges," addressed to the Chairman of the Building Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 10 a.m. on Nov. 23.

ROADS AND CARTAGE.

Nov. 8. Stretford.—*Asphalting Seymour Park School Playground.* Specifications, plans and particulars will be furnished by E. Woodhouse, architect, 88, Mosley Street, Manchester, on payment of £1 1s. Tenders must be addressed "Chairman of the Sites and Buildings Committee," and delivered at the Council's Offices, Old Trafford, not later than Nov. 8, endorsed "Asphalting."

Nov. 17. Hale.—*Supply and laying* of about 532 super. yards of annealed concrete paving, for the U.D.C. Plans and specifications can be seen and bills of quantities and forms of tender may be obtained on the payment of a deposit of 10s. 6d. at the office of F. E. Boaz, Council's surveyor, any day during the usual office hours. Tenders and priced bills of quantities are to be received by J. G. Whyatt, clerk to the Council, Council Offices, Hale, Cheshire, not later than noon on Nov. 17, in sealed envelopes, which will be supplied.

Nov. 17. Lee.—*Sewering, levelling, paving*, flagging, and channelling of the following streets within the district of Lees, namely: Burton Street, that part of Thomas Street extending from the paved portion thereof to Nether Lees, a distance of 125yds. or thereabouts; Sunny Bank Road, from Thomas Street to Damfield, a distance of 136yds. or thereabouts; Acorn Street, Chapel Street, Ancoats Street, Benyon Street, from Saint John Street to High Street; Albert Street, Nelson Street, Dawson Street, Mellor Street, Prince's Street, Cross Street, Nether Lees, and that part of New Street extending from High Street to the north side of Owl Street, a distance of 176yds. or thereabouts; or for any one or more of such streets, but a separate sum must be named for each street and for the providing of all necessary materials required for carrying out the several works. Copies of the specifications and bills of quantities and all further particulars may be obtained on application to A. H. Mountain, A.M.I.C.E., engineer, Prince's Chambers, 16, John Dalton Street, Manchester, on payment of £1 1s., and at whose office plans and sections may be seen. The person or persons whose tender is accepted will be required to find sufficient security for the satisfactory completion of the work. Sealed tenders, made out on the form provided by the engineer and endorsed "Tender for Street Works," must be sent or delivered to J. W. Smith, J.P., Chairman of the Council, 30, Thomas Street, Lees, not later than Nov. 17.

SANITARY.

Nov. 9. Uddingston.—*Construction of an outfall sewer*, about one mile in length, from the junction of the Myres Burn with the Powburn to Powburn Toll. Plans may be seen, and copies of the specification and schedule of measurement obtained, at the office of W. L. Douglass, C.E., district engineer, district offices, Hamilton, on payment of £1. An assistant engineer will meet intending contractors at Uddingston West Station (North British Railway) at 10.22 a.m. on Oct. 25. Sealed tenders, endorsed on outside "Tender for Outfall Sewer," must be lodged with the Clerk to the Subcommittee, J. Cormack, Bank of Scotland, Uddingston, not later than 10 a.m. on Nov. 9.

Nov. 10. Swindon.—*Supply and delivery to the G.W.R. Station*, Swindon, of a cast-iron public urinal in accordance with the plan and particulars to be obtained on written application to H. J. Hamp, borough surveyor, Town Hall, Swindon. Tenders, endorsed "Public Urinal," to reach R. Hilton, town clerk, by 12 noon on Nov. 10.

Nov. 10. Woodsetts.—*Sewerage and sewage disposal works* in the parish of Woodsetts for the R.D.C. of Kiveton Park. The contract comprises the laying of about 1,700 yards of 6-in. and 9-in. pipe sewers, together with manholes and other appurtenant work, and the construction of small septic tanks and percolating filters. Plans may be seen, and specifications, bills of quantities and forms of tender obtained on application to J. P. Evans, surveyor, Kiveton Park, N. Sheffield, on payment of £2 2s. The successful contractor will be required to enter into a bond with approved sureties for the due performance of his contract. Sealed and endorsed tenders to be sent to J. S. Whall, solicitor, clerk to the Council, Bridge Street, Worksop, Notts., on or before Nov. 10.

Nov. 13. Cheshunt.—*Construction of a surface water sewer* in Longfield Lane, consisting of about 665yds. lin. armoured concrete tubes and about 460yds. lin. stoneware pipes, together with street gullies and inspection chambers; also the erection of a concrete retaining wall and other incidental works for the U.D.C. Plans and specifications may be seen and quantities and forms of tender obtained of R. H. Jeffes, Assoc.M.I.C.E., engineer and surveyor, Manor House, Cheshunt. Sealed tender to be delivered in official envelope, which will be supplied, on or before Nov. 13.

Nov. 13. Hailsham.—*Construction of about 410yds. run of 9-in. pipe sewers*, with five manholes and the necessary works in connection therewith, for the R.D.C. The drawings may be seen at the Council Offices between 10 a.m. and 4 p.m. on weekdays (except Saturdays, 10 a.m. to 1 p.m.), and copies of the specification, bill of quantities, and form of tender may be obtained on the deposit of 10s. Sealed tenders, endorsed "Tender for Polegate Sewerage," are to be sent to E. Catt, clerk, Council Offices, 17, London Road, Hailsham, not later than Nov. 13.

Nov. 13. Bedworth.—*Private drainage work* in the parish of Bedworth for the Foleshill R.D.C. Specification may be seen, and form of tender obtained, on application to A. E. Newey, surveyor, Council Offices, Foleshill, between the hours of 9 and 10 a.m. Endorsed tenders to be sent to A. P. Oswin, clerk, Council Offices. Littleheath, Foleshill, so as to be received not later than first post on Nov. 13.

Nov. 14. Leeds.—*Two slip sets of combined engines* and centrifugal pumps for pumping crude sewage from the main sewer into prepipitation tanks at Knostrop Sewage Works for the Sewerage Committee. Copies of drawing, conditions of contract and form of tender may be obtained at the office of G. A. Hart, engineer, Municipal Buildings, Leeds, on deposit of *bona fide* tender and all documents supplied to the tenderer. Tenders to be addressed to the Town Clerk, Town Hall, Leeds, and endorsed "Tender for Pumping Engines, Knostrop," not later than 10 a.m. on Nov. 14.

Nov. 19. Barnsley.—*Contract No. 2. Providing and fixing revolving sewage sprinklers*, distributors, and automatic discharging apparatus, together with all the necessary castings and fittings to the same, at the proposed continuous filters to be constructed near Lund Lane, within 3 miles of Barnsley, for the Council. Further particulars, with a plan of the site, may be obtained on personal application to J. H. Taylor, M.Inst.C.E., borough surveyor (engineer for the scheme), Manor House Offices, Barnsley, to whom tenders, properly sealed and endorsed, are to be delivered not later than 10 a.m. on Nov. 19.

Nov. 19. Barnsley.—*Contract No. 3. Construction of collecting and detritus tanks*, septic tanks, bacterial filters, conduits, and other works required to be done at the proposed sewage works, which are to be constructed near Lund Lane, about 3 miles east of Barnsley, for the Town Council. Drawings, specifications, and bills of quantities may be obtained on payment of £10 to A. Newsum, borough accountant, Barnsley, and tenders, properly sealed and endorsed, are to be delivered to J. H. Taylor, M.Inst.C.E., borough surveyor (engineer for the scheme), Manor House Offices, Barnsley, not later than 10 a.m. on Nov. 19.

Nov. 19. Glasgow.—*Construction of Sewer No. 6* (being a 3-ft. by 2-ft. brick sewer), extending along Dumbreck Road from Manor Road to Fleurs Avenue, a distance of about 825 lineal yards. Plans, specifications and working drawings may be seen, and specifications and schedule of quantities and forms obtained, on application to the City Engineer, City Chambers, 64, Cochrane Street, Glasgow, on payment of a fee of £5 5s. Sealed offers, marked outside "Tender for Sewer No. 6," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than Nov. 19. The resident engineer will meet intending offerers in Paisley Road, at Ibrox Station, at 11 on Nov. .

Nov. 20. Milton, Hants.—*Provision of a sewerage system* for the parish of Milton, Hants, for the R.D.C., of Lymington. The specification is for the following works:—For the construction of about 1,180yds. of 6-in., 4,900yds. of 9-in., and 1,250yds. of 12-in. stoneware pipe sewers, and about 40yds. of 9-in. and 150yds. of 12-in. cast-iron sewers, all necessary manholes and flushing chambers, and for the erection of 13 ventilating columns; for the construction of sewage-disposal works, comprising of grit chamber, septic and storage tanks, 12 contact beds, and a storm-water overflow drain and filter bed. Copies of the specification and bill of quantities can be obtained and plans seen at the offices of the Clerk to the R.D.C., Lymington, Hants, or at the offices of H. C. H. Shenton, engineer, of the firm of Messrs. Anson & Shenton, of 28, Victoria Street, Westminster, S.W., on payment of a cheque of £5. Tenders must be received by J. D. Rawlins, clerk, at the office of the Council, Lymington, Hants, before 11 a.m. on Nov. 20.

Dec. 19. Herne Bay.—*Construction of about $3\frac{1}{4}$ miles of brick and concrete and pipe sewers*, with all the necessary manholes, ventilators, and flushing arrangements, the construction of a pumping station, cottage, and buildings, and the provision of pumping machinery for the U.D.C. Plans and specification of the works may be seen and the form of tender obtained at the office of B. Latham, M.Inst.C.E., Parliament Mansions, Victoria Street, Westminster, engineer for the works, or at the office of F. W. J. Palmer, surveyor to the Council, at his office at Herne Bay. The quantities of the several works have been taken out by C. E. Bruges, A.M.I.C.E., 1, Victoria Street, Westminster, and may be had on application either to the engineer or surveyor on deposit of £10. Sealed tenders, on the form supplied attached to the quantities, endorsed "Tender for Sewerage Works," are to be delivered at the office of J. Jubb, clerk to the U.D.C., at Herne Bay on or before noon of Dec. 19.

MISCELLANEOUS.

Nov. 17. Accrington.—*Supply of manganese steel points*, crossings, special track work, tie-bars, fish bolts, &c., for the Borough Corporation Tramways. Specifications, drawings, forms of tender and further particulars may be obtained on application to W. J. Newton, Assoc.M.Inst.C.E., borough engineer, Town Hall, Accrington, on payment of a deposit of £2 2s. Sealed tenders, endorsed "Tramway Points and Crossings" or "Tie-Bars and Fish Bolts," as the case may be, to be delivered to A. H. Aitken, town clerk, Town Hall, Accrington, not later than Nov. 17.

Nov. 19. Dublin.—*Supply of general stores*, including car fittings, iron, steel, castings, oils, paints, glass, brushes, ironmongery, electric supplies, timber, &c., for the year ending Dec. 31, 1907, for the Dublin United Tramways. Forms of tender (price 2s. each), conditions, and all information can be obtained, and patterns seen, at the Secretary's Office, 9, Upper Sackville Street, until Nov. 12. Tenders, sealed and marked on the outside "Tenders for Stores," and addressed to the Chairman, to be lodged with R. S. Tresilian, secretary, on or before Nov. 19.

Nov. 19. Dublin.—*Supply of the following stores* for the Directors of the Midland Great Western Railway of Ireland Company. The contracts to commence from Jan. 1 next, and terminate on Dec. 31, 1907:—(4) brass and copper tubes, plates, sheets, &c.; (5) brass cocks and gas fittings; (6) bricks, flags, tiles, &c.; (11) cements; (13) copper, tin (ingots), lead, gunbarrel, &c.; (15) glass; (17) iron castings; (18) do. Staffordshire bars, plates, wires, &c.; (19) do. Yorkshire do.; (20) ironmongery; (26) springs, steel and files; (27) steel tyres, axles and plates; (28) timber, &c. Forms of tender can be obtained, on payment of 6d. each, from the Storekeeper, General Stores Department, Broadstone Station, Dublin. Patterns and samples can be inspected at the same place on and after Nov. 1, between the hours of 10 a.m. and 4 p.m., except Saturdays. Contractors cannot be allowed to tender to supply goods to their own patterns, nor can the company's patterns be sent away for inspection. The directors will not consider any tender unless furnished on the company's forms; nor any tender in which any alteration of the form has been made. The tenders to be sent in by post, sealed and endorsed on the envelope, "Tender for Stores, Form No. ...," and addressed to "The Chairman, Broadstone Station, Dublin," so as to reach him on or before 10 a.m. on Nov. 19.

Nov. 26. London.—*Supply during 1907 of the following stores* for the L.G. Omnibus Company, Ltd.:—(a) timber; (b) ironmongery, coachmakers', engineers', saddlers', and farriers'; (e) oil, glass, grease and sundries; (k) building materials; (l) gas and water fittings; (m) enamelled iron plates. The schedules will be ready Nov. 12, and may be obtained at the company's coach factory, North Road, Caledonian Road, N., on payment of 2s. 6d. each, where samples also will be on view Nov. 14, 15 and 16, between the hours of 10 a.m. and 5 p.m. Contractors are requested to call and examine the samples before tendering. Sealed tenders, endorsed "Tender for Stores," should be addressed to the Directors, 6, Finsbury Square, E.C., not later than noon, Nov. 26.

TOO LATE FOR CLASSIFICATION.

Nov. 12. Cleethorpes-with-Thrunscoe.—*Construction of a small mortuary* and alterations to the foreman's office to form Inquest-room, for the U.D.C. Forms of tender may be obtained and plans and specifications may be seen on application to E. Rushton, engineer and surveyor to the Council, Surveyor's Office, Council House, Cleethorpes, between the hours of 9 and 12 in the morning. Sealed tenders, addressed to the Chairman of the General Purposes Committee, and endorsed "Tender for Mortuary," to be sent in to the office of the clerk to the Council not later than 12 noon on Nov. 12.

Nov. 12. Corbridge.—*Erection of out offices*, boundary fences, and the construction of a drainage system at a temporary iron school building, which it is proposed to erect at Corbridge for the Education Committee. Copies of specification and forms of tender for the work may be obtained on application to C. Williams, secretary to the Education Committee, Pearl Buildings, Newcastle-upon-Tyne, and a plan of the proposed work can be inspected at the offices of the committee at the same address, or at the office of the Corbridge Parish Council, situate in Middle Street, Corbridge, any day between the hours of 10 a.m and 4 p.m. Tenders, endorsed "Tender for Boundary Fencing, &c.," must be forwarded to Mr. Williams not later than 4 p.m. on Nov. 12.

Nov. 13. London.—*Reconstruction of the bridge* carrying Hampstead Road over the London and North-Western Railway, near Euston Station, in the borough of St. Pancras, in the Administrative County of London. Persons desiring to submit tenders may inspect the drawings and obtain the specifications, bills of quantities, form of tender, and other particulars upon application to the chief engineer, M. Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of the sum of £3. Full particulars may be obtained on application at the County Hall, Spring Gardens, previously to the payment of the fee for the specification, &c. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall in a sealed cover, addressed to "The Clerk of the London County Council, Spring Gardens, S.W.," and marked "Tender for Reconstruction of Bridge carrying Hampstead Road over the London and North-Western Railway." No tender will be received after 10 a.m. on Nov. 13.

Nov. 14. Pontypridd.—*Erection of Park School*, Treforest, for the accommodation of 300 boys, 300 girls, and 300 infants, together with cookery and manual instruction centres. Plans and specification can be seen at the office of P. R. A. Willoughby, A.M.I.C.E., surveyor to the Council, and from whom bills of quantities can be obtained on payment of £3 3s. The bill of quantities must be sent in under seperate cover, with the name of the person tendering on the outside, under seal, to the Surveyor, and will be returned to him unopened in the event of his tender not being accepted. Tenders, on the prescribed form, to be sent under seal to D. Milton Jones, secretary, Municipal Buildings, Pontypridd, not later than Nov. 14.

Nov. 17. Worcester.—*Additions, &c., to the electricity generating station* in the Hylton Road, for the Electricity Committee of the Corporation. Persons desirous of submitting tenders must forward their names and addresses to the City Architect, Worcester Chambers, Pierpoint Street, Worcester, on or before Nov. 8. The plans and specifications may be inspected and other particulars obtained of H. Rowe, city architect, Worcester, where tenders (on forms to be supplied) are to be delivered on or before Nov. 17. Fair wages clause.

Nov. 19 Bristol.—*Supply during the year 1907* the following tools and stores:—*Castings, *ironmongery, cement, drain pipes, paints, *oils and candles, for the Sanitary and Improvement Committee of the Corporation. Specifications and forms of tender may be obtained at the offices of the City Engineer, 63, Queen Square, on payment of 10s. Local tenders only will be accepted for those marked *. Tenders must be sent in the envelopes provided to 63, Queen Square not later than 1 p.m. on Nov. 19.

Nov. 19. Cupar.—*Contract No. 1: Construction of a storage reservoir*, the laying and jointing of 4 and 3-in. diameter cast-iron pipes, the fitting of valve, hydrants, and other relative works, for the Fife C.C. Drawings may be seen and copy of specification and schedule of quantities and form of tender obtained from Bruce, Proudfoot, & Macrae, civil engineers, 67, Crossgate, Cupar, upon payment of £2 2s. Contractors will be shown over the proposed line of pipes, &c., upon giving one day's notice to the engineers. The form of tender, specification, and schedule of quantities must be delivered in a sealed cover to W. D. Patrick, district clerk, County Buildings, Cupar, marked "Kettle Contract No. 1," not later than 10 a.m. on Nov. 19.

No date. Wolvey.—*Erection of farm buildings* at Wolvey, for H. F. J. Coape-Arnold, Esq., of Wolvey Hall, Hinckley. Bills of quantities may be obtained upon application to T. F. Tickner, M.S.A., architect, High Street Chambers, Coventry.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—adjudication.]

DURING THE WEEK ending November 2nd thirty-three failures in the building and timber trades in England and Wales were gazetted.

G. HORN, builder, Enfield. R.O., Oct. 22.

D. JONES, painter, Barmouth. R.O., Oct. 22.

T. MAY, contractor, Plymouth. R.O., Oct. 23.

H. C. GOSS, builder, Torquay. R.O., Oct. 26.

D. T. CARTER, builder, Chingford. R.O., Oct. 22.

H. SCOTT, timber merchant, Derby. R.O., Oct. 25.

T. R. BRICE & CO., builders, Chingford. R.O., Oct. 22.

WILKINSON BROTHERS, builders, Palmers Green. R.O., Oct. 22.

A. BARTLEMAN & SON, builders, Stow-on-the-Wold. R.O., Oct. 23.

W. SIGGENS, builder, Washington. P.E., Newcastle-on-Tyne C.C., Nov. 22, at 11.

J. HUGHES, builder and contractor, Conway. Liabilities, £179; deficiency, £58.

O. ODELL, builder and contractor, Wheathampstead. Liabilities, £1,852; assets £462.

J. REES, builder and contractor, Llandebie. P.E., Guildhall, Carmarthen, Nov. 7, at 12.

J. HARLOW, builder, Burton-on-Trent. Gross liabilities, £12,821; £3,346 expected to rank; net assets, £1,960.

H. PEMBERTON, builder and contractor, Derby. First meeting, O.R.'s, Derby, Nov. 7, at 11. P.E., Derby C.C., Nov. 13, at 11.

JOSEPH G. FIRBANK, LTD., railway contractors, London. Gross liabilities, £143,611; £81,354 expected to rank; assets nil.

J. HARLOW, builder, Burton. Gross liabilities, £12,822; £3,347 expected to rank; assets £1,960; deficiency, £1,387.

HICKS & SON, builders, Bedminster. First meeting, O.R.'s, Bristol, Nov. 14, at 11.30. P.E., Guildhall, Bristol, Nov. 30, at 12.

W. TAYLOR & CO., builders and contractors, Tamworth. P.E., Birmingham C.C., Nov. 28, at 2. R.O., Oct. 9 (amended notice).

J. E. HARDWICK, joiner and builder, Spital. First meeting, O.R.'s, Liverpool, Nov. 7, at 2.30. P.E., Birkenhead C.C., Nov. 13, at 11.

T. WILSON, builder, Folkestone. First meeting, O.R.'s, Canterbury, Nov. 8, at 9.15. P.E., Guildhall, Canterbury, Nov. 8, at 10

G. FAWLEY & SONS, plumbers, Halifax. First meeting, O.R.'s, Halifax, Nov. 7, at 2.30. P.E., Halifax C.C., Nov. 12, at 2. R.O., Oct. 24.

F. O. FARRELL, builder and contractor, Leeds. First meeting, O.R.'s, Leeds, Nov. 7, at 11. P.E., Leeds C.C., Nov. 13, at 11. R.O., Oct. 25.

J. RINGROSE, builder and contractor, Stanningley. First meeting, O.R.'s, Bradford, Nov. 7, at 3. P.E., Bradford C.C., Nov. 21, at 10. R.O., Oct. 25.

New Companies.

BARKER & JONES, manufacturers of bricks, tiles, &c. Capital: £3,005.

LATIN COUNTRIES CEMENT CO., 139, Cannon Street, E.C. Capital: £65,000.

THOMAS TATTERSALL, builder and contractor, Manchester Road Saw Mills, Haslingden. Capital: £5,000.

COPINGERS, to acquire the business of electrical engineers and contractors carried on as Copinger & Co., 43, Lower Mosley Street, Manchester. Capital: £2,000.

WHITMORE & SON, timber merchants, Wharf Saw Mills, Fordham Road, Bury St. Edmunds. Capital: £5,000.

J. T. TUSTING & SONS, dealers in bricks, tiles, and other building materials, Cambridge and Norwich. Capital: £3,000.

SOME IMPORTANT BOOKS ON
MODERN
Architectural Practice

JUST READY.—Imperial 8vo. Cloth Gilt. Price **21/-** net. Containing 284 pages, with 274 Illustrations, comprising the plans, elevations, and constructive and engineering details of numerous modern examples.

PUBLIC BATHS AND WASH-HOUSES
A TREATISE ON THEIR PLANNING, DESIGN, ARRANGEMENT, AND FITTING.
Having Special Regard to the Acts Arranging for their Provision.
With Chapters on Turkish, Russian, and Other Special Baths, Public Laundries, Engineering, Heating, Water Supply, &c.
By A. W. S. CROSS, M.A., F.R.I.B.A.

This treatise has been prepared with the object of providing Architects and others with a practical and reliable work upon a subject with which they may be called upon to deal, and upon which there is at present no really modern comprehensive volume. The Author has, for purposes of comparison and study, obtained from well-known colleagues and professional friends a large number of plans of Bath establishments recently erected in London and elsewhere, and has included some examples of his own work in this special branch of architectural practice. These are reproduced to a good scale, the plans of all floors are frequently accompanied by full sections and details, given to the same scale, thus forming a monograph of each building illustrated. The subject of fittings in connection with Public Baths is fully dealt with and illustrated in detail. The construction is shown of galleries, slipper-baths, dressing-boxes, and the compartments of the public wash-house. Specifications are given for fittings in connection with the water supply, the establishment laundry, and the boiler-house, engine and pump rooms, &c. Notes are added on administration, and the cost of construction and maintenance.

JUST READY.—An Important Book for all interested in the Development of Building Estates. Containing 44 Plates of Exterior and Interior Views and large-scale Plans, reproduced from special Photographs and the Author's drawings. Large 4to (13¾in. by 10½in.), handsomely bound in Art Linen Gilt. Price **16/-** net.

MODERN SUBURBAN HOUSES
A SERIES OF EXAMPLES ERECTED AT HAMPSTEAD, BICKLEY, AND PURLEY, FROM DESIGNS
By C. H. B. QUENNEL, Architect.

The houses illustrated in this volume are of the best type of suburban house, usually semi-detached, and of limited frontage—a type upon which very little information has been published, although it is one of which the better class estates are largely composed. Skilfully planned, of quiet, refined design and financially successful *(all the examples having been built for sale, and sold)*, they clearly demonstrate that architecture in the suburbs, even when controlled by speculative builders, may be as refined and beautiful as in the country.

NOW PUBLISHED.—Second Edition, revised, and considerably enlarged, with many new plans and other illustrations containing 550 pages, with 450 Illustrations, comprising the plans of 95 Schools, with numerous perspective Views, Constructive Detail, and Fittings. Large Imperial 8vo. Cloth Gilt. **25/-** net.

MODERN SCHOOL BUILDINGS:
ELEMENTARY AND SECONDARY.
A TREATISE ON THE PLANNING, ARRANGEMENT, AND FITTING OF DAY AND BOARDING SCHOOLS.
Having special regard to School Discipline, Organisation, and Educational Requirements.
With chapters on the Treatment of Class-Rooms, Lighting, Warming, Ventilation, and Sanitation.
By FELIX CLAY, B.A., Architect.

"Mr. Clay's book is an eminently practical one, illustrated by actual executed examples. . . . . It is full of valuable information carefully arranged, and it should at once take rank as the standard authority on the subject."—*The Architectural Review.*

Containing about 300 pages, with 226 Illustrations, including Plans and Views of Important Examples by leading English and Foreign Architects. Imperial 8vo. Cloth Gilt, **21/-** net.

RESIDENTIAL FLATS OF ALL CLASSES
INCLUDING ARTISANS' DWELLINGS.
A PRACTICAL TREATISE ON THEIR PLANNING AND ARRANGEMENT.
Together with chapters on their History, Financial Matters, &c.
By SYDNEY PERKS, F.R.I.B.A., P.A.S.I.

The object of this is to illustrate and describe all classes of Flats, from the poor man's tenement of one room to the most luxurious and expensive suite in London, Paris, or New York.

"Altogether it is a book which is not only unique in architectural literature, but is one of which every page has a practical tendency. It can, therefore, be a source of profit to architects and to builders, as well as to speculators."—*The Architect.*

Second Edition, revised and enlarged. Large 8vo. Cloth Gilt. Price **8/6** net.

THE PRINCIPLES OF PLANNING
AN ANALYTICAL TREATISE FOR THE USE OF ARCHITECTS AND OTHERS.
By PERCY L. MARKS, Architect.

Illustrated by 150 Plans of various Types of Buildings, chiefly of Works by eminent modern Architects.

"This is a book which treats of its subject as a whole comprehensively and yet minutely. For a single-handed attempt to grapple with such a widely extending subject, the author has really done very well. His range of interests is wide; his choice of matter judicious. Labour he has clearly not stinted, and his success in arranging this large amount of material is worthy of much praise."—*The Builder.*

JUST READY.—150 pages, with 1,100 clear and practical Illustrations. Large 8vo. Cloth. **12s. 6d.** net.

MODERN PRACTICAL CARPENTRY

Containing a full description of the methods of Constructing and Erecting Roofs, Floors, Partitions, Scaffolding, Shoring, Centering, Stands and Stages, Coffer Dams, Foundations, Bridges, Gates, Tunnels, Excavations, Wood and Half-Timber Houses, and various Structural Details; together with new and simple methods of Finding the Bevels in Roofs, Setting Out Domes, Steeples, &c.; the Uses of the Steel Square; Notes on the Woods used; and a Glossary of Terms.

By GEORGE ELLIS, Author of "Modern Practical Joinery," &c.

The aim of this work is to provide a comprehensive treatise on the whole craft of Constructive Carpentry in which every branch of the subject is dealt with in a thorough and practical manner. The Author's intimate knowledge of the practical details of the subject is patent on every page of the work, which forms the best practical exposition of the craft ever published.

JUST READY.—Second Edition, Re-written and Enlarged. Large Crown 8vo. Cloth Gilt. Price **4s. 6d.** net.

DANGEROUS STRUCTURES:
A HANDBOOK FOR PRACTICAL MEN
By GEORGE H. BLAGROVE, Certified Surveyor under the London Building Act, 1894.

The aim of the Author of this volume is to deal with some of those awkward problems in building which demand prompt solution. It describes ready means for getting over difficulties which frequently occur in practice, and supplies data from which efficient, and at the same time economical, remedies may be designed to counteract evils arising from structural defects.

CONCRETE AND STEEL SUPPLEMENT (MONTHLY).

CONCRETE AGGREGATES.

By Thomas Potter.

Concrete, in an ordinary way, is a mixture of two materials, usually known as the aggregate and the matrix—two words not very suggestive as to meaning, but accepted possibly for want of better.

The aggregate may be any reasonably hard material which can be obtained of a proper consistency, which is of a suitable size or easily convertible to a suitable size, is more or less porous, and for which the matrix has an affinity, the matrix being usually lime, Portland cement, or compounds of which the basis is either carbonate of lime or sulphate of lime. Aggregates should possess cohesiveness in conjunction with the matrices as a binding material, whichever they may be, and a capacity for resisting compressive stress.

More or less fitting aggregates for concrete are obtainable in nearly all localities, and as a result those which can be procured near to where wanted for use are usually selected; but

discrimination is necessary

in this direction, for there is much difference in the character of materials that pass by the same name. A specification may describe, for instance, that the aggregate is to be clean pit or river gravel, to be obtained locally, and this description may lead to difficulties, for it may be clean in a sense, but mixed with clay excellent in its way for garden paths and the like, but totally unsuited for making concrete. Nor does it follow that an aggregate that is well adapted for one purpose is equally so for others. For instance, Thames ballast is an excellent aggregate for concrete in foundations, but one of the worst for suspended floors, by reason of its weight and inability to withstand the effects of fire. This applies also to pit gravel, crushed flints from a chalk subsoil, and most quarry stones.

But whatever the nature

of the aggregate, it should, if obtainable, possess the following qualifications:—It should be angular in form, that its particles may interlock with each other and form a homogeneous mass, and this is not possible unless it consists of many intermediate sizes, from that of coarse sand to the largest permissible (the latter depends upon the purpose the concrete is for), as in its soft state it will adjust itself to form a homogeneous mass much more readily in a wide foundation, or thick wall, than it will in a narrow foundation or thin wall, enabling a proportion of the aggregate to be considerably larger in the former case than in the latter.

The best shape

for an aggregate may be better described, perhaps, as cubes of varying sizes, with all their angles and corners knocked off. The worst possible form of an aggregate is where it is comparatively large and uniform in size, or flaky, such, for instance, as stone chippings, or old bricks broken with hand hammers—a usual custom in many places. Concrete made with an aggregate of this kind is similar to a honey-comb, and the greater portion of the matrix is rendered useless.

To avoid this, we sometimes read that the aggregate is to be composed of, say, five parts of broken bricks, three parts of sand and one of cement, the sand being necessary to fill up the interstices in the bulk of the aggregate, which it probably does; but Mr. Grant's experiments for the Metropolitan Board of Works conclusively proved that when one part of cement is mixed with three parts of Thames sand it forms a mortar 33 per cent. only of the strength of neat cement. This conclusively proves that, although a proportion of coarse sand is necessary to obtain perfect homogeneity, no more than is actually necessary for the purpose should be employed. This condition, however, applies only where Portland cement is the matrix; when hydraulic-ground lime is used the reverse is the case. Major-General Pasley and others found from actual experiments that it reaches its maximum strength when mixed with two to three parts of sand.

If the aggregate is uniformly small

the result, where cement is the matrix, is a weak mortar instead of concrete. If a large number of small elements of any materials have to be cemented together to form a block of given dimensions, it is self-evident that the cement must have a much larger superficial area to cover than if they were larger in size. It may be that where the aggregate can only be obtained of small size, hydraulic-ground lime may be used with advantage, both as regards cost and strength, in places like foundations for walls or paving. The aggregate should be clean. This is of great importance, and easily determined if a suspicious aggregate is washed in a bucket of water and well stirred. If some test blocks of cement are made with this water and others with quite clean water, both from the same sample of cement, and tested in a cement testing machine under equal conditions, no further evidence of the necessity will be required. A good illustration of the value of a clean aggregate possessing a diversity of size can be seen any day in the streets of London where the roadways are being broken up for gas or water pipe repairs. The concrete below the paving is Thames ballast, and, although no great exactitude or care is usually apparent in the mixing and otherwise, three or four men with sledge hammers and steel wedges remove with difficulty, and after a deal of pounding, fragments of the concrete, which has the tenacity of solid rock. Thames ballast is not quite an ideal aggregate; its particles are rounded by attrition and not so angular as desirable, but it is clean and its proportions well distributed.

There is another factor

in the result, however, and this is that quickly after the concrete is deposited in place wood blocks or asphalt is laid thereon, which effectually excludes the air necessary for hardening; and as the retardation of setting increases the ultimate strength, and the only air that can reach it is from the soil beneath—*i.e.*, ground air—it is possibly years before the latter occurs.

In many aggregates, more especially those that have passed through fire—as boiler ashes, crushed brick rubbish, pottery, &c.—there is usually a film of fine dust which clings to the particles and can only be eliminated by washing. This is very seldom done, but, where circumstances permit, the percentage of gain in strength arising therefrom is of greater value than the extra cost of labour. An illustration of this may be found in smiths' ashes, which contain a large amount of a dusty element and particles of unburnt coal. Mr. Grant made a number of experiments to ascertain the comparative value of various sands when used to make cement mortar, with the result that smiths' ashes mortar was only 25 per cent. of the strength of mortar made with sand from burnt clay ballast, 50 per cent. from a clean pit sand and sea sand, and 33 per cent. from Portland stone ground to sand. A further result of these experiments was that coarse sand invariably gave better results than fine.

The materials in common use

more or less suitable as aggregates are Thames and other river gravels, pit gravels, stone chippings, flints, débris from brickyards and potteries, materials from walls of old buildings, blast furnace slag—the residue in smelting iron ore, breeze from gas works, boiler and furnace ashes, burnt clay, and local products of a similar character. If the smaller element predominates, a portion should be screened therefrom to bring it within the description previously given; on the other hand, if some portions are considered too large, they should also be screened out, broken, or otherwise removed. If generally the material is altogether too big, it should be crushed by a Blake, Marsden or other suitable machine. This is usual with slag, débris from old buildings, brickfields and potteries, and occasionally with quarry refuse. Materials crushed in this way have a suitable consistency for an aggregate without any addition thereto or subtraction therefrom, but I have, in cases where sand was wanted and none available, had the crusher set fine, to produce a larger proportion of the sandy element than was advisable, to enable a portion to be abstracted for mortar making.

Size of Aggregate.

As to what should be the extreme size of the aggregate, no definite rule can be laid down. It is one of the numerous things which occur in connection with the use of concrete that cannot be standardised. For a concrete wall or partition, say, 6ins. thick, obviously no portion of the aggregate should be larger—under ordinary circumstances—than would pass an inch and a quarter cross mesh sieve; on the other hand, for foundations 4ft. to 5ft. wide, the larger the better if homogeneity can be secured; and a knowledge of this is only arrived at by some experience. The surface appearance of concrete is not direct evidence of want of homogeneity; it may appear rough, and suggestive of unsoundness below the surface; but if a deep cut is made across the trench, lintel or wall after it is hard enough to permit this to be done without fracture, it will possibly be found of quite a different character to that which its surface appearance seemed to indicate.

It is generally assumed that a moderately porous aggregate will best ensure the adhesion of its particles, and, if capable of resisting a heavy compressive stress, it should be the best. This is only to a certain extent correct, for it has been proved that often the very opposite is the case. Major-General Pasley made some experiments in this direction by cementing together blocks of various materials and ascertaining the tensile strain which would separate them. The blocks, measuring 10ins. by 4ins. by 4ins., were cemented together with Roman cement, and tested at the end of eleven days, with the following result:—

Experiment No. 1.

	Pounds.
Bricks	1,359
Kentish rag stone	1,349
Bath stone	1,100
Cornish granite, polished	928
Do. do. not polished ...	900
Portland stone	856
Cragleith stone	855
Yorkshire stone	823

The result differs a good deal from experiments made by Mr. Grant for the purpose of ascertaining the best aggregates for concrete for the Thames Embankment and their various compressive strengths. Cohesive strength and compressive strength do not always go together, as the following experiments for ascertaining the crushing stress when compared with No. 1 will prove. The size of the blocks were 6-in. cubes; they were moulded on November 6th, 1867, and tested November 6th, 1868; the proportion was one part of Portland cement to eight parts of the respective aggregates of a suitable consistency, and both by measure, the blocks being compressed.

Experiment No. 2.

	Kept in air.	Kept in water.
	Tons.	Tons.
Portland stone	33	29
Pottery	22	23
Slag	19½	13½
Granite	19½	16
Glass	18	17½
Flints	17½	20
Ballast	13½	13½

Where the materials were not compressed the result was as follows:—

Experiment No. 3.

	Kept in air.	Kept in water.
	Tons.	Tons.
Portland stone	24½	19½
Pottery	18	18
Granite	14½	13½
Flints	14	12½
Glass	13½	11½
Slag	14	9½
Ballast	12½	11

These experiments show that where compression or a gentle impingement of the concrete can be practised the strength is considerably increased; but this is not always possible.

Other experiments made by Mr. Grant showed that certain concrete materials increased in strength, when the proportion of cement was increased, much more rapidly than others. For instance, and in the following order, 25 per cent. more cement increased the strength of the concrete 50 per cent. and over when made from (1) granite, (2) ballast, (3) slag. Portland stone chippings, nearly always stood first in the order of merit when tested for compressive strength in the case of many hundred experiments made by Mr. Grant; but the result of Nos. 2 and 3 experiments is puzzling—that glass should be an aggregate be nearly as strong as granite, more so than all.

Glass as an Aggregate.

We are not told what form of glass was used, but it must have been difficult to obtain any which would form a homogeneous mass. There is little or no porosity or capability of absorption in glass to afford a key for the cement. On one occasion, being desirous of making some cement slabs which should be quite true and smooth, I used a number of plate-glass squares as moulds or frames for the purpose, and, although their surfaces were oiled to prevent adhesion, it was impossible to liberate the cement castings; both the latter and the glass moulds had to be broken up.

Major-General Pasley found a similar peculiarity with hard stone and marbles—namely, that when their surfaces were worked perfectly true and smooth and cemented together, they resisted a pulling strain with a view to separate them equal to similar stones and marbles with their surfaces roughened or jagged to give a key for the cement, as is generally practised in masonry.

Two Years to Acquire Maximum Strength.

Another series of experiments made by Mr. Grant was to ascertain the proportionate rate neat cement, and half cement and half sand increased in strength, with the result that each reached its maximum strength in two years, but not before; and we may reasonably assume, therefore, that concrete does not attain its full strength until the cement has also, and this may not happen in practice until a much longer period than with test blocks, as, for instance, when it is of unusual thickness and air permeates but slowly, or the aggregate may be of a non-porous character. I remember an occasion when a comparatively newly-built concrete wall, 4ft. thick, had to be removed; the outside portion was detached with some difficulty, but as the centre was approached it became softer, and at that point could be broken apart with the hand.

Coke Breeze.

Mr. Grant on no occasion appears to have experimented with boiler ashes, furnace clinker, or coke breeze. Their appearance is not in their favour as aggregates; coke breeze more especially is somewhat small and soft, and its particles not sufficiently diverse in size to expect good results therefrom. Until recent years, and when it began to take the place of Thames ballast for floors, it was considered a waste product which the gas companies were glad to give away, and when this did not happen, it was taken away in vessels and dumped down wherever dumping ground was available, or pitched into the sea. Messrs. Kirkaldy & Son's experiments have, however, quite changed the opinion of its value as an aggregate; they made experiments for the West Ham Corporation a year or two since with coke breeze as an aggregate, and for comparison with stock brickwork in mortar, with the following result:—

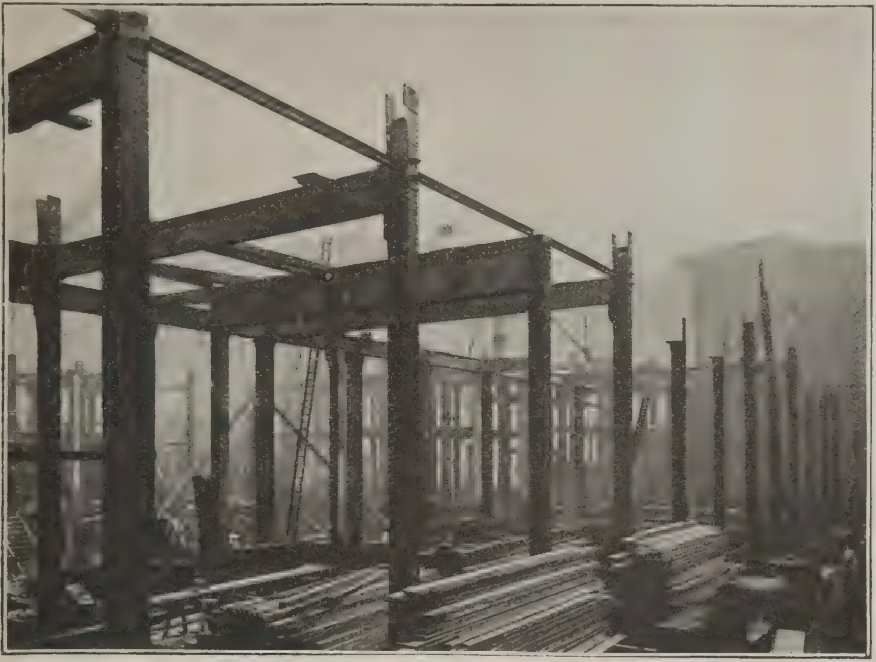
Experiment No. 4.

		Cracked slightly.		Crushed.	
		lbs. per sq. in.	Tons per sq. ft.	lbs. per sq. in.	Tons per sq. ft.
2895	Brick pier A 18″×18″×6 courses high, stock bricks set in blue lias lime mortar ...	730	46.9	730	46.9
2896	Brick pier B 18″×18″×6 courses high, Harold Wood bricks set in blue lias lime mortar	1099	70.7	1168	75.1
2897	Concrete block C 18″×18″×18″ 6 parts coke breeze, 1 part Portland cement, 2½ years old	2037	131.0	2037	131.0

This is an extraordinary result so far as coke breeze is concerned, and about equals the crushing strength of gault bricks.

(To be concluded.)

WALDORF HOTEL, ALDWYCH, LONDON: FOUNDATION WORK.



WALDORF HOTEL: STEELWORK AT REAR OF SITE.

THE WALDORF HOTEL.

After considerable delay the building of the Waldorf Hotel in Aldwych, London, has now been resumed. The view on the preceding page showing the foundation work was taken nearly a year ago. The job remained very much in that condition till quite recently, but work has now been recommenced in earnest and everything is being pushed on with astonishing rapidity. The views on this page show the present condition of the steelwork, which is designed as a skeleton framework on the American pattern familiar to our readers: in fact, it was designed by Mr. S. Bylander and is being erected by the Waring White Building Co., who were jointly responsible for the Ritz Hotel and the "Morning Post" building. Within the past two months the construction has made rapid strides, and the granite facing to the hotel on the Aldwych front is already well started, while bricklayers are busy at several parts of the site. Very much the same method of erection is being employed as at the Ritz Hotel. We shall publish further illustrations and particulars of the Waldorf Hotel in future supplements. The architects are Messrs. A. Marshall Mackenzie, A.R.S.A., & Son.

RAPID CONSTRUCTION IN REINFORCED CONCRETE.

On the next page we give three photographs showing the different stages of a new building which has been erected at Carlisle for Messrs. Hudson, Scott & Sons, Ltd., as a new wooden case-making shop. The Kahn system of reinforced concrete was used throughout, and this building furnishes a striking example of what can be done in the way of rapid construction under this method. Fig. 1 shows the condition of the building after two weeks' progress, Fig. 2 after four weeks, and Fig. 3 after six weeks. In the last-mentioned photograph the constructional part of the work is practically completed. A novel method of handling the concrete was used, which is shown in the foreground of the pictures. Another feature of the building was the small number of columns used. The bays supported by the columns were 20ft. square. The main carrying beams of 20ft. span were 12ins. by 19ins. below the floor slab, and the secondary beams of 19ft. span were 10ins. by 11ins. below the floor slab. The reinforcement for the main beams consisted of two $1\frac{1}{4}$-in. Kahn trussed steel bars, and the reinforcement for the secondary beams of two 1-in. Kahn trussed bars. The floor slab was 5ins. thick on each storey, and the roof slab was 4ins. thick. The columns supporting the roof were 10ins. square and increased to 16ins. square on the ground floor. The walls as well as the stairways throughout were constructed of reinforced concrete. The result is a thoroughly fireproof building with a minimum rate of insurance for the owners. The contractors were Messrs. Stephen Easten & Co., Ltd., and the engineer who designed the work was Mr. H. W. Taylor, A.M.I.C.E., to whose enterprise the speed of erection was due.

REINFORCED CONCRETE FACTORY FOR HUDSON, SCOTT & SONS, LTD., CARLISLE.

A REINFORCED CONCRETE FLOOR TEST.

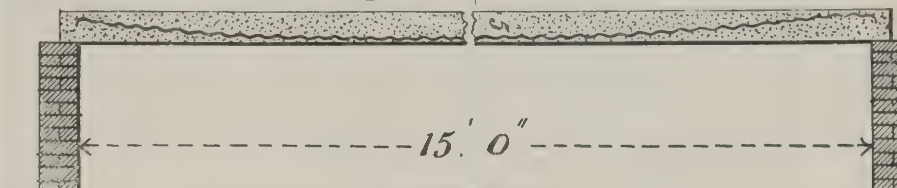
We give particulars below of an interesting test which was made recently by Messrs. Potter & Co., Ltd., of 66, Victoria Street, on a floor 22½ft. by 15ft., and only 5ins. thick, without any intermediate supports or steel or reinforced concrete beams under :—

Total area clear of all supports—337 ft. super.
Thickness of floor—5 inches.
Steel reinforcement—1⅓lbs. per ft. super.
Total weight of steel reinforcement—448lbs.
Constructed on April 18th.
Loaded on July 18th with 59lbs. per ft. super.
 Result—Deflection ¼in.
Load increased on July 19th to 118lbs. per ft.
 super. Result—Total deflection ⅓in.
Deflection on July 21st—¾in.
Loaded on Agust 9th to 254lbs. per ft. super.
 Result—Total deflection 1¼in.

The foundations and supports having sunk at one corner 4½ins., the load was not increased. A fine crack was apparent on the underside, starting at one corner diagonally, of 8⅓ft. in length; since that date other fine cracks have appeared.

On October 6th the floor load had been maintained with no further results.

It would be interesting to learn if any other test floor has been made of similar dimensions and thickness, with such little reinforcement. Messrs. Potter & Co. do not necessarily recommend such large unsupported floors in general practice.



CROSS SECTION.

ANNEXE, "DUNDEE COURIER" BUILDING, DUNDEE. WORKING DRAWING No. 7, SHOWING FRAMING PLAN AND SECTIONS OF ROOF CONSTRUCTED IN REINFORCED CONCRETE, BY STUART'S GRANOLITHIC STONE CO., LTD. E. P. WELLS, ENGINEER. NIVEN & WIGGLESWORTH, ARCHITECTS.

A REINFORCED CONCRETE NEWSPAPER OFFICE.

In the "Concrete and Steel" supplement to our issue for October 10th we published an article on the reinforced concrete construction of the annexe to the "Dundee Courier" building, recently erected in Dundee, together with some working drawings supplementary to others published in supplements to former issues dated May 25th and June 20th. We now give three further working drawings, completing our illustration of this important example of this form of construction.

The complete set of working drawings which we have published in our columns is as follows:—

No. 1. Framing plan of basement.
No. 2. Framing plan of ground floor.
No. 3. Details of ground floor beams.
Nos. 4 and 4A. Details of the press-pit, beams, stooling-beams, floors, &c.
Zo. 5 Framing plan of first floor.
No. 6. Details of first floor beams, &c.
No. 7. Framing plan and sections of roof.
No. 8. Stairs, landings and 2½in. hanging walls, &c.
No. 9. Details of strong room on first floor for the Scottish American Trust.

Working drawing No. 8 is a specially interesting piece of construction. It will

be seen that the stairs are supported at one end upon the outside wall, but that the other end and the enclosing wall are hung up from the floor above.

Working drawing No. 7 shows the way in which Mansard roofs are constructed on Mr. Wells's patent system.

Working drawing No. 9 is another adaptation of reinforced concrete to which special attention deserves to be drawn. We referred in a small note on Page 36 in our "Fire" supplement for October 24th to the fact that the excellent fire-resisting qualities of reinforced concrete had brought about a comparatively new application of this material in the construction of fire-resisting and burglar-proof strong-rooms. This is a case in point. The detail referred to as "wall D" shows the manner in which connection was secured to the solid rolled steel columns which were used in the building in order to economise space.

We would refer readers for further particulars of the general construction to our other issues referred to above.

"MORNING POST" BUILDING.

We give herewith two further illustrations of the construction of this building, of which a number of photographic views and some working drawings of the steel work have been published in former issues of this supplement. The first of the present views shows the method of supporting the centering for the double floor construction on the Columbian system of reinforced concrete, while the second view shows the boards to retain the concrete and the peculiar +-shaped Columbian bars which support the ceiling in position. So far as we recollect, this double floor construction has never been illustrated in this way before. The usual Columbian floor is a solid one and has bars shaped thus ‡ Such bars, indeed, are used for the upper construction of these particular floors of the "Morning Post" building. After the ceilings have been built, clinker ashes, similar to those forming the concrete aggregate, are placed upon the ceilings in a layer several inches thick, so as to form a centering for the upper construction. Holes are left in the latter, so that when the concrete has set the ashes can be dug out, leaving the floor hollow.

The site of this building has nearly the shape of a narrow triangle, with the longest side (to Aldwych) slightly curved. Further, all the corners are rounded. The first appearance of the steelwork, seen from the corner of Lancaster Place and the Strand, reminds one of the "flatiron building" in New York, but the building has only five floors above the ground floor with one mezzanine and roof, and is not to be a skyscraper.

The framework at the Strand corner is of greatest interest. The exterior walls and the floors are carried on curved plate-girders cantilevered out from the columns—a construction difficult to design and to erect, but one affording great stability and leaving the ceilings in the most important rooms at the corner uninterrupted by girders projecting below. At the fourth-floor level there is an extra heavy curved girder, resting on top of the stanchions and carrying the dome; this girder was illustrated in our issue for October 10th. The dome is framed up of I beams bent in the vertical plane and tied together at intervals.

Altogether about 950 tons of steelwork was needed for the building, half of this being below ground-floor level. The depth of foundations is about 39ft. below street-level. A concrete retaining wall is constructed all around the building, having a thickness at base of about 10ft. The basements are constructed like a tank, with an asphalt course all round to keep out water.

In one part of the building there are three floors below the ground level, and in the centre there is a large room 22ft. high, intended for the three great newspaper presses. Three of the inside stanchions are omitted below ground floor, and heavy plate-girders are placed to carry them.

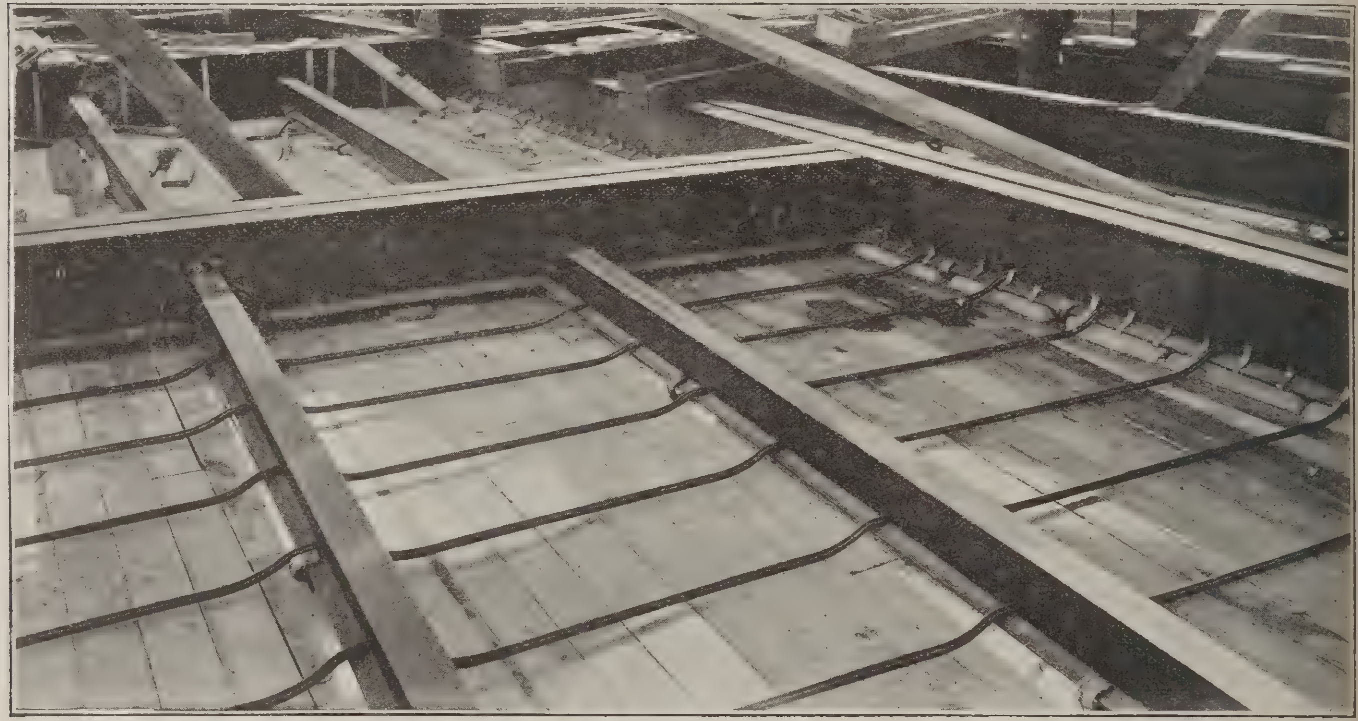
The exterior walls are of Norwegian granite with brick backing the whole height. The total thicknesses of the walls are in accordance with London Building Act, although they do not carry any loads.

The foundation work is somewhat interesting. Owing to the heavy loads upon the stanchions the foundations have considerable spread, and the concrete foundation beds for the printing presses, situated in the basement, overlap them. If these were made continuous the vibration from these presses would have been transmitted through the steel skeleton to a most distressing extent. The foundations for the printing presses have, therefore, been built down to earth in the spaces between the spreading stanchion foundations and the portions overlapping cantilevered from the separate foundations, with a 6in. layer of sand interposed between, so as to deaden vibration.

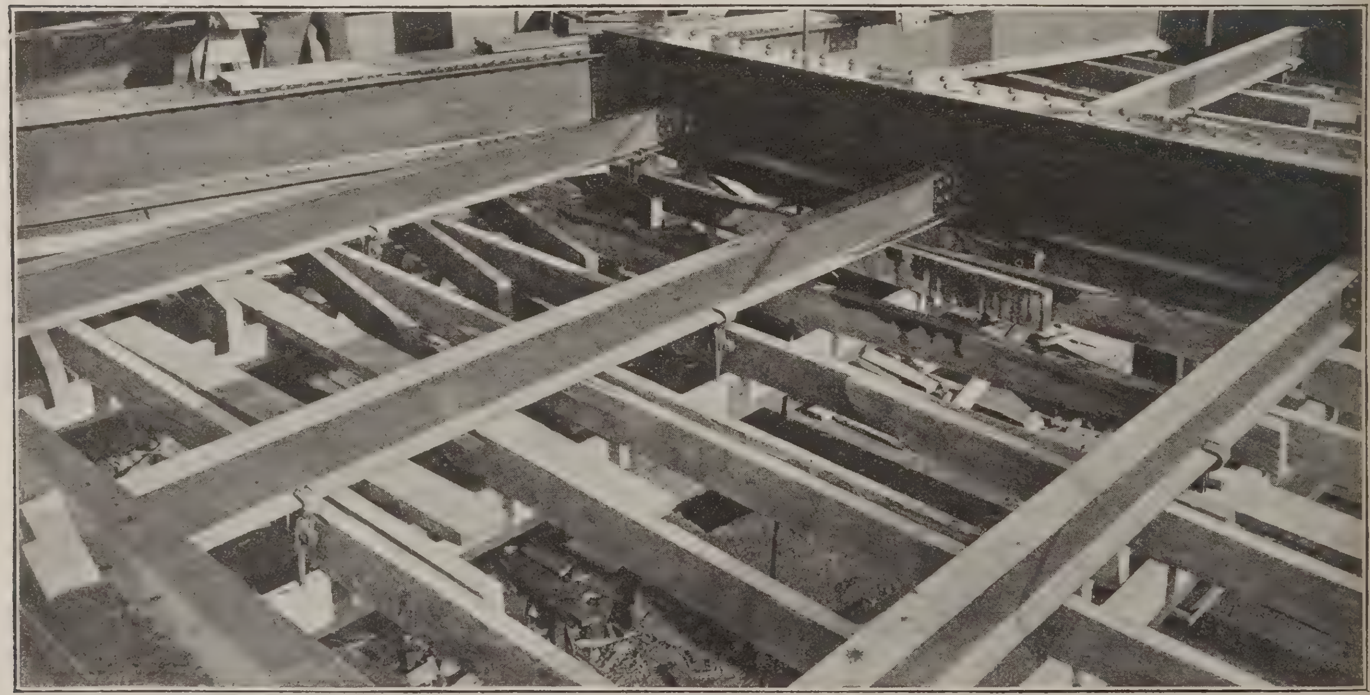
An artesian well has been drilled on the site, which will supply the whole requirement in the building. On the roof four water-tanks, together containing 24,000 gallons, are provided. Heavy steelwork at the roof-level was therefore necessary.

The erection of the steelwork has been very rapid, but, nevertheless, very careful. The last cast-iron base in the foundation was set on June 30th, and the fifth floor was erected on September 14th, the roof-framing being completed (including dome) on September 21st. As there are ten floors (including roof and two mezzanines) about one floor was erected per week.

The steelwork has been painted one coat after erection, and is to be enclosed with 2ins. of concrete throughout, for protection against fire.



View showing centering completed, and ceiling reinforcing rods in position.



View showing centering partly erected.

CONSTRUCTION OF COLUMBIAN DOUBLE CONCRETE FLOORS AT THE "MORNING POST" BUILDING, ALDWYCH, LONDON.

The steel (which is German) was all fabricated in advance, and we would draw attention to the fact that shop drawings and the work generally were carried out with such accuracy that, in spite of the curved front and the rounded corners of the building, the steel fitted perfectly when it was put in place. It may be considered a record of correctness and good work.

The architects of this new building are Messrs. Mewès and Davis, of 6, Dean Street, W., the contractors being The Waring White Building Co., of 1a, Cockspur Street, S.W. The steelwork has been designed and erected by the contractors, Mr. S. Bylander and Mr. Nicholson (both of the Waring White Building Co.) being responsible for the design and erection respectively.

REINFORCED CONCRETE SYSTEMS.

VII.—Johnson's Wire Lattice.

Johnson's wire lattice system of reinforced concrete construction has only recently come into being, but it belongs to a type of construction which has been used in America for many years; in fact, it was first introduced in its present form in response to suggestions of American engineers engaged in the construction of the Savoy Hotel extension, about two and a half years ago. These engineers had been accustomed to using continuous wire lattice in the United States, and, desiring to adopt the same system of construction in this country, they looked round for a manufacturer able to make a quantity. They found that Messrs. Richard Johnson, Clapham & Morris, of Manchester, not only possessed the means of undertaking its manufacture, but were already experienced in such work, for they had made a quantity of wire lattice for reinforcing a concrete cover to conveyor subway alongside No. 9 Dock, Manchester Ship Canal. The Savoy Hotel extension was, however, the first large job where their wire lattice was used. About 30,000 sq. yds. of floors were laid there.

Longitudinal Reinforcement Insufficient.

Some system of crossing wires is necessary in order to adequately reinforce concrete floor construction. If only longitudinal reinforcement is used, cracks will occur, due to one portion of the floor being loaded heavier than another portion. It is for this reason that Coignet, Monier, Hennebique, and other pioneers in reinforced concrete construction early adopted a lattice reinforcement. Generally the sizes of the rods in floor reinforcement are determined by calculating the floor as a beam running longitudinally, the crossing rods being small and simply used to obviate the tendency to develop longitudinal cracks, due to irregular loading. The points where rods cross each other are wired, so as to keep them in place. The Johnson lattice is somewhat similar in form, because the longitudinal wires are generally of larger section than the crossing wires, but the latter are made of stouter proportions, it being recognised that ordinary floor slabs in buildings are approximately square and receive support from all four sides.

The advantages of Johnson's wire lattice are that it is conveniently handled, does not bear rough edges to tear the hands, that the lattice wires are kept correctly in place and that the lattice is made in continuous lengths, thus giving a continuous bond and creating a monolithic construction.

How the Lattice is made.

The lattice is made of drawn steel wire from 13 to 6 gauge, and can be laid in lengths up to 300ft., so that in a building of ordinary size the reinforcement can be secured at the front or rear and carried through the entire length without a break. Heavier gauged wire can, if desired, be used, but the lengths of lattice are then about 50ft. long and sheets are connected to each other by hooks if the length of the building requires more than one sheet. The lattice is usually made, however, in rolls 6ft. wide by 120ft. long. Rolls can be made of any convenient width other than 6ft. Usually the lattice has a square mesh, but it may have an oblong mesh if desired. It can be made with a greater strength in either the long way or the short way of the sheet or roll, and may also be given extra strength in certain parts, as will be described later.

High Elastic Limit Steel.

The fact that this lattice is made from drawn steel wire, of course, means that the metal has a high elastic limit and, consequently, gives a greater factor of safety than common low elastic limit steel. The factor of safety in construction depends, of course, upon the elastic limit, because when the stress goes beyond this point the strain increases disproportionately to the stress, and the modulus of elasticity drops to about 5,000,000. Consequently, when the elastic limit is reached the strain will be permanent and the material will eventually fail without ever reaching its ultimate strength. The common factor of safety of 4, which is taken upon the ultimate strength, means, with ordinary commercial soft steel, really only a factor of safety of 2. Although with high elastic limit steel the ultimate strength may not be increased, yet it gives a much higher factor of safety, because the elastic limit is higher. This is given to the reinforcement in the Johnson wire lattice system in the best way, not by the dangerous practice of adding carbon to the steel, which renders it shorter in grain and liable to fracture, but by manipulating ordinary steel in the process of manufacture—*i.e.*, by drawing the wire through a die. The wire used has an average elastic limit of 65,000 lbs. per sq. in. The ultimate strength is quite 85,000lbs.

The reinforcement in Johnson's wire lattice is of small section. Consequently there is no danger of want of adhesion between the concrete and the reinforcement such as occurs with large sections, and the wire does not pull through when tested to destruction.

Tests.

Various tests have been carried out upon slabs reinforced with the lattice. We may mention one carried out at Johnson's works at the time of the Savoy Hotel extension. A slab 4ins. thick and of 6ft. clear span, made of cement, brick dust and broken brick in proportion of 4 parts aggregate and 1 of cement, was loaded to 585lbs. per ft. super., at which point the deflection was found to be 4½ins., although the deflection had only been 5-16in. at 393⅓lbs. The load was increased, but unfortunately fell over before the breaking-point of the slab was reached. The reinforcement was 1½-in. mesh by 11G. lattice.

Standard Sizes.

The following is a table of sizes and weights of Johnson's wire lattice of standard manufacture, but any required variation can be made in a quantity :—

No.	Mesh (ins.)	Wires.	Approximate wt. per sq. yd. (lbs)
1	1½ square	No. 13×13's gauge	3.4
2	1½ do.	No. 11×11's do.	5.0
3	1½ do.	No. 10×10's do.	6.6
4	2 do.	No. 6×11's do.	8.5
5	1½ do.	No. 6×11's do.	11.25
6	2 do.	No. 3×11's do.	13.5
7	1½ × 3	No. 13×13's do.	2.6
8	1½ × 3	No. 11×11's do.	4.0
9	1½ × 3	No. 10×10's do.	4.9
10	2 × 4	No. 6×11's do.	6.4
11	1½ × 3	No. 6×11's do.	8.6
12	2 × 4	No. 3×11's do.	10.1
13	1½×2½(twin wires)	No. 10×11's do.	9.8
14	1 × 2½ do.	No. 10×11's do.	12.7
15	⅝ × 2½ do.	No. 10×11's do.	18.9

Calculations.

As regards calculations for members for reinforced concrete construction, Messrs. Richard Johnson, Clapham & Morris have no special theory of their own. They have adopted a modification of the general modern theory for the design of reinforced concrete associated with the names of Considère, Ritter, Christophe, Hatt, Talbot, and Turneaure. The differences between these various authorities very little affects the practical designing of reinforced concrete works.

We will now describe various forms for reinforced concrete construction, which have been worked out to use Johnson's wire lattice to the best advantage.

Floor Systems.

Fig. 1 shows the way in which the reinforcement is placed in floors of small span. This construction is economical up to 6ft. span. The steel lattice, it will be seen, is protected from corrosion and fire by the concrete, as it should be. Occasionally the thickness of the floor has been reduced to the exact depth of the joist. The lattice over the joists and in the centre of the slabs is then exposed and liable to corrosion, but, of course, some form of cement flooring and plastering might be used to protect the metal.

Fig. 2 shows the construction adopted for floor spans of 8ft. to 16ft. The steel joists are here shown exposed on the soffit, but they can be protected in the usual manner and a suspended ceiling can be adopted if a panelled ceiling is not desired.

A further system of flooring is shown in Fig. 3, where steel joists are used as the main beams. This suits large spans, from 12ft. to 25ft., and reduces the quantity of concrete needed with a flat floor of such a span.

Corridors and Wall-End Bays.

Figs. 4 and 5 show methods for the support of concrete floors along corridors or wall-end bays. Fig. 4 is a method adopted in the construction of new buildings; the portion of floor shown resting upon the wall may be built in, or it may be supported by corbelling out. When, however, the walls are already built and it is not advisable to cut them away, the method shown in Fig. 5 has been found serviceable. A channel is placed as shown against the wall, bolted through to a plate on the other side. The lattice is not fastened to this channel, which only serves to support the concrete.

It is unnecessary for us to show the manner in which roofs are reinforced with Johnson's lattice, as the construction is very similar to that adopted for floors.

Pillars.

The wire lattice system has recently been adapted to other forms of construction besides floors. Considère's experiments have shown that the ideal reinforcement for columns or pillars consists of spirally-wound rods, but the difficulty of keeping the spirals in place has prevented this being generally adopted in practice. (Fig. 6.) Messrs. Richard Johnson, Clapham & Morris have, however, arrived at a method of overcoming the difficulty by weaving rods vertically up the spirals, so as to keep these latter firmly in place while the concrete is being tamped inside the column. These reinforcements can, of course, be made for square pillars with equal facility.

Beams.

As regards the reinforcement for beams, it is now common knowledge that, with distributed loads, beams are liable to fail by shear; so that they require a vertical reinforcement such as stirrups, wires or hangers. The method by which the reinforcement against shear is given in Johnson's lattice system is shown in Fig. 7. Heavier rods are arranged to be placed at the bottom of a beam and passed through the lattice, as shown, before being placed in the mould. Rods are used, as wires of sufficient strength would be too stiff to be woven into the lattice.

Sewers, pipes, water conduits, &c., can also be reinforced with Johnson's ordinary lattice and need no explanation.

A work in course of Construction.

Among the more important works at present in course of construction where this lattice is used we may mention Ryde Pier Deck. This work comprises the removal of an existing sleeper road, ballasted track and timber decking, and the construction of a new deck in reinforced concrete upon the existing steel superstructure. The latter consists of compound longitudinal girders and rolled steel joist fillers, these being spaced at about 5ft. centres. The deck is designed to carry a safe load of 15 tons per lineal yard of track. The reinforcement consists of sheets of Johnson's No. 11, 1½in. by 3ins. mesh No. 6 by 11G. lattice in lengths of 101ft., the reinforcement thus being continuous over 20 supports. The ratio of reinforcement to concrete in sectional area is as 1 : 288, which is roughly .33 per cent.

The following are some of the jobs in which the lattice has recently been employed :—

Savoy Hotel Extension.

Manchester Ship Canal Co. : conveyor tunnels, floors, girders and walls.

Manchester Corporation Water Works : bridge work and arched flooring.

H.M. Office of Works : bridge decking Regent's Park.

Mr. W. T. Couldrey, London : warehouse floors.

Joseph Baker & Sons, Ltd. : foundations.

L. & S. W. & L. B. & S. C. Rys. Joint Comm. : railway pierdeck work, Ryde, I.W.

Wolseley Tool & Motor Car Co., Ltd. ; garage divisions.

Mackey-Seymour Engineering & Coke Oven Co., Ltd. : floors.

In our issue for November 28th we shall publish a special article on

NEW BUILDINGS IN GLASGOW,

which will be illustrated by a large number of photographs and drawings.

An Engineer's Address. CALLING to mind the sufferings of the past, we are apt to count presidential addresses as necessarily dreary affairs. Within the past week, however, we have had two great exceptions in the inaugural addresses delivered by Mr. Collcutt before the Royal Institute of British Architects, and by Sir Alexander Kennedy before the Institution of Civil Engineers. Mr. Collcutt's address was given in our issue for last week, and readers who took the trouble to peruse it will have noticed that the new president of the Institute quite departed from the time-honoured, wearisome recital of the events of the past year, with desultory comments thereon, giving instead some spirited criticism on a few outstanding matters that have attracted attention recently. Sir Alexander Kennedy's address was also critical, wide in its treatment, and altogether one of the best addresses of its kind we have heard for a long time. At the architectural societies we are accustomed to diatribes against the engineer who essays a feeble sort of architecture, and we are also accustomed to the assumption, by consequence, that things might be beautiful if only architects had a hand in the matter. It is refreshing, therefore, to hear a brilliant engineer making some pertinent retorts about architects. Sir Alexander, however, recognised that architects had some right on their side, and he hoped that in future engineers might not be so great sinners as they had been in the past. "We expect architects," he said, "to consult and employ engineers to help them over structural difficulties, and we may even scoff when they come to grief for not doing so. They are, on the other hand, quite entitled to turn the tables on us when they see that an engineer has put up a hideous barn which they could have transformed into a pleasing structure by their own special knowledge, and by that sense of form which it has been their chief business to cultivate, while we have been working at bending moments and breaking loads." This is a matter likely to come into greater prominence in the future, in view of the vast changes brought about by steel-frame buildings, demanding the engineering problems to be solved first, and the architectural clothing added later. Sir Alexander Kennedy raised the question, To what extent do engineer and artist come in contact? When engineering structures were confined to masonry bridges and pumping-stations the matter was comparatively simple, it being difficult to make a stone bridge which was structurally efficient and actually hideous at the same time, but it might very well be doubted whether the castellated or quasi-Gothic building was the most suitable form for a Cornish engine-house. Nowadays engineers have little chance of building stone bridges, but Sir Alexander challenged comparison between the great masonry dams of such undertakings as the Birmingham waterworks and any architectural structures. The president of the Institution of Civil Engineers did not feel himself competent to discuss the true inwardness of our consciousness that a Parthenon in cast iron, or Gothic tracery in steel bars and angles, however closely each might imitate its original, would not be beautiful; but whatever the reason might be, he said, the consciousness was probably there with all of us. "Possibly if cast iron had been known in Athens 3,000 years ago our ideas would have been different. But as it was not, we must take things as they are, and recognise that our feelings of to-day, reasonable or unreasonable, are what really constitute the facts of the case." Bearing that in mind, however, it was a little amusing to hear Sir Alexander's references to what was done in the way of architectural trimmings to purely mechanical contrivances. Even in the time of his own apprenticeship it was universal for bed-plates, entablatures and other large castings to be finished at their corners and angles with mouldings, more or less carefully designed according to classical models, while moving parts, such as the bosses of cranks, were ogeed round their edges, and no connecting rod of a stationary engine was considered finished without a double ogee ring round the middle of its length! Matters have improved nowadays, for, long since, we have come to the conclusion that a mere copying of a classical outline in a wrong material is not artistic and is not beautiful.

The Army and the Building Trade. THERE is no end to the reforms suggested in connection with the Army, and we should hesitate to propose another, were it not that we feel that our proposal were a novel and a far-reaching one. It implies a fundamental change of outlook. It has been often stated that two of the chief reasons why the Army is unattractive are that the pay and the prospect of a soldier securing profitable employment in civil life after he has left the service are both alike small. We can hardly afford more pay, for the soldiers' services in time of peace are unremunerative to the nation. In regard to the second point, a discharged soldier is an unskilled worker. We propose to meet both these points. We would have the soldier taught a trade, and call upon him to use it during the term of his service. The nation in return for this remunerative work would be able to grant extra pay. The building and engineering trades offer particularly favourable opportunities in this respect. Do we not know that many of the buildings, aqueducts, harbours and bridges of Rome were built by the Imperial soldiery when in winter quarters or on garrison duties? Does not the German army to-day often build its own barrack structures, sheds, &c.? Why should not the British Army build its own barrack structures, sheds, fortifications, and undertake the many other Government works given out to contract? They are now designed by its own staff, and could be executed by its own men.

GUTTERS.

So much of the effect of every building depends upon its treatment at the eaves, that it is to be wondered why this important detail is usually dealt with, in the average text-book, in such a slipshod and often unpractical way. Being the lowest point of the roof, provision must be made for the removal of rainwater, and being also the point of juncture between covering and enclosing surfaces, some strongly-marked emphasis seems æsthetically necessary.

The dripping eaves represent, no doubt, the earliest device in point of date, as well as the simplest and most direct solution even now for isolated buildings of no great height standing within their own ground. The necessary complement of the dripping-eaves is some special treatment at the ground level as a protection against the falling water and to avoid splash at the base of the walls. Perfect protection in this way is afforded by the narrow paving of "petrified kidney" pebbles and the tarred plinth which usually surrounds the Essex thatched cottage. To provide a reasonable gutter to a thatched roof is a practical impossibility, and for this material, at any rate, the dripping-eaves is the natural finish. The drip from thatch is also less persistent and concentrated than from any other form of covering, owing to its indefinite edge. A considerable amount of projection (in direct proportion to the height of the walls) must be always provided where water is allowed to drip from roofs; otherwise it may be blown against the building in its passage, and this is the reason why moderate height has been counted a necessity in this treatment, as the projection necessary in a high building would become excessive and wasteful. An interesting and suggestive partial use of the dripping eaves by Mr. Lutyens may be seen at the new offices of "Country Life," where a pantile roof of steep pitch, placed upon a solid attic storey, drips into a lead gutter formed in the stone cornice some feet below. New Scotland Yard has a similar device.

The storage of rainwater is not so conveniently arranged with dripping eaves as by the use of gutters and downpipes. One of the simplest forms of gutter (Fig. 1) is that constructed of wood to a **V**-section and supported by wooden gallows brackets. This is capable of being very effectively treated, as in a well-known example at Rye which has been often sketched and photographed. Wooden gutters, if well tarred inside, remain quite watertight, besides being cheaper and more durable than the cheapest zinc and iron gutters. It is interesting to note that in American provincial practice they form the rule rather than the exception. The supporting brackets may be appropriately ornamented by that fanciful type of chamfering seen on old farm-wagons.

Zinc gutters are cheap and tractable. For these reasons they are largely used by the speculating builder. They require staying internally at frequent intervals to prevent sagging owing to the flexible nature of the metal. Although they are light, there is, however, no need for them to be made so flimsy as they generally are: they are never free from the disadvantage that should a ladder be leaned against the gutter it is bent out of shape. Cast iron probably makes the most generally satisfactory cheap gutter, and the half-round is its most pleasing form. This may be supported in various ways—by wrought-iron brackets screwed to the rafter feet (Fig. 2); by wrought or malleable brackets screwed to a wood fascia (Fig. 3); or by wrought iron driving brackets direct into the walls (*see* THE BUILDERS' JOURNAL for May 16th last). Any one of these is good on occasion, but there are points to be considered whichever be adopted. In old work it is quite usual to see the gutter fixed so low that the line of the roof-surface produced would clear it entirely. This is of advantage in two ways—namely, in the event of a torrential downpour the gutters are likely to be insufficient to carry off the water, which accordingly would overflow and drip or splash against the walls; but when fixed low in the manner described, the water in such case shoots altogether clear of both gutter and walls. Similarly, snow is able to slide off the roof without striking the gutter. A disadvantage of this low position occurring when the gutter is fixed to the rafter feet is the liability for water to be blown by a gusty wind out from the back of the gutter against the walls. This is almost obviated if the gutter, instead of being true half-round, is of **J**-section, which also allows it to be screwed as additional fixing. The defect is also remedied by the use of a fascia board. Though, however, an open eaves with cut sprockets or rafter feet is capable of pleasing treatment, the addition of a fascia board at once ruins the effect, making it poor and mean, and if such a provision is deemed desirable a close eaves or box cornice (Fig. 4) should be formed, by the addition of a soffit and bed-mould either in wood or plaster. In this connection it may be said that although the attempt is often made to persuade a cast-iron ogee gutter to masquerade as the cymatium of such a cornice, it is rarely a success. It is far preferable either to frankly recognise the gutter (as before described) or to form a lead gutter behind a wooden cornice.

The third method of supporting a half-round type of gutter—by iron driving brackets—is a very good one and allows all the eaves to be covered. The driving brackets (Fig. 5) can be made by any

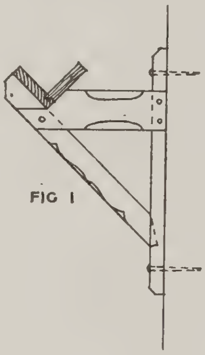

FIG 1

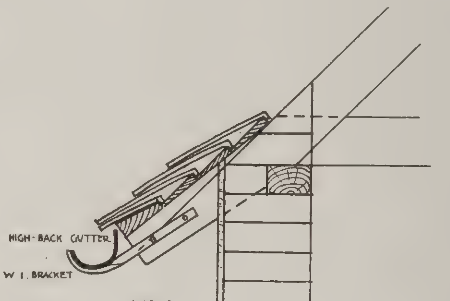

FIG 2

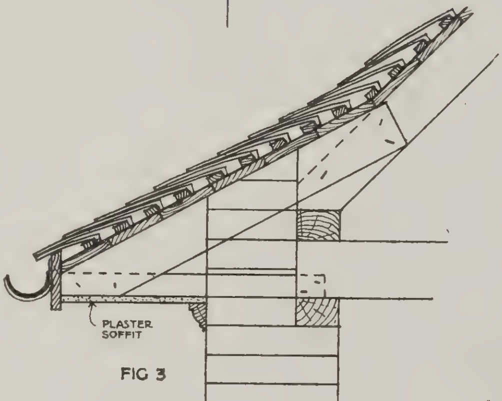

FIG 3

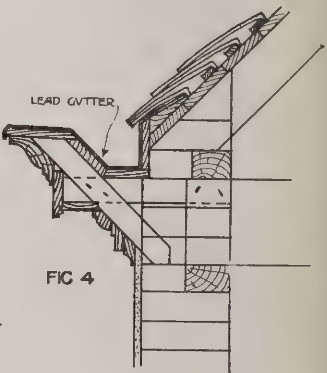

FIG 4

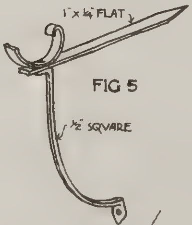

FIG 5

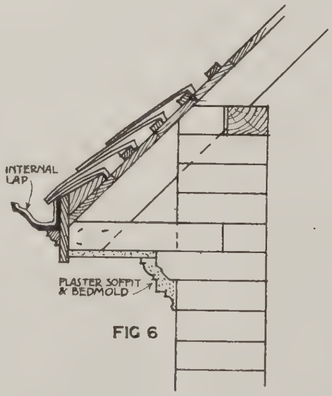

FIG 6

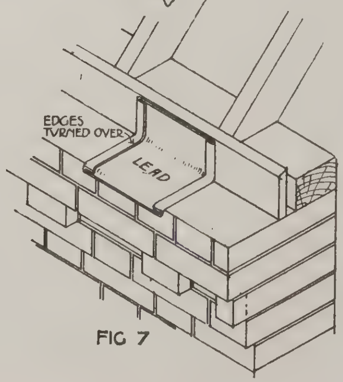

FIG 7

ordinary smith at very small cost, but a few points need to be remembered in their design. The fixings should be kept an exact dimension of the brick or masonry courses, and a small extra length should be provided at the back-end of the actual gutter-clip, which is bent over to prevent the gutter slipping out of place when a ladder is reared against it. Should an ogee or moulded gutter be fixed to a wood fascia (Fig. 6), it should not depend entirely upon screws, but in addition should bear upon a small moulding, as the heads of the screws are liable to rust off. The socket joints should have an internal lap.

It is sometimes thought necessary to abandon eaves projection and allow the gutter to rest upon the wall with or without corbel courses. This is a usual though not very desirable position, but a few simple precautions will diminish the risk of leakages soaking down unobserved into the brickwork. In the first place the back edge of a wall gutter should be ever so slightly higher than the front. In the event of overflowing, water then escapes visibly. The joints also need attention, as they are apt to leak owing to expansion and contraction after some little exposure to changes of temperature. This liability has been sometimes expensively recognised by architects in placing a lead covering on the wall seating below the whole length of the gutter, but a small saddle piece (Fig. 7) below each joint will do all that is needful.

Wall gutters are frequently made extravagantly large owing to the difficulty of securing rapid removal of water by an adequate fall towards the outlet. Should expense allow, a cast-lead gutter is a superior alternative and capable of charming treatment by pattern in relief, tinning, or gilding. Falls may be obtained within the depth of such a gutter and the risk of leakage is practically absent.

Where a roof is much broken by dormers or chimneys, necessitating numerous short lengths of gutter, all may discharge into a continuous trough carried on corbels at the nearest convenient point below. One downpipe and gulley may thus be substituted for a number. A similar result can be achieved where eaves project well, by carrying the half-round or **V**-gutter across any gaps, upon brackets.

King's Lynn Grammar School.—The King and Queen opened last week the new buildings of the King Edward VII. Grammar School at King's Lynn, which have been erected from designs by Mr. Basil Champneys, at a cost of nearly £40,000. The buildings form three blocks (connected by a corridor), the central one consisting of the main school hall, with classrooms attached, while to the north is the science and art wing, and to the south the boarding-house and master's residence.

University College Hospital, Gower Street, having now been completed, was formerly opened last week by the Duke of Connaught. The plan is that of a central block comprising staircase and lifts, operating theatre, &c., with four cross-shaped projecting ward blocks. The wards are 86ft. long by 25ft. wide and 12ft. 6ins. high, accommodating 24 beds each. In all there are about 300 beds. The building was designed by the late Mr. Alfred Waterhouse, and has been carried to completion by his son, Mr. Paul Waterhouse.

SOME VIEWS OF PROF. LETHABY.

We extract the following from an interview with Prof. W. R. Lethaby, published in the "Tribune" last week :—

"From all I hear the Americans are generations in front of us in methods of planning cities. Washington, for instance, is not a jumble of streets and houses, but a magnificent unit. Still more, the French and the Germans have a sense of order. They think in cities, not in details and fragments. Berlin, although rather too formal and almost oppressive in its severe adherence to geometry, is nevertheless an impressive lesson in architectural planning on a great scale.

Aesthetic Gasometers.

"One does not like to decry one's own city. Still, one must confess that London, in spite of fine 'bits,' is still an ugly city. It is almost depressing to come back to London from abroad. Of course, many people who profess the artistic temperament pretend to see a beauty in its squalor. You yourself say how fine the vista of the Strand looks from the top of an omnibus, with all its colour when the lamps are lit. There may be beauty in it, but it is mere decadence all the same. It reminds me of a story about a lady and William Morris. 'Oh, Mr. Morris,' she said, 'I saw a gasometer in the fog last night, and it seemed like a golden crown of glory!' Mr. Morris looked at her.

"The Strand! Good heavens, what is it? The high street of early Johannesburg, or some shanty village in the West, would not be more of a hotch-potch of mean houses and big buildings—a highway of disorder. And yet it is the chief thoroughfare of the city from West to East.

"What we want above all in London, as Mr. Norman Shaw has pointed out, is a general plan to grow upon, however slow that growth may be.

Neglected Genius.

"It is a little disheartening to remember how we have wasted our best abilities in relation to the public service. Thus Pugin, our greatest genius in the nineteenth century, only had an opportunity as a ghost to Sir Charles Barry: Cockerell, the most scholarly designer of the century, had no public work at all: and Alfred Stevens, a man who could have done anything in the combination of sculpture with architecture, was worried to death over one tomb—the tomb of Wellington in St. Paul's. Burne-Jones, Morris, Watts, have left us nothing. They would have given freely, but they were not asked. Watts's most noble statue of Physical Energy, of which there was some rumour, two or three years ago, that a copy might be obtained for London, seems to have been entirely forgotten.

"The authorities in some other countries look upon architecture and the beautifying of their cities as a high manifestation of patriotism. There is but little of that spirit in this country.

Whitewashing the Tower.

"A visit to the Tower is a dreary experience, which takes the romance out of what might become the most impressive building in the kingdom. The Tower is the great Castle of London, the finest piece of military architecture of the eleventh century in Europe. I would like to see it made into the 'White Tower' once more by whitewash; indeed, I would recommend much whitewash for general use.

London Railway Stations.

"Our railway stations must be the worst in the world. The pattern of disorder set at Dover seems to rule over the whole of London. Everything is temporary, save at Euston and St. Pancras. Euston, indeed, is so fine that they don't know how to use it, and most of the work is done away from the Great Hall—which Watts offered to paint—in higgledy-piggledy annexes. In Paris all railway stations are worthy public buildings. The North Station is the work of one of their greatest architects, the station for the Lyons Railway is splendid, and that for the Orleans Railway on the Quai d'Orsay is probably the most interesting building erected in Europe during the last decade."

A.A. CONVERSAZIONE.

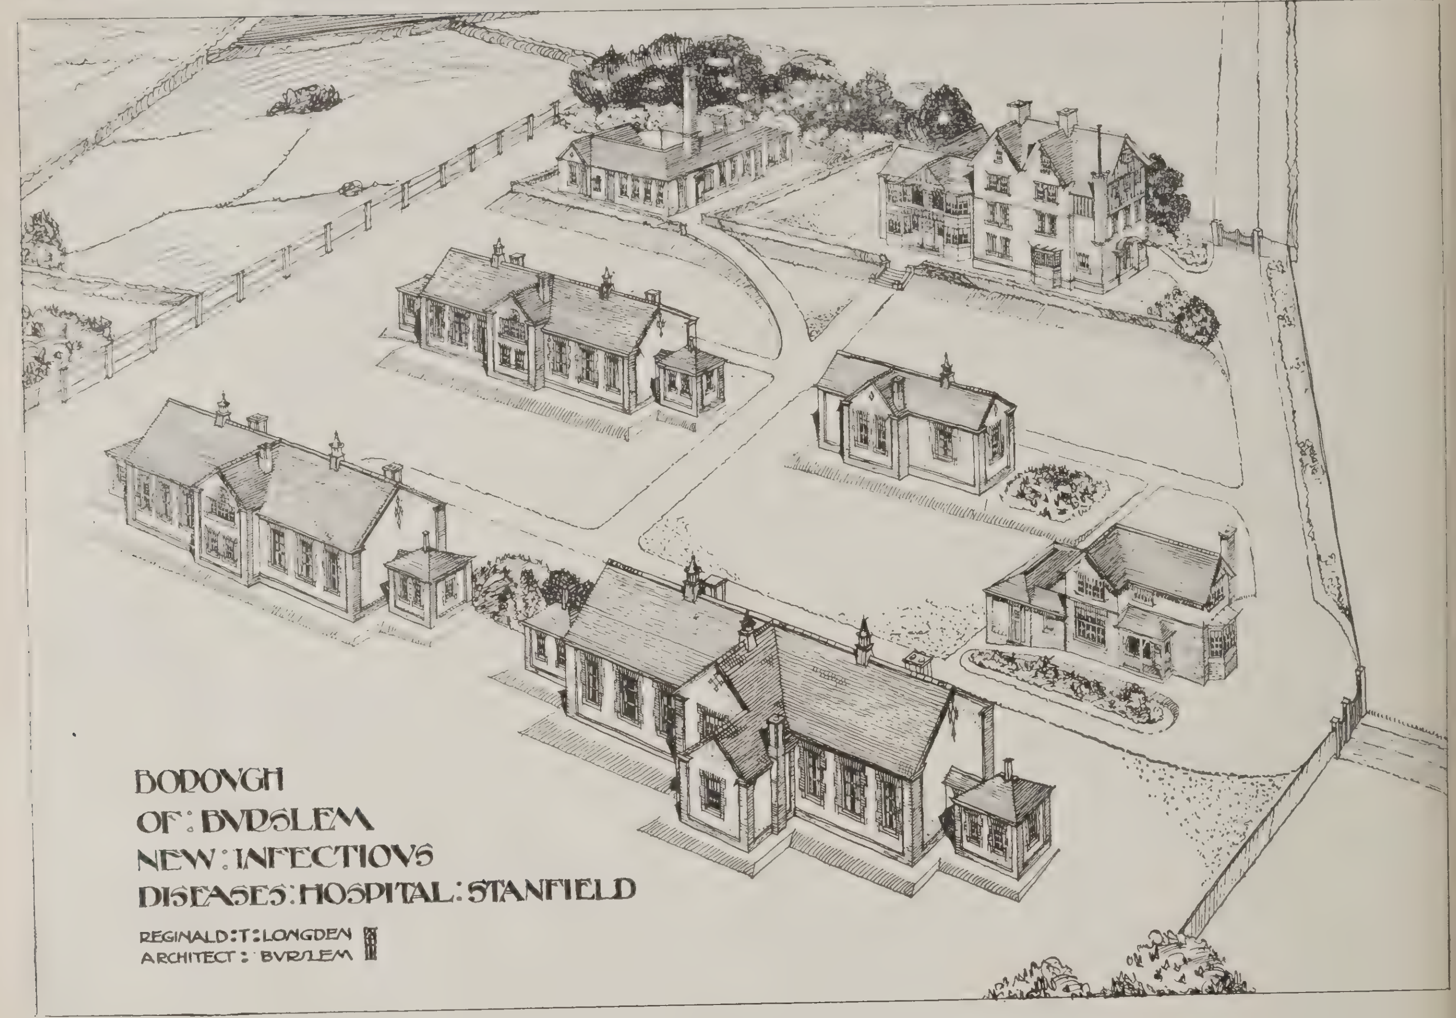
The Architectural Association Conversazione held on Thursday evening at 18, Tufton Street, Westminster, was a great success. Between 500 and 600 guests were received by the president, Mr. R. S. Balfour, and Mrs. Kenneth Balfour. Excellent music was provided by the A.A. Musical Society and Choral Society, assisted by Miss Beatrice Dunn, and in the "Long Gallery" on the first floor were exhibited some very interesting collections of drawings, sculpture, stained glass, silver ware and enamels, as well as a collection of Japanese swords, daggers, &c., lent by Mr. Matt. Garbutt; while on the second floor were shown drawings done in the School of Architecture, together with photographs taken on the annual excursion by Mr. A. W. Hennings, travelling studentship drawings by Mr. A. Winter Rose, and some very interesting photographs of Grecian buildings by Mr. Ronald P. Jones. These collections are well worth seeing. They are on exhibition all this week up to one o'clock on Saturday. Among the pencil sketches are some exquisite examples by Mr. Reginald Blomfield, some clever etchings by Mr. Ralph Knott, and other interesting drawings by the late Mr. J. Burgess, Mr. Walter Millard, Mr. Walter Cave, Mr. J. B. Fulton, Mr. C. E. Mallows, Sir Aston Webb and others; while in the Sculpture section is shown work by Mr. Goscombe John, Mr. Derwent Wood, Mr. Lynn Jenkins, Mr. Drury, Prof. Lanteri, Prof. Moira, Mr. Hodge, Mr. Schenck, Mr. Roscoe Mullins, &c. The stained glass includes examples by Mr. Silvester Sparrow, Mr. Whall, Mr. Spence, Mr. Arnold, Messrs. Bryans and Webb, and Mr. Dudley Forsyth.

The evening was also the occasion of the appearance of

"Tthe Purple Patch"

in its "fifth spasm." We were disappointed, however, to find that it had fallen from its high estate, for, with the exception of one or two "Limericks" and an amusing conversation on the telephone between a lady student and others, there is nothing very clever in it. We take the following extract from the telephone conversation :—

> "They all say I'm getting on awfully well. No; they won't let me learn about drains, and I do so want to know what a mantrap is, or whatever you call the horrid thing. Oh, but we often go out, Last week we went to see a perfect duck of a building—crushed strawberry brick, trimmed with old gold stonework, and such a beautiful Eu-de-Nil roof, with teeny-weeny little dormer windows."



BURSLEM ISOLATION HOSPITAL.

The new Burslem infectious diseases hospital which was opened recently at Stanfield occupies a site with an area of between six and seven acres. The site has a decided slope from east to west, thus enabling the buildings to be grouped in terraces, and giving the advantages of increased light and air. The planning of the buildings generally has been ruled to a certain degree by the fact that it was desired to use the existing residence on the site as a part of the new administrative block.

The main entrance is on the south side of the site, and is approached by way of the Hamil Road and Lorne Street. A porter's lodge has been erected in immediate conjunction with this entrance.

The blocks for the treatment of patients are grouped in the rear of the lodge, and provide total accommodation for 40 beds. These may, however, be supplemented by the addition of about 48 cots in case of epidemic, as ample room has been provided to meet the Local Government Board's requirements should such a contingency arise. These pavilions are four in number, there being a 12-bed typhoid fever pavilion, a 12-bed scarlet fever pavilion, a 13-bed diphtheria pavilion, and a 3-bed isolation pavilion. Each 6-bed ward is 36ft. by 26ft., and 13ft. high, giving a floor area of 156ft. and a cubical air space of 2,028ft. per patient, which is rather in excess of the Local Government Board's requirements. The wall surfaces and ceiling are plastered with Adamant, and have a hard and impervious surface. All angles of walls, ceilings, windows, doors, &c., throughout are plastered in the form of a hollow cove, allowing no lodgment whatever for dust or crevices in which dirt or germs can accumulate. The angle between the floor and wall is executed in light-green glazed bricks with coved hollow angle and tight joints. The floor is laid in bone-dry pitch-pine boarding, with secret-nailed joints, and the whole is finished with a perfectly smooth and polished surface. The wards are heated by means of a centrally-placed hot-air stove. At the end of each ward, a cross-ventilated passage gives access to an annexe, which comprises bath-room, w.c., and sink. The bath-room contains a specially constructed bath on wheels with india-rubber tyres, so that it may be wheeled to the bedside of the patient, or, of course, used in the bathroom. Each annexe has tiled floors and a white-tiled dado, executed by Messrs. Wade, of Burslem. A small low-pressure hot-water heating apparatus has been installed in each annexe by Messrs. Tagg & Co., of Newcastle, which serves both for heating purposes and the hot-water supply for bath, sink, &c.

On the first floor of each block and approached by a staircase from the hall is a large playroom for convalescent patients fitted up with cupboards for toys, &c., and heated by well-fires.

The single-bed ward of the diphtheria pavilion has been added for the reception of paying patients or for operations necessitated in critical cases, and is carried out as an annexe off one of the main wards.

The laundry and disinfecting block receives the disinfected linen and passes it into a steam disinfector, and thence to the disinfected linen-room and laundry. The receiving-room of this block is fitted with sorting bins, and the washing-room has a modern plant installed by Messrs. Manlove, Alliott & Co., Nottingham. From the washing-room and store the clothes are passed into the ironing-room, and thence to the delivery-room. The mortuary building is near to the laundry, and comprises the dead-house, *post mortem*-room, and viewing passage.

The patients as cured are passed into the discharge block, which is situated at the rear of the lodge and contains undressing, bath and dressing rooms.

The administrative block has very ample accommodation for all staff purposes and has been so designed as to meet the requirements of the hospital should extensions of the ward blocks be necessary. The existing house has been adapted and altered to the requirements of the cooking and servants' department, and a large addition has been built to the south for the matron and nurses. The night nurses occupy the second floor, which has seven bedrooms additional, store for linen in use, bath-room, &c. The third floor comprises a large box-room and tank-room, which contains the water-tanks for the whole institution.

The buildings are faced with Messrs. Boulton & Co.'s (Longport) red facing bricks, relieved by broad stretches of cement rough-cast. The roofs are of Messrs. Stanley Brothers' red-brindled tiles, and the main gables of the administrative block are carried out in half-timber. The woodwork and ironwork are painted outside in green, while inside the woodwork is stained in green and varnished. Electric lighting has been installed throughout. The whole of the ironmongery has been specially made to the architect's designs by Mr. James Gibbons, of Wolverhampton.

The drainage of the institution has received special attention, and separate systems have been laid for sewage and surface water respectively. Each block is cut off from all others by intercepting chambers and traps. The sewage is bacterially treated on the site, the effluent being turned into a ditch near by.

The general contractors were Messrs. J. H. Broadhurst & Sons, of Burslem. Messrs. Doulton and Co. supplied the hot-air stoves, and have supplied the whole of the sanitary fittings, which are of special hospital pattern. The well-fire and bedroom grates have been supplied by Messrs. Shaw & Adams, of Tunstall, and the whole of the ranges by Messrs. Pidduck & Beardmore, of Burslem.

It is expected that the total cost of the hospital, inclusive of the cost of the land, will be between £10,000 and £11,000. The architect is Mr. Reginald T. Longden, of Moorland Road, Burslem. Mr. Mark Simpson, building inspector to the Corporation, acted as clerk of works.

Correspondence.

Misrepresentations about "Velure" Paint.

To the Editor of The Builders' Journal.

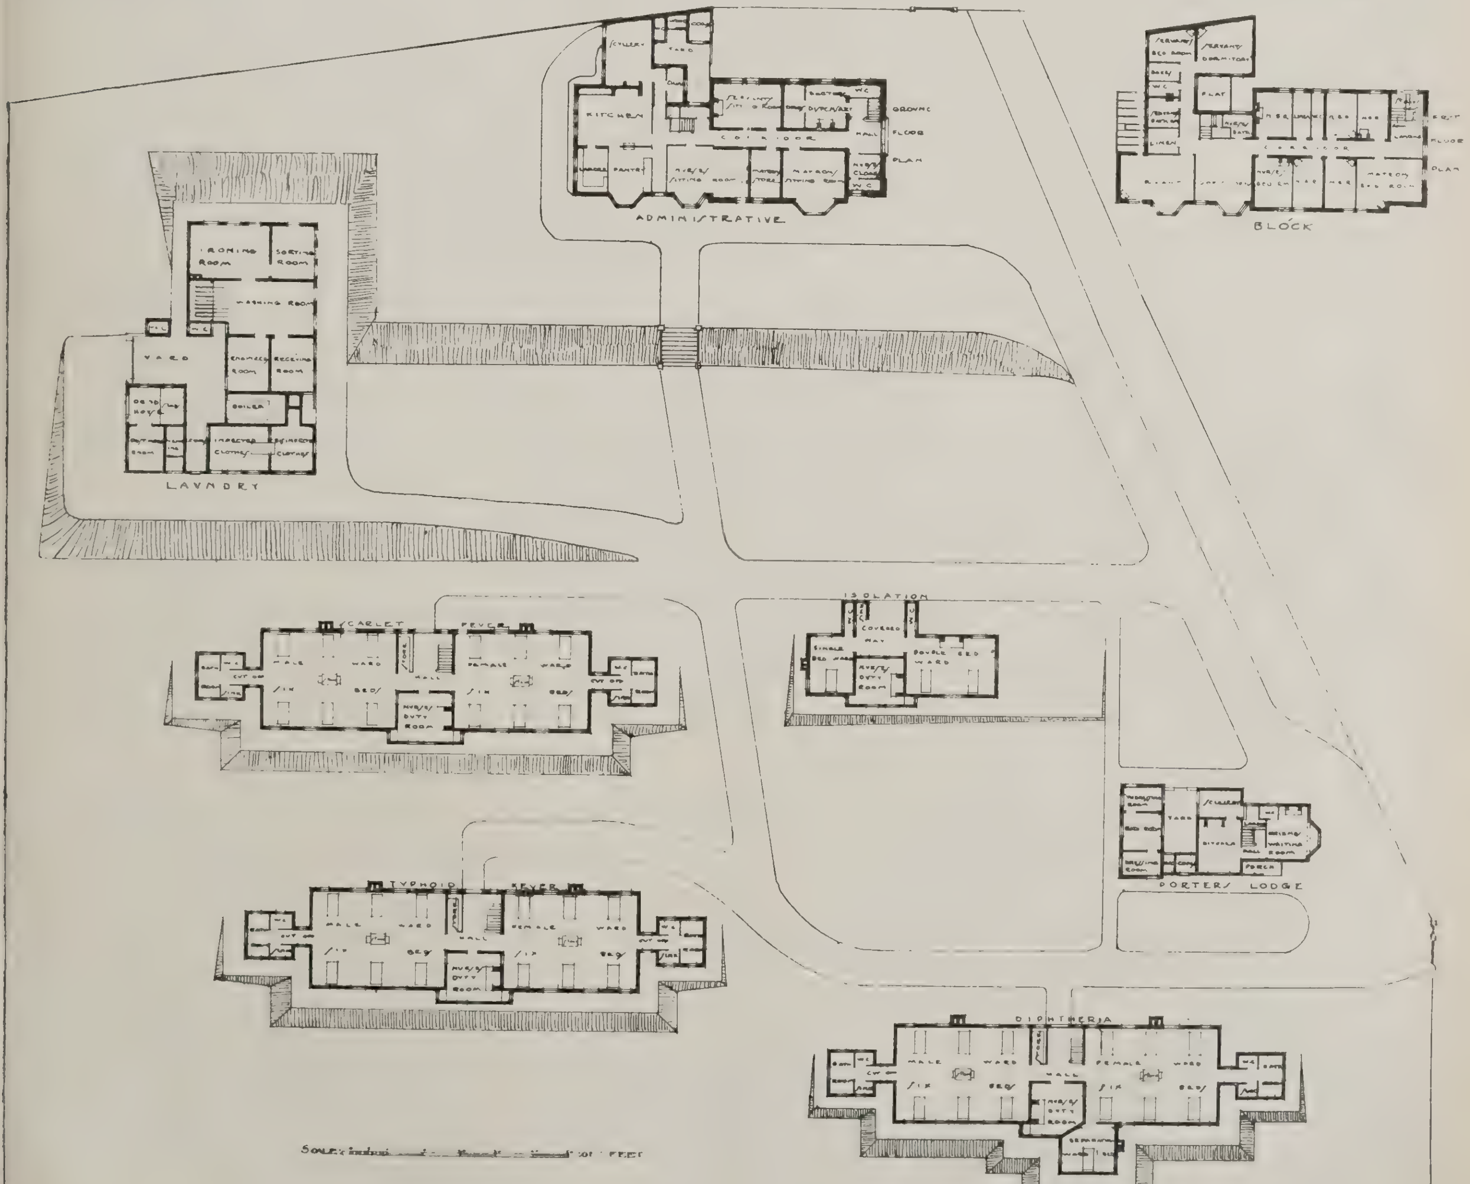
Sir,—We desire to make known certain methods which appear to be creeping into the paint business.

Some years ago we placed "Velure" on the market. It has commanded a large sale and a great reputation, with the usual result—that many articles have since been introduced claiming similar properties. For the most part competitors have been honourable firms, selling their goods, as we have done, on their own merits. But there is one whose plan has been as follows:—Knowing the reputation of "Velure," they have, wherever their representatives have found it on sale or in use, tried to persuade our customers not that their paint was as good or better, which, if they believed it, they were perfectly entitled to assert, but that theirs is *the same article* as "Velure." Of course, the statements are not straightforwardly made in such a form as to enable us to test them in a law court, but the impression has been conveyed in different ways, and, in some cases with success, to some of our clients, who have bought at a lower price an article which they thought was "Velure" under another name, and only discovered in use to their cost how inferior it was.

Only last week a customer in the Midlands informed one of our representatives that the article we refer to was "made in the same factory as 'Velure.'" On taxing the local agent with this falsehood the statement was of course denied, and our client's impression explained away on a totally different ground. The impression has been given all the same.

Another client of ours told us he understood that the proprietors of this article were the original makers of "Velure," and that they had deferred bringing out their paint until their contract for supplying "Velure" had expired, the inference being that the two articles were identical. To another the same statement was made about the medium used for making "Velure." Of course, both alike are untrue. "Velure" and its medium have always been made in the same factory, which has been repeatedly enlarged for the growing trade. They are as incapable of making "Velure" as, apparently, of making a legitimate trade for their paint on its own merits, so they use a competitor's reputation to steal that competitor's business.

For some time we have treated this illegitimate competition with contempt, but owing to the persistence of such reports and the elusive nature of the fictions, which make it impossible to bring them to the test of an action at



INFECTIOUS DISEASES HOSPITAL, STANFIELD, BURSLEM.

law, may we ask the publicity of your columns to protect our customers, many of whom read your paper, by warning them that all statements as to "Velure" being the same as any other paint are absolutely untrue.—Yours truly,

C. CHANCELLOR & CO.
13, CLERKENWELL ROAD, E.C.

Building Stone near Tavistock

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I notice on p. 213 of your issue for October 31st "H. Y. M." states that "limestone from Pomphlette is suitable for window dressings, *tracery*, &c." This is wrong, as it is quite impossible to do tracery work in Plymouth limestone. The best of this stone is supplied by Messrs. Sparrow & Co. from their quarry at Radford, Hooe Lake, which is near Pomphlette, and is generally used for nobbled facings, and worked either to a quarry or tooled face. Window dressings and tracery here are worked either in Portland, Ham Hill or Doulting stone, or, if cost is not a question, in granite. The general facing for buildings around Tavistock is polyphant stone from a quarry near there: this is a soft stone when quarried, and easily worked, and it hardens with exposure.—Yours truly,

PLYMOUTH. A. W. LETHBRIDGE.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Stresses from Cantilever Supporting a Gallery.

MACCLESFIELD.—X. writes: "The diagram represents a cantilever supporting seats. The distributed load on one part is 4 tons, and 6 tons on the other. What pressures do these loads cause upon the wall and column respectively?"

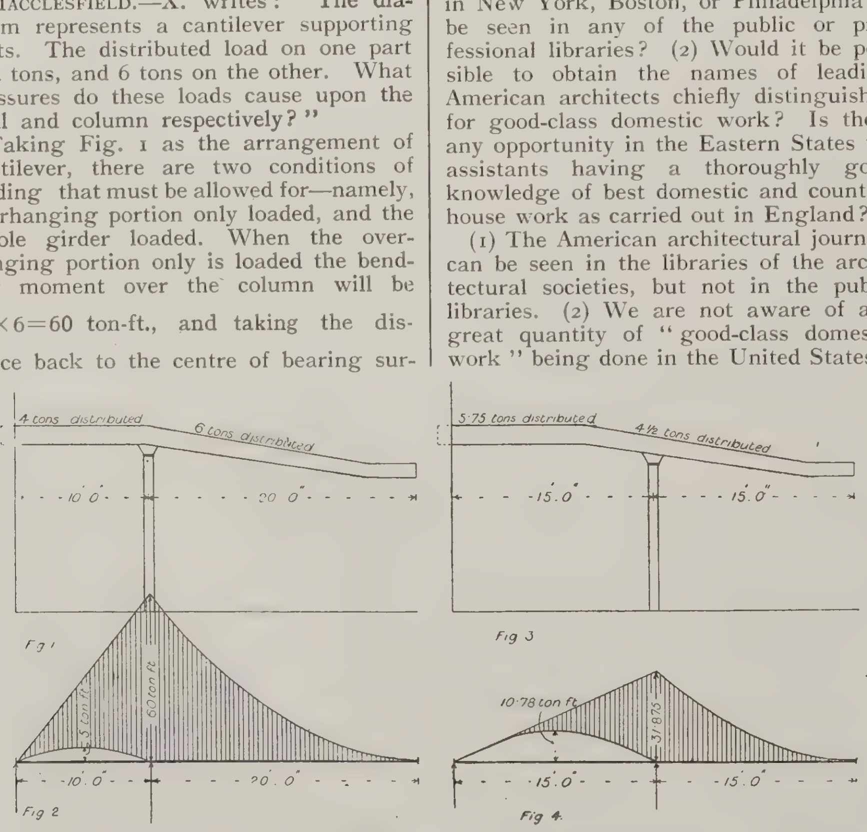
Taking Fig. 1 as the arrangement of cantilever, there are two conditions of loading that must be allowed for—namely, overhanging portion only loaded, and the whole girder loaded. When the overhanging portion only is loaded the bending moment over the column will be $\frac{20}{2}\times 6=60$ ton-ft., and taking the distance back to the centre of bearing surface in wall as 10ft. 6ins., the upward pull at wall will be $\frac{60}{10.5}=5.7$ tons, which is the measure of the anchorage required. The load on the column will then be $6+5.7=11.7$ tons. When the whole length of girder is loaded, the bending moment diagram will be as Fig. 2, the upward pull on anchorage will be $\frac{6\times 10-4\times 5}{10.5}=3.8$ tons, and the load on column $6+4+3.8=13.8$ tons. With a maximum bending moment of 60 ton-ft. a rolled steel joist with a tabular value $60\times 8=480$ will be required. This will be given by a B.S.B. 27, 16ins. by 6ins. by 62 lbs. rolled steel joist. Considerable economy may be gained by increasing the distance between wall and column from 10ft. as at present to 15ft. and making a corresponding reduction in the overhanging portion, as in Fig. 3. With this alteration the loading would approximately be $5\frac{3}{4}$ tons between column and wall, and $4\frac{1}{4}$ tons on outer end. Then the maximum upward pull at anchorage would be $4.25\times\frac{15}{2}-5.75\times\frac{15}{2}\div 10.5=-1.07$ tons, and a minus pull means a push, so that it will be a downward load on wall of, say, 1 ton. The maximum load on column will be $4.25+5.75-1.07=8.93$, say, 9 tons; and the maximum bending moment as in Fig. $4=4.25\times\frac{15}{2}=31.875$, say, 32 ton-feet; the section required to meet this would be that corresponding to the tabular value $32\times 8=256$ and given by a B.S.B. 21, 12ins. by 6ins. by 44lbs. rolled steel joist. With built-up beams the same relative advantages would appear.

HENRY ADAMS.

Architecture in the United States.

ABINGDON.—XIT writes: "(1) Are the American architectural journals published in New York, Boston, or Philadelphia to be seen in any of the public or professional libraries? (2) Would it be possible to obtain the names of leading American architects chiefly distinguished for good-class domestic work? Is there any opportunity in the Eastern States for assistants having a thoroughly good knowledge of best domestic and country-house work as carried out in England?"

(1) The American architectural journals can be seen in the libraries of the architectural societies, but not in the public libraries. (2) We are not aware of any great quantity of "good-class domestic work" being done in the United States—taking an English standard. There are, however, a few men—such as Wilson Eyre, Frank B. Wright, and Elmer Grey—who are producing excellent work. You had better look over back volumes of the American papers and form your own opinion. As to opportunities for assistants, we would refer you to the leader in our issue for October 31st.



STRESSES FROM CANTILEVER SUPPORTING A GALLERY.

Fees for Preparing Plans and Elevations for Builders.

LONDON.—SUBSCRIBER writes: "Please give a scale of charges for preparing plans and elevations of houses for builders."

See "Specification" (price 3s. 3d. post free from these offices). We think $2\frac{1}{2}$ per cent. sufficient for plans and elevations.

Building Construction Examinations.

GLASTONBURY.—F.O.J. writes: "Have the South Kensington building construction examinations any connection with those of the R.I.B.A.?"

The two examinations are entirely distinct: they have no connection with one another.

Notes and News

Mr. Reginald T. Blomfield, A.R.A., has been elected an Honorary Fellow of Exeter College, Oxford.

The R.I.B.A. Kalendar for 1906-7 has just been issued from 9, Conduit Street, W., price 2/6.

Sir A. Brumwell Thomas, included in last week's birthday honours list, was the architect of the new City Hall at Belfast and the new Town Hall at Woolwich.

"The Byzantine Churches of Constantinople" formed the subject of a lecture delivered by Prof. Charles Gourlay, B.Sc., A.R.I.B.A., before the meeting of the Glasgow Technical College Architectural Craftsmen's Society on November 2nd.

A New Hippodrome has been erected at Putney. It accommodates 2,000 people. Messrs. Waring and Gillow have been responsible for the upholstering, while the warming and ventilation has been carried out by Messrs. Hendry and Pattisson, of Lavender Hill, S.W.

Dispute about Walsall Municipal Buildings.—Litigation is pending over the erection of the new municipal buildings at Walsall. The corporation has resolved to defend an action by Messrs. Armitage and Hodgson, contractors, Leeds, for a disputed amount of £2,846, and if necessary to sue the architect, Mr. James S. Gibson, F.R.I.B.A., for the amount and all costs for giving orders for extra works without authority.

The Architectural Treatment of Stonework.—At last Thursday's meeting of the Sheffield Society of Architects and Surveyors Mr. W. J. Hale, F.R.I.B.A., delivered a lecture on "The Architectural Treatment of Stonework," being the first of a series dealing with the treatment of materials used in building. Mr. Hale laid stress on the necessity for materials to be treated according to their nature, qualities and limitations, but, quoting Ruskin that "all architecture proposes an effect on the human mind, not merely a service to the human frame," said that although a particular feature might not be capable of defence on strictly utilitarian grounds, it might still justify its existence as satisfying a man's trained artistic perceptions.

Notes on Competitions

List of Competitions Open.

Deposit for conditions given where known.

DATE OF DELIVERY	COMPETITION.
Nov. 30	LIBRARY AT NEWTON-IN-MAKERFIELD.—Cost £4,000. Particulars from C. Cole, clerk to U.D.C., Town Hall, Earlestown, Lancs. No deposit.
Dec. 12	LAY-OUT OF RIDDRIE ESTATE, GLASGOW.—Premiums of £75, £50 and £25. Particulars from A. W. Myles, town clerk, City Chambers, Glasgow. No deposit.
Dec. 31	DUAL SECONDARY SCHOOL AT GOOLE.—Premiums £50 and £25. Particulars from James W. Johnson, clerk to Governors, Council Offices, Goole. Deposit £2 2s.
Dec. 31	NURSES' HOME AT GENERAL HOSPITAL, WOLVERHAMPTON.—Particulars from J. Stephen Neil, House Governor and Secretary, General Hospital, Wolverhampton. No deposit.
Dec. 31	BATHS AT ASHTON-IN-MAKERFIELD.—Limited to architects in Wigan and Leigh Poor Law Unions. Particulars from A. Sykes, clerk, Council Offices, Ashton-in-Makerfield. No deposit.
1907 Jan. 19	LIBRARY AT PLYMOUTH.—Premiums £50, £30 and £20. MUSEUM AND ART GALLERY AT PLYMOUTH. Premiums £25, £20 and £10. Limited to local architects. Particulars from Borough Librarian, Plymouth.
Feb. 1	CHILDREN'S HOSPITAL AT SUNDERLAND.—Premiums of £100, £50 and £25. Particulars from T. Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland. Deposit £1 1s.
No date.	ELEMENTARY SCHOOL AT SLOUGH, for 600 children.—Limited to local architects. Particulars from C. G. Watkins, Education Secretary, Education Offices, Aylesbury, to whom applications must be sent by Nov. 30th.

Secondary School, Goole.

When a deposit of two guineas is required for a set of conditions which neither cajoleries nor promises of immediate return are able to obtain on approval, the ardent imagination of the architect pictures nothing less than a gilt-lettered volume of particulars and instructions for an edifice to accommodate many thousand scholars. The scant pages and diminutive block plan which duly appear in exchange for the deposit are provocative of no little surprise, not only on account of their extreme meagreness, but by reason of the comparative insignificance of the building required and of the appearance of a clause in which the School Governors "do not bind themselves to carry out the erection of the proposed school, or to employ the architect who is author of the plans selected for the first prize. The selected plans, with all tracings, sections, detailed drawings, and specifications relating thereto, shall, upon payment by cheque of the first and second premiums"—£50 and £25—"immediately become the absolute property of the Governors aforesaid, and under no condition will be returnable to the competing architects who designed them." This clause must be regarded very seriously, for, as it stands, the competition may become nothing more than a contest for premiums. It may be remembered that the conditions of the Hackney library competition, last December, had a similar clause as to the promoters not binding themselves to appoint the architect placed first by the assessor, but in that case a verbal assurance was given that there was no intention of applying the condition except in extreme urgency. Unless a similar assurance can be obtained from Goole, the competition had better be left severely alone. The conditions are interesting in that they contain evidence of the progress of events. This consists of three clauses printed in red at the end of the instructions. They have obviously been added since the original conditions were issued, as is shown by the comparison of an original set with one of later date. Formerly the Governors were to determine the competition, but reserved the right to obtain an independent architect to act as assessor; now, the Governors "shall appoint an independent professional architect, who shall act as assessor, to determine the competition, whose decision shall be final and binding." Formerly there was no block plan; now, "block plan containing information in regard to the levels, drainage and gas and water supply, enclosed." A block plan, as before stated, diminutive but useful. The school is to accommodate 300 students, with provision for technical and evening classes. There is no limit of cost, but economy will receive favourable consideration. A satisfactory feature is the provision of a safety margin of fifteen per cent., an unsatisfactory one is the adoption of the old-fashioned nom-de-plume method of identification. The School Governors cannot be congratulated upon their choice of models for conditions, which has resulted in the issuing and subsequent revision of a set of instructions and particulars which are still imperfect.

Nurses' Home, Wolverhampton.

A supplementary list of instructions to architects has been issued, which is significant, even in this comparatively satisfactory competition, of an abandonment on the part of competitors of the old *laisser faire* attitude, and an attempt on their part to induce approximate perfection in conditions under which they have to work. The supplementary instructions, furthermore, read pleasantly and appear to give evidence of an intention of fair dealing on the part of the promoters. The most important clause, perhaps, is one which reads "The author of the design placed first will be employed to carry out the work at the usual fee of 5 per cent. If, however, after the working drawings have been prepared no substantial builder can be found to carry out the work within 10 per cent. of the amount stated in the instructions, the Board reserve the right to pay the architect a sum fixed by the assessor in full consideration of all services." Another most satisfactory clause is "The award will be adhered to, unless there is some unforeseen or valid objection to the employment of the author of the selected design." These conditions are particularly interesting at the present moment, for they stand in sharp contrast to those of Goole, containing, as they do, all the desirable features which are lacking in the latter.

Dutch Architects and the Palace of Peace.

The Dutch architects who took part in the competition for the Palace of Peace at the Hague have made a protest against the jury's selection of M. Cordonnier's design, the cost of which exceeds the amount available. They demand that the award shall be set aside, basing their claim on the jury's admission that the conditions of the competition had not been adhered to.

Elementary School, Blackburn.

The competition for an elementary school at Blackburn, among architects practising in the county borough, has been decided in favour of Messrs. Cheers and Smith, of Blackburn, to whom the first premium of £30 is awarded. The school is to accommodate 280 scholars and is planned with a "central hall" having classrooms arranged on the front and at the sides.

Hither Green Library.

In the competition for a branch library to be built at Hither Green by the Lewisham Borough Council, at a cost of £4,500, twelve designs were submitted by local architects, and the design of Mr. Henry Hopton, of Catford, has been selected.

Baths at Birmingham.

It is proposed to invite competitive designs for baths to be built at Nechell's Park Road, Birmingham.

IN PARLIAMENT.

(By our Press Gallery Representative.)

Fatal Accidents in Quarries.

In the House of Commons last week Mr. Ellis Davies asked the Secretary of State for the Home Department what steps, if any, had been taken in view of the statement on p. 99 of the Reports on Mines and Quarries for 1905 (Labour) that accidents by falls would be reduced if more quarries were worked in steps or galleries instead of with a vertically continuous face of great height; whether he was aware that 33 per cent. of fatal accidents in quarries were due to falls; and whether, in those circumstances, the Report had been brought to the attention of quarry owners with a view to their adopting the gallery system wherever practicable.

Mr. Gladstone, in reply, said no special steps had been taken to bring this particular remark to the notice of the quarry owners. The Report itself was widely circulated by the Home Office and was reviewed at length in the trade papers. The point was, no doubt, present to the minds of all the inspectors, but they had no power to direct the adoption of any particular method of working. Special precautions against falls were contained in Nos. 1, 2 and 3 of the code of special rules for quarries which had been established at a large number of quarries. These were enforced by the inspectors.

English Stone for Irish Buildings.

Mr. William Redmond asked the Chief Secretary to the Lord Lieutenant of Ireland if he was aware that it was proposed to build the Royal College of Science in Dublin with stone imported from England; and, if so, whether he would arrange to have the stone from Clare, Donegal, and other portions of Ireland, used in this new public building, in order to help industry in Ireland.

Mr. McKenna, who replied on behalf of the Treasury, said he was informed that the brick and stone now being used in the construction of the lower storey of the new Royal College of Science, Dublin, were exclusively Irish. The designs and specifications for the remainder of the building were not yet complete, but the architects of the building had made a special study of Irish building materials and had come to the conclusion that, subject to prices being satisfactory, large quantities of them could be used in the building. The experience since gained in the construction of the lower storey justified, he believed, the anticipation that, subject to satisfactory prices and delivery, large quantities of Irish brick and stone would be used in the superstructure.

Combinations in Cement and Other Products.

Mr. Chiozza Money asked the President of the Board of Trade whether his attention had been directed to the fact that great combinations of capital, or price rings, or both, had been formed in connection with the manufacture of iron and steel, wallpaper, cement, and other products, with the result that monopolies or quasi-monopolies had been created; and whether he would consider the advisability of introducing legislation to establish public competition with the monopolists or to secure public control of the monopolised trades.

Mr. Lloyd George, in reply, said the Board of Trade was fully alive to the importance of the matter, but he was not at present prepared to introduce legislation on the subject.

The Fair Wages Clause.

Mr. Harcourt, First Commissioner of Works, informed Mr. O'Grady that it had been the practice of his Department for years past to take such measures as were considered best to secure the observance of the fair wages resolution of the House of Commons, but he had recently caused specific clauses for that purpose to be inserted in certain contracts in which they had not been so categorically expressed before.

Our Plates

The parsonage house at Thurlstone, near Penistone, Sheffield, occupies a steep hill site and is built of local rubble walling, with stone to windows, copings, &c., and stone slates on the roof. Mr. Edgar Wood, A.R.I.B.A., of Manchester, was the architect (also the delineator of the sketch reproduced) and Messrs. J. & F. Turner were the builders.

The design for a free library by Mr. J. Henry Sellars, of Manchester, was submitted in competition some time ago; it has not been carried out.

The house at Oxted, Surrey, for E. Charrington, Esq., was completed about two years ago. The external walls are almost entirely of oak-framing, backed with brickwork. The plinth is of local rubble sandstone, and the roofs are covered with old tiles. The contractors were Messrs. J. T. Williams & Sons, of Oxted, and the architect was Mr. C. M. O. Scott, of London.

A Correction.—A typographical error occurred in an article on Electric Lifts on p. 219 of our issue for October 31st. It was there stated that "To-day about 1,200 Flohr lifts are in use all over the world." The number should have been 12,000.

Ulster Society of Architects.—At the last meeting of this Society it was decided that a committee of members in Derry and district should be formed under the auspices of the Society. Considerable discussion took place in regard to the new Labourers (Ireland) Bill so far as it affected architects, and it was decided to forward to the Local Government Board the resolution passed at the annual meeting of the Society in December last, calling attention to the undesirability of salaried officials (surveyors especially) acting as architects in competition with local practitioners.

FLOOR TESTS.

Two interesting and instructive tests on fire-resisting floors constructed on the Kleine patent system were carried out at No. 19, Irongate Wharf Road, Paddington Basin, London, W., on October 31st, under the direction of Mr. A. T. Walmisley, M.I.C.E. These tests consisted in the one case of loading to destruction and in the other of the dropping of a weight from a height in order to show the resistance of the floor-construction to impact.

The Kleine system is a reinforced floor construction, in which flat iron rods are embedded in cement mortar between hollow brick blocks near the underside to take the tensional stresses, while concrete is placed upon the upper side of the brick blocks, in order to take the compressional stresses. The concrete is done away with when there are only small spans and light loads. In short, it is reinforced brick and concrete construction.

The advantages

offered by the hollow bricks are that the centering has to remain in position only a short time, the brick soffit dries quickly, so as to be ready for plastering immediately the centering is removed, reduction of weight, and deadening of sound.

The construction of the floor in the weight test was as shown in Fig. 1, which also represents the way the load was put on—this being the scientific method adopted at Charlottenburg, whereby an evenly-distributed load is accurately applied, and no opportunity given for arching to occur, as generally happens when loads are applied by means of bricks, bags of cement, &c. The patentees deserve every credit for advocating

a rational system of loading,

instead of the usual system, which only serves to deceive the unknowing and to lead those who see through the deception to become prejudiced against forms of construction which rely upon such tests.

As shown in Fig. 1, a portion of a floor 5ft. 3½ins. in width with a 12ft. clear span was supported on steel joists, 6ins. by 3ins., held in position by ballast concrete flanching on the top of dwarf walls 13½ins. wide. The soffit of the floor was thus 2ft. 7½ins. above the ground. This slab was separated by ½in. boarding from the adjoining portions, on each side measuring 1ft. 5½ins. in width, so that the centre portion might act independently. The side portions were adopted merely to show that there was no side thrust.

The floor was constructed of hollow bricks, measuring 6ins. by 4ins. by 10ins., running in rows, alternately placed so as to be 6ins. and 4ins. deep. Iron bars about 1¾ins. by ⅙in. thick were embedded in the centre of each longitudinal joint near the underside of the floor, their ends being turned at right angles against the outside ends of the bricks. There were 10 rods, and thus the proportion of reinforcement was about .4 per cent. Concrete was placed upon the top of the hollow bricks, so as to bring the depth of the floor slab up to 12ins. The cement mortar in which the bricks were laid and the rods embedded was proportioned 3 to 1. The concrete was proportioned 4 ballast, 2 sand and 1 cement. The floor was designed to sustain a safe load of 2cwt. per ft. super., with a factor of safety of 4.

The Loading.

A layer of sand, 6ins. deep, was spread over the central area of the slab and maintained in position by planks placed on edge. This sand served to evenly distribute the load. The loading was done with pig iron carefully weighed in batches and applied from a platform built round the slab, the pig iron being piled with intervening spaces, so as to avoid the possibility of a concealed arch, and so as to ensure absence of continuity.

The deflection was observed throughout the test, and it was nil up to 5.96cwts per sq. ft. When the load had been increased uniformly to 7.4cwts. per sq. ft. the deflection was $\frac{3}{20}$in. This was increased to ⅕ of an inch when the distributed load had become 25 tons, 1cwt., 1qr., 14lbs., or 7.89cwts. per sq. ft. Five minutes after this reading was taken the floor collapsed. This shows that the factor of safety of 4 was practically obtained, and the estimated strength proved correct. The appearance of the collapsed floor is shown in Fig. 2.

The Result.

Upon examination of the floor it was seen that the tension bars had pulled through the concrete at one end, and were unbroken; from the portions of the concrete it was obvious that this was not only of very poor composition, the voids not being all filled, but had never properly set. The aggregate was not a good one, and had been improperly mixed; the aggregate had been mixed wet, and the floor had been kept very wet just after construction, and for a good many days before the test it had been kept continually wet by reason of the rainy weather. Moisture is known to deleteriously affect adhesion. Unfortunately no direct test was made to

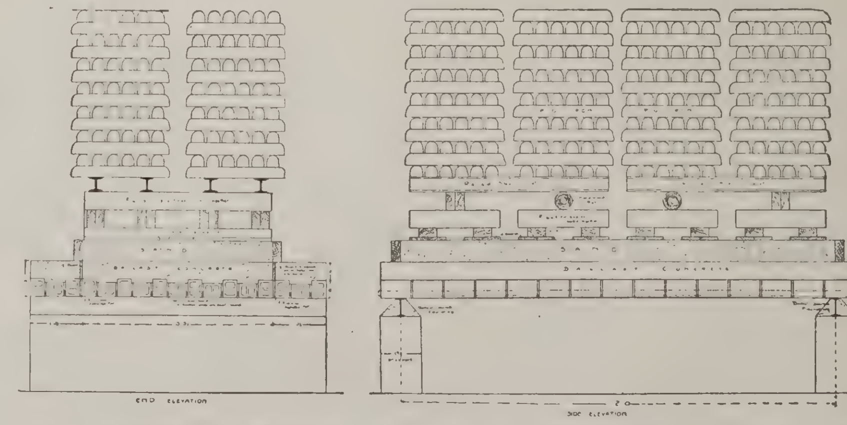

FIG. 1. SHOWING CONSTRUCTION OF FLOOR AND ARRANGEMENT OF WEIGHT TEST.

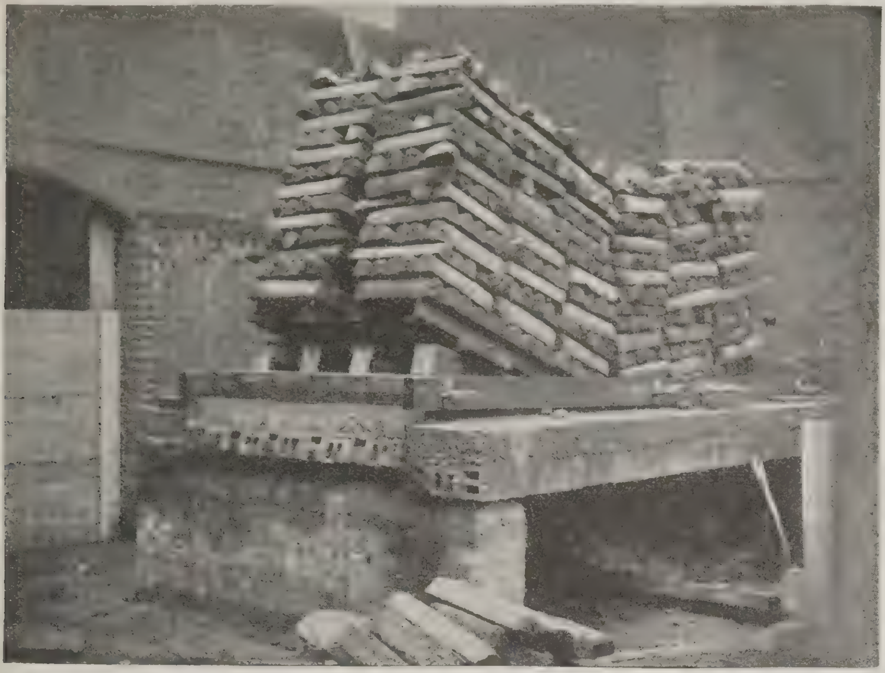

FIG. 2. THE COLLAPSED SLAB.

show the compressive strength of this concrete, and, although its weakness may easily have been the primary cause of failure, the fact of the rods having pulled through the concrete and not being ruptured would suggest that faulty adhesion was the primary cause, although the oblong section of these bars gave a large surface for adhesion, and it was probably not required to develop more than 20lbs. per sq. in. The other floor test permitted the rods to be examined, and we noticed there that the cement mortar in which the rods had been embedded had adhered very slightly to the rods in some parts. The weight test is particularly instructive in emphasising the importance of great care being taken in the proportions and choice of aggregates for reinforced concrete.

The Impact Test.

The impact test consisted in dropping a block of stone weighing 84lbs. from a height of 9ft., as shown in Fig. 3. The slab in this case had a clear span of 8ft. and was 3ft. 6ins. wide. There was no concrete on the upper surface of the hollow bricks. A uniformly distributed load of 4cwt. per sq. ft. was removed, and the weight was allowed to fall upon a 1in. layer of sand upon which the load had been standing. The result of the impact was simply an indentation of the sand. The sand was then removed and the first fall of the stone resulted in chipping the upper surface and producing a slight longitudinal crack. The second time the impact caused the bottom half of two bricks to fall off for a length of about 18ins., and the longitudinal crack to be emphasised. The third time the weight fell, a hole of about 8ins. square was made in the brick floor, but the iron bar remained intact and sustained the weight. This test was conducted in order to show that the Kleine floors are not liable to damage from falling weights while in course of construction. The longitudinal crack which occurred calls attention to the reason why reinforced concrete constructors early found the advisability of putting small transverse rods in floors liable to heavy concentrated loads. In the stronger Kleine floors, which would be necessary in such circumstances, the weight test showed that the deflection would be small and the upper surface of concrete might generally be relied upon to transmit a concentrated load far enough to avoid longitudinal cracks.

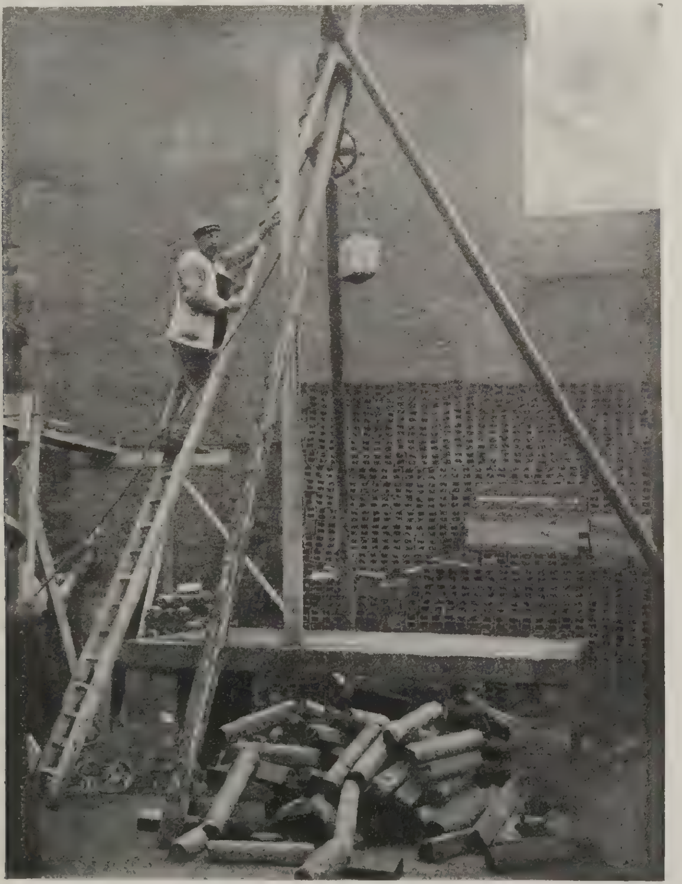

FIG. 3. IMPACT TEST.

It is obvious from these tests that the Kleine system of constructing fire-resisting floors is an excellent one and may be thoroughly relied upon if adequate precautions are taken in the placing of the tension rods and the mixing and proportioning of the concrete, and if the hollow bricks are made of porous terra-cotta. The first test for loading, if the concrete had been made to the patentees' specification, would have stood a much greater load.

We may call the attention of readers to the fact that the Kleine system of flooring is now being used throughout the Imperial Hotel, Russell Square, London, where it can be inspected by anyone interested.

Partnerships

[*The date when the partnership was dissolved is given in parenthesis where known.*]

SMYTH & DEARLE, quantity surveyors, London (June 30).

BADGER & POWER, builders and contractors, Birmingham (Oct. 16).

HARDY & KELLETT, joiners and builders, Denton (Oct. 17). Debts by J. Hardy.

J. BIRD & SON, brick manufacturers, &c., Ipswich (Oct. 1). Debts by F. Bird.

HENNELL & SON, architects and surveyors, London (Oct. 30). Debts by A. R. Hennell.

HIGGS & SPIERS, architects and surveyors, Leicester (Oct. 8). Debts by J. H. Higgs.

EBBS & BARTON, builders and contractors, etc., Norfolk (Oct. 19). Debts by W. H. Barton.

POOL & CO., builders' merchants, Wimbledon (Oct. 1). Debts by C. L. Peckham, who continues.

ROSE & ABBOTT, painters, plumbers and house decorators, Hanslope (Sept. 29). Debts by J. Rose.

JACKSON & BARKER, builders and house decorators, Hornsey (Sept. 29). Debts by A. B. Jackson.

MORTON & BAILEY, plasterers, Gorton (Oct. 11). Debts by J. Bailey, who continues in his own name.

BRAZELL & WHITTON, builders and contractors, West Hartlepool (Oct. 12). Debts by W. W. Brazell.

REPPEN & TOYNTON, plumbers, glaziers and gasfitters, Nottingham (Sept. 12). Debts by either partner.

TAYLOR & JACKSON, sanitary engineers, builders, &c., Oldham (Oct. 24). Debts by R. Jackson, who continues.

HOLT & GREAVES, painters and decorators, Leeds (Oct. 15). Debts by J. Holt, who continues in his own name.

R. H. & L. WILLCOCKS, builders and decorators, East Finchley (Oct. 11). Debts by R. H. Willcocks, who continues.

CONE & SMITH, builders and house decorators, Stamford Hill (Oct 30). Debts by W. H. Cone, who continues.

CROSS & BELL, builders and contractors, Chester (Sept. 30 as regards D. Cross). Debts by J. & D. Bell, who continue.

LIGHTHILL & CLARKE, timber merchants, Manchester (Aug. 31). Debts by L. Lighthill, who continues as L. Lighthill & Co.

S. D. ROBINS & R. WILSON, architects and surveyors, Sunderland (Oct. 1). Debts by R. Wilson, who continues in his own name.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 16. Newry.—*Erection of fences* at each of the nine houses at present being erected in the Rural District for the Newry No. 2 R.D.C. Persons tendering to quote at per Irish perch. Plans and specifications can be seen, and form of tender obtained, upon application to the Borough Engineer and Surveyor at the Town Hall, Church Row, Bethnal Green, any day between the hours of 10 a.m. and 4 p.m. Fair wages clause. Tenders, sealed and endorsed "Furnace," must be delivered to R. Voss, town clerk, Town Hall, Bethnal Green, E., not later than 12 noon on Nov. 20.

Nov. 20. Cleveleys.—*Erection of new public elementary school* at Cleveleys (near Fleetwood) to accommodate 300 scholars, for the Lanchashire Education Committee. The plans may be seen and bills of quantities obtained at the offices of H. Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on Nov. 20, sealed and endorsed, to H. Stonestreet, Education Offices, Blakiston Street West, Fleetwood.

Nov. 20. East Ham, E.—*Erection of school buildings* to accommodate 852 children, at Storey Street, North Woolwich, and for the construction of deep foundations. Each contractor must deposit a £50 Bank of England note, or crossed cheque of equal value, with his tender. Plans and specification may be seen, and forms of tender and any other information obtained, at the office of the committee's architect, R. L. Curtis, 11 and 12, Finsbury Square, London, E.C., on any weekday except Saturday between the hours of 10 and 5. Tenders on the printed form must be delivered to H. C. Padgett, secretary, Education Office, East Ham, E., not later than 4 p.m. on Nov. 20. Fair wages clause.

Nov. 20. London, S.E.—*Erection of a mortuary*, Coroner's Court, and other buildings on a site in Baildon Street and Watson Street, Deptford, according to the drawings and specifications prepared by H. T. Bonner, A.R.I.B.A., to be seen at the Town Clerk's office, Town Hall, New Cross Road, between 10 and 4 o'clock, Saturdays between 10 and 1. Bills of quantities prepared by A. Crocker, together with the conditions of contract, may be obtained from V. Orchard, town clerk, Town Hall, New Cross Road, S.E., on payment of £2 2s. Persons desirous of tendering must send in their names to the Town Clerk on or before Nov. 17. Tenders, sealed and endorsed "Mortuary and Coroner's Court," must be delivered to the Town Clerk in accordance with the Council's regulations as to the receipt of tenders, at the Town Hall not later than 4 p.m. on Nov. 20. Fair wages clause.

Nov. 21. Liskeard.—*Erection of a new secondary school* at Liskeard. Plans and specifications may be seen at the office of J. Saneom, Architect to the Committee, Liskeard, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders, on official forms, which may be had from the architect, are to be sent to F. R. Pascoe, secretary, Education Office, Truro, on or before Nov. 21.

Nov. 21. Gorphwysfa.—*Alterations to Gorphwysfa Chapel*, erection of new vestry with class-rooms above, and chapel house at Skewen, for the Building Committee. Plans and specifications may be seen and bills of quantities obtained at the offices of J. Cook Rees, architect, Neath. Sealed tenders to be sent to E. L. Davies, 10, Bethlehem Road, Skewen, on or before Nov. 21, endorsed "Tender for Alterations and Extensions."

Nov. 21. Thirsk. — *Proposed alterations to Thirsk Infants' Council School* for the Education Committee. Contractors desirous of submitting an estimate for the whole of the several works in connection with this may obtain forms of tender and inspect plans and specification at the office of C. Moore, Millgate, Thirsk, or at the County Hall, Northallerton, during ordinary office hours. Tenders to be delivered to D. Smith, secretary, County Hall, Northallerton, not later than Nov. 21, sealed and endorsed "Tender for Alterations, Thirsk Infants' School."

Nov. 21. Newcastle-upon-Tyne.—*Erection of new slaughter houses* at the Cattle Market, Scotswood Road, for the Finance Committee of the Corporation. Plans and specification may be seen, and bills of quantities and form of tender obtained at the City Property Surveyor's Department, Town Hall, on payment of £2 2s. to the City Treasurer. The successful contractor will be required to find two good and sufficient sureties, to be approved of by the Corporation, or, in lieu of finding such sureties, deposit with the Corporation a sum to be fixed by the committee, as security for the due and complete fulfilment of the contract. Sealed tenders, addressed to the "Chairman of the Markets Committee," and endorsed "Tender for New Slaughter Houses, Cattle Market," must be delivered at the Committee Clerk's Office, Town Hall, before 10 a.m. on Nov. 21.

Nov. 22.—Priestwood. — *Building of a new school* for 200 scholars at Priestwood, Easthampstead, near Bracknell, Berks Builders desirous of tendering are required to send in their names to the Secretary of the Education Committee, The Forbury, Reading, together with a deposit of £3 3s., for bills of quantities. Plans, specification, and form of contract will be open for inspection at the Education Secretary's office between the hours of 10 and 5. Tenders must be delivered at the office of the Education Secretary, on the form and in the envelope provided, not later than the first post on Nov. 22.

Nov. 22. Ackworth.—*Erection of working-men's club* institute and baths, at Ackworth. Plans and specification can be inspected, all information obtained, and assistance rendered on application to J. Heseltine, architect and surveyor, Pontefract. Sealed tenders delivered to him not later than noon on Nov. 22.

Tenders to be lodged with W. R Bell, clerk of the Council, Clerk's Office, Council Chamber, Newry, not later than 5 p.m on Nov. 23. Specification can be seen at the Clerk's office.

Nov. 23. Aldborough.—*Erection of Aldborough proposed new school.* Builders desirous of tendering should send in their names not later than Nov. 5, to C. J. Brown, architect, Cathedral Close, Norwich, at whose office plans and specifications can be inspected and bills of quantities obtained. A deposit of £1 1s. will be required. Tenders must be delivered by 12 noon on Nov. 23, addressed to "The Secretary, Norfolk Education Committee, 57, London Street, Norwich," and endorsed "Tender for Aldborough School."

Nov. 24. Hyde.—*Erection of the Leigh Street Council School* to accommodate 1,200 children. Plans and specifications may be seen at the office of J. Lindley, architect, Town Hall Chambers, Hyde. Bills of quantities, forms of tender, &c., may be obtained from S. Ashford, secretary, Education Offices, Hyde, on a deposit of £3 3s. Sealed tenders, on the official forms and enclosed in the envelopes provided, must be delivered to the Secretary not later than Nov. 24. Fair wages clause.

Nov. 24. Barnwood.—*Erection of a new block* to accommodate about 170 female patients, at the Second County Asylum, Barnwood, near Gloucester. Bills of quantities and forms of tender can be obtained from Giles, Gough & Trollope, architects, 28, Craven Street, Charing Cross, London, W.C., on payment of £3 3s. Plans and specifications can be seen at the architects' office, 28, Craven Street, aforesaid, and at Wotton Asylum Gloucester. Sealed tenders, on forms supplied, are to be delivered to J. Thompson, clerk to the visitors, Wotton Asylum, Gloucester, on or before Nov. 24.

Nov. 27. Fulwood.—*Erection of a new public elementary school*, to accommodate 162 children, at Fulwood, near Preston, for the Lancashire Education Committee. The plans may be seen and bills of quantities obtained at the office of H. Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before twelve o'clock noon on Nov. 27, sealed and endorsed, to J. W. Lloyd, 4, Lune Street, Preston.

Nov. 27. Huncoat.—*Erection of a new public elementary school* to accommodate 300 children at Huncoat, near Accrington, for the Lancashire Education Committee. The plans may be seen and bills of quantities obtained at the office of H. Littler, county architect, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before 12 o'clock noon on Nov. 27, sealed and endorsed, to F. Shutt, Council Offices, Mill Street, Padiham.

Nov. 28. Glanyrafonddu, near Tally.—*Erection of stone and steel bridge* at Glanyrafonddu, near Tally, Llandilo, for the Carmarthenshire C.C. Plans may be seen, at and copies of specification and quantities obtained from, the offices of C. H. Mounsey, county engineer and surveyor, County Surveyor's Offices, Carmarthen, on and after Nov. 7. Sealed tenders are to be in the hands of J. W. Nicholas, clerk of the C.C., Shire Hall, Carmarthen, on or before Nov. 28.

Nov. 29. London, W.C.—*Construction of an underground convenience* for men and women in Theobald's Road, and for additions to the existing underground convenience in Shaftesbury Avenue, in accordance with drawings and specification prepared by the Borough Surveyor for the Metropolitan Borough of Holborn. The drawings and specification may be seen at the office of the Borough Surveyor any day between the hours of 11 and 1, and quantities will be provided free of charge on application to Gardener & Theobald, 110, Great Russell Street. Tenders are to be in one sum for the whole of the works at the two conveniences, and persons tendering are requested to give the two amounts on their tenders, showing how the total tender is arrived at, accompanied with £20 in Bank of England notes. No tenders will be received that are not accompanied by such bank notes. Tenders are to be delivered to L. Walford, town clerk, Council Offices, 197, High Holborn, W.C., not later than 10 a.m. on Nov. 29.

Dec. 1. Roscrea, Co. Tipperary.—*Erection of a new bacon factory* at Roscrea, Co. Tipperary, for the directors of the Roscrea Bacon Factory, Ltd. (1) Excavations, foundation, concrete floors and walls. (2) Corrugated iron buildings or alternatively buildings with Belfast felt roofing. Plans, specifications, and forms of tender may be obtained on payment of a deposit of 40s. Tenders to be submitted by Dec. 1.

Dec. 12. Leigh-on-Sea.—*Erection of a new school* at Leigh-on-Sea, to accommodate 250 children. The tender accepted will be subject to the approval of the Essex C.C. and the Local Government Board. Contractors desirous of tendering are required to communicate with S. I. Adams, M.R.S.I., architect and surveyor, at Weston Chambers, Weston Road, Southend-on-Sea, not later than noon of Nov. 15, and to enclose cheque for £2 2s. The contractor whose tender is accepted will be required to provide a guarantee bond for an approved sum. Plans, &c., may be seen at the offices of the architect. Tenders, sealed and endorsed "Tender for Leigh School," are to be delivered to J. F. Ingram, secretary, Bank Chambers, Weston Road, Southend-on-Sea, by noon of Dec. 12.

Dec. 15. Woodford.—*Erection and completion of a new boys' school* to accommodate about 500 pupils, and for sundry alterations to the girls' and infants' schools at Churchfields, Woodford, Essex, for the Essex Educational Committee. Plans, specification, and form of contract may be inspected at the office of the architects, F. Whitmore, Chelmsford, and A. Hogwood, 33, Great Tower Street, E.C., between the hours of 10 and 5 on any working day, except Saturdays. Builders desirous of tendering must send in their names and addresses on or before Nov. 26, to E. J. Bond, clerk, Woodford Green, Essex, and 95, Leadenhall Street, London, E.C., with a deposit of £5, in return for which a copy of the bill of quantities and form of tender will be sent. The contractor will be required to give the bond of an approved guarantee society or some other approved security in the sum of £1,000, as security for the due performance of contract. Any tender accepted will be subject to the approval of the Essex C.C. and the Local Government Board. Sealed tenders, endorsed "Tenders for Woodford Churchfields Council School," must reach the Clerk not later than Dec. 15.

Dec. 22. Burnley.—*Erection of the proposed technical school* in Ormerod Road, Burnley. Drawings may be seen and specifications, bills of quantities, and forms of tender obtained at the office of the Borough Engineer, G. H. Pickles, A.M.I.C.E., on payment of £1 1s. Tenders, endorsed "Tender for Technical School," and addressed to the Chairman of the Education Committee, must be delivered at the Town Clerk's Office, Town Hall, not later than 9 a.m. on Dec. 22.

No Date. Great Houghton.—*Erection of new Wesleyan Church* and schools at Great Houghton, near Barnsley. Contractors desirous of tendering are requested to forward their names to Garside & Pennington, architects, Pontefract and Castleford, when bills of quantities and other particulars can be obtained, and will be forwarded.

ENGINEERING.

Nov. 15. Shinfield.—*Supply and laying* of about 1,776 lineal yds. of 6-in. cast-iron water-main, and about 3,666yds. of 4-in. ditto, including the supply and fixing in position of sluice valves, hydrants, bends, branches, surface boxes, &c., required in connection therewith in the Shinfield Road and Church Lane, in the parish of Shinfield, for the Wokingham R.D.C. Plans may be seen, and specification, &c., obtained of J. F. Sargeant, clerk, 8, Shute End, Wokingham, on payment of £1. Tenders to be sent to J. F. Sargeant, and endorsed "Tender for Laying Water-Mains," not later than Nov. 15.

Nov. 16. Rotherham.—*Heating the wards* and supplying domestic hot water to the wards, at the new Isolation Hospital, Badsley Moor Lane, Rotherham; and also for an extension of the heating apparatus at the Administrative Block at such hospital, for the Corporation. Further particulars and information can be obtained on application at the offices of J Platts, Corporation architect, High Street, Rotherham. Fair wages clause. Tenders, endorsed "Heating Isolation Hospital," to be sent to W. J. Board, town clerk, Town Hall, Rotherham, not later than Nov. 16.

Nov. 17. Tottenham, N.—*Heating the Parkhurst Road* and Belmont Road Schools with low pressure hot-water, for the Tottenham Education Committee. Applications for copies of specifications and quantities to be made to G. E. T. Laurence, A.R.I.B.A., architect, 22, Buckingham Street, Adelphi, W.C., before Nov. 17. Applications to be accompanied by a deposit of £2 2s. in respect of each school Fair wages clause.

Nov. 19. Basford.—*Making, delivering and fixing* a Lancashire boiler, 24ft. long and 7ft. diameter, together with injector, valves, &c., at the Basford Workhouse. Engineers desirous of tendering should apply to W. V. Betts, architect, Bank Offices, Old Basford, Nottingham, on or before Nov. 19, when specifications will be supplied to them.

Nov. 21. Lossiemouth.—*Supplying and erecting* over the river Lossie, at Lossiemouth, a foot-bridge 186ft, long, consisting of timber gangways and piers, and steel girders over three spans of 34ft., the west span having a tilting bascule. Plans and specification to be seen with, and schedules of quantities obtained from, G. Gordon & Co., civil engineers, Inverness. Tenders to be lodged on or before Nov. 21 with J. H. Glennie, town clerk, Lossiemouth, with whom copies of the plans and specification may also be seen.

Nov. 21. Hartlepool.—*Steel girder work* required for the New Coaling Staiths at Victoria Dock, Hartlepool, for the Directors of the North-Eastern Railway. Plans may be seen and specification obtained on personal application to T, M. Newell, Dock Engineer's Office, Hull. Sealed tenders, endorsed "Tender for Steel Girder Work, Hartlepool," to be delivered at the Secretary's Office, York, not later than 12 noon on Nov. 21.

Nov. 26. Alexandria.—*Three new boilers* for Atfeh Pumping Station. Tenders will be received at the office of the Inspector of Irrigation, 3rd Circle, Alexandria, up to 11 a.m. on Nov. 26. The boilers must be of some well-known type such as Galloway, Lancashire, &c., about 24ft. long by 6ft. 6ins. diameter, and will be required to generate about 150 h.p. each with a steam pressure of about 120lbs. Details should be given of length, diameter, plates, heating surface, riveting, steam pressure, tubes, &c., &c. The date by which they could be delivered in Alexandria should also be stated. Persons wishing to tender for this work and requiring further information should apply to the Inspector of Irrigation, 3rd Circle, Alexandria.

Dec. 1. Dorking.—*Providing and erecting a house refuse destructor* capable of dealing with 60 tons weekly. The U.D.C. invite firms to submit quotations, plans, and full details. Separate prices are desired for—(1) Machinery, including steam raising plant; (2) without steam-raising plant; and (3) building and roadway. Particulars as to site, &c., can be obtained on application to W. J. Hodge, clerk, 64, South Street, Dorking. Tenders, &c., marked outside "Destructor," to be deposited with him not later than Dec. 1.

Dec. 2. Melilla.—*Execution of the Port Works* at Melilla and Chafarinas. Tenders will be opened on Dec. 2 at the offices of the Port Works Board, Melilla, where plans, &c., may be inspected; these are also on view at the Ministry of "Fomento," Madrid.

Dec. 12. Belgium.— *Construction of the section* from Comblain-la-Tour to Ferrières of the Comblain-la Tour—Manhay—Melreux local railway. The estimated cost of the work is 445,260fr. (£17,810), and a deposit of 44,000fr. (£1,760) is required to qualify any tender. Tenders by registered letter will be received at the offices of the "Société national des chemins de fer Vicinaux," 14, Rue de la Science, Brussels, not later than Dec. 11. A copy of the specifications may be obtained on payment of 1fr. from M. L'Hoir, rue Edouard-Wacken, No. 10, Liége. Tenders will be opened on Dec. 12.

IRON AND STEEL.

Nov. 19. London, N.—*Supply and delivery of galvanised wrought-iron shingle bins* and cast-iron orderly bins for the Metropolitan Borough of Islington. A specification and drawing of the shingle bins and a specification and sample of the orderly bins may be seen, and a form of tender obtained, upon application to the Borough Engineer, J. Patten Barber, at the Town Hall, Upper Street, N., and payment of £1 1s. Sealed tenders, endorsed "Tender for Bins," must be received by W. F. Dewey, town clerk, Town Hall, Upper Street, N., not later than 4 p.m. on Nov. 19.

Dec. 31. Johannesburg.—*Supply and delivery* at the Central Fire Station, Johannesburg, of a turntable ladder, for the Johannesburg Municipality. Form of tender and specification may be obtained on application to the Council's agents in London, E. W. Carling & Co., St. Dunstan's Buildings, St. Dunstan's Hill, E.C. Sealed tenders, endorsed "Tender for Turntable Ladder." and addressed to the Town Clerk, Municipal Offices, Plein Square, Johannesburg, will be received by him not later than 12 noon, Dec. 31. The London agents will be pleased to furnish any information regarding the cost of delivery to tenderers on application.

PAINTING AND PLUMBING.

Nov. 15. Manchester.—*Painting the museum* and art gallery at Queen's Park for the Art Gallery Committee. Specifications may be obtained on application to the City Architect, Town Hall, Manchester. Sealed tenders, enclosed in the official envelope, to be delivered at the above office not later than 9 a.m. Nov. 15.

Rhenish basalt; 2. Guernsey granite; 3. Clee Hill basalt; 4. Leicestershire granites; 5. Penlee, St. Keverne, or other Cornish granites; 6. Penmaenmawr, or other North Wales granites; 7. Quartzite; 8. Norway granite; 9. Quenast; 10. Or other equally durable material. Also the following local materials: 3,000yds. (more or less) of Sevenoaks rock, unbroken; 16,000yds. (more or less) of surface-picked or grubbed flints; 2,500yds. of Kent rag, for the Bridges and Roads Committee of the Kent C.C. Specification and forms of tender can be obtained upon application to the County Surreyor, Maidstone. Sealed tenders, endorsed "Tender for Road Metalling." must be sent to W. B. Prosser, clerk to the Council, Sessions House, Maidstone (upon the prescribed form), not later than 12 noon on Dec. 15.

SANITARY.

Nov. 15. Conon.—*Construction of new drainage system* for the village of Conon. Plans and specification may be seen with, and copies of schedule obtained from, D. J. eid, civil engineer, York House, Church Street, Inverness, with whom offers are to be lodged on or before Nov. 15.

Nov. 17. Fulwood.—*Contract No. 6. Supply and laying of about 429 lin. yds.* of the best 12-in. earthenware socketted pipes, 166 lin. yds. being in tunnel and 263 lin. yds. in open cutting; also 51 lin. yds 9-in. E. S. pipes, together with manhole and ventilators, situate in Garstang Road and Highgate Avenue, Fulwood, for the U.D.C. Plans may be seen, and specification, bill of quantities obtained, on application to the engineer and surveyor, E. H. Naylor, Council Offices, Fulwood, upon payment of £1. Sealed tenders, on the form supplied, endorsed "Tender for Sewering," must be delivered to A. Brierley, clerk to the Council, Council Offices, Fulwood, Lancs, not later than Nov. 17.

Nov. 19. Penrith,—*Construction of sewage-disposal works* at Whinfell Holme, Penrith, and laying of stoneware and iron pipe sewers, for the U.D.C. General conditions, specifications, bills of quantities, and forms of tender may be obtained, and drawings inspected, at the Town Hall, upon receipt of a deposit of £5 5s. Full particulars may be obtained from Brierley, Holt, and Co., engineers, Blackburn and Blackpool, or from J. J. Knewstubb, resident engineer, Town Hall, Penrith. Sealed tenders, endorsed "Penrith Sewerage and Sewage Disposal Works—Contract No. 2," must be delivered to G. Wainwright, clerk of the Council, Town Hall, Penrith, not later than 12 noon, on Nov. 19.

Nov. 19. Southgate.—*Construction of a sewer* of a length of about 1,600yds. in and near to Green Dragon Lane, Winchmore Hill. Plans may be seen on application to C. G. Lawson, Council's surveyor, from whom copies of the specification and forms of tender may be obtained on depositing £2 in cash. Tenders, endorsed "Sewer," must reach W. M. Ellenor, clerk to the Council, Council Offices, Palmer's Green, N., not later than Nov. 19.

Nov. 20. Nuneaton.—*Construction of about 1,410 lineal yards* of 9-in. earthenware and cast iron-pipe sewers in Heath End Road, with the necessary manholes, flushing chambers, and other works apurtenant thereto, for the Nuneaton and Chilvers Coton U.D.C. Plans may be seen, and copies of specification, bill of quantities and form of tender obtained, on application to F. C. Cook, engineer and surveyor, Council Offices, Nuneaton, on deposit of the sum of £2 2s. Tenders, endorsed "Tender for Heath End Road Sewers," must be delivered to the Engineer and Surveyor not later than 12 noon on Nov. 20.

Nov. 22. Winchcomb.—*Construction of about 5,070 yards of stoneware pipe sewers*, together with sewerage disposal works, including liquefying tank, bacteria beds, and other works at the Cleeve Hill Sewerage, in accordance with the plans, detail drawings, and specification prepared by the engineer. Plans and specification may be seen, and form of tender and bills of quantities obtained, of J. Villar, engineer, 5, Essex Place, Cheltenham, on payment of a deposit of £3 3s. Sealed tenders, on form supplied, and endorsed "Cleeve Hill Sewerage," must be delivered to H. W. Stevens, clerk to the Council, Winchcomb, not later than 12 noon on Nov. 22.

Dec. 4. London.—*Supply of 23,800 tons of lime* to the Barking and Crossness main drainage outfall works, for the County of London. Tenders, which must be upon the printed form to be obtained upon application to the Council's chief engineer, at the County Hall, London, S.W., must reach the Clerk of the Council not later than 10 a.m. on Dec. 4, must be marked "Tender for Lime," Full particulars of the Council's requirements as to this and other tenders are published in the "London County Council Gazette," which can be obtained from King & Son, 2 and 4, Great Smith Street, S.W., price 1½d. an issue, or, for the year, a prepaid subscription of 6s. 6d.

MISCELLANEOUS.

Nov. 17. London, E.C.—*Supply of materials and stores*, including wrought iron and steel, rivets, bolts, nuts, &c., nails, spikes and ironmongery, paints and varnishes, oils, &c., Portland cement, for the Conservators of the River Thames, to be delivered as required at the Conservancy Works, Port of London Wharf, Millwall; Strand-on-the-Green, Chiswick; Shepperton Lock, Shepperton, Middlesex; Caver ham Yard, Reading; or Osney Yard, Oxford. Specification and forms of tender may be obtained at the Conservators' Offices, Victoria Embankment, E.C. Tenders must be sent in to R. Philipson, secretary, Thames Conservancy Offices, Victoria Embankment, London, E.C., not later than 10 a.m. on Nov. 17.

Nov. 19 Bristol.—*Supply during the year 1907* the following tools and stores:—*Castings, *ironmongery, cement, drain pipes, paints, *oils and candles, for the Sanitary and Improvement Committee of the Corporation. Specifications and forms of tender may be obtained at the offices of the City Engineer, 63, Queen Square, on payment of 10s. Local tenders only will be accepted for those marked *. Tenders must be sent in the envelopes provided to 63, Queen Square not later than 1 p.m. on Nov. 19.

Nov. 21. Dublin.—*Supply of the following stores* for 12 months to Dec. 31, 1907, for the Directors of the Great Southern and Western Railway (Ireland):—Castings, mall. iron, cement, files and tool steel, fishbolts (steel), galvanised roof sheets, buckets, &c., iron tubes and fittings, iron and steel wire, nails, railway fastenings (iron), rain-water pipes and gutters, sewer pipes, plaster of Paris, &c., varnishes. Forms of tender can be obtained on payment of 6d. each from the Company's storekeeper, at the General Stores, Inchicore, Dublin. Patterns may be inspected at the same place between 10 a.m. and 4 p.m. (except Saturdays). The tenders to be sent in, endorsed "Tender for Stores," and addressed to F. B. Ormsby, secretary, Kingsbridge Terminus, Dublin, so as to be with him before 10 a.m. on Nov. 21.

TOO LATE FOR CLASSIFICATION.

Nov. 15. Kendal.—*Erection of a residence* at Helsington Laithes, Kendal, for Mrs. Dixon. Plans may be seen and quantities and specifications obtained of J. F. Curwen, F.S.A,, F.R.I.B.A., architect and sanitary engineer, 26, Highgate, Kendal, up to Nov. 15, upon which date all tenders are to be sent (under cover) to him before noon.

Nov. 15. Sheffield.—*Extension of Nurses' Home.* Contractors wishing to tender for addition to the Nurses' Home at the Sheffield Union Hospital, Firvale, are requested to send their names to Potter & Sandford, architects, 16, St. James's Row, Sheffield, not later than Nov. 15.

Nov. 17. Saunderton.—*Alterations at the Union House* at Saunderton, for the Guardians of the Wycombe Union. Plan and specifications can be seen at the Union House on application to the Master. Tenders to be sent to B. L. Reynolds, clerk to the Guardians, 12, Easton Street, High Wycombe, on or before Nov. 17, endorsed "Tender for Alterations."

Nov. 19. Windermere.—*Erection of a villa residence* at Heathwaite, Windermere, for Miss M. Thirkell Cox. Plans and specifications may be seen at the office of J. Pattinson, architect, Windermere. Tenders to be sent in not later than Nov. 19.

Nov. 20. Hunslet.—*Alterations and additions* required at the Hunslet Union Offices, according to the plans and specifications prepared by the architect, W. E. Richardson, Rothwell, Leeds. Such plans and specifications may be seen, and bills of quantities and forms of tender obtained, on application to the architect. Tenders must be endorsed "Tender—Alterations," and be delivered to F. W. Mee, clerk to the Guardians, by 10 a.m. on Nov. 20.

Nov. 20. Salford.—*Sewering, paving, flagging,* and completing of five streets. The plans and specifications may be seen and forms of tender obtained at the Borough Engineer's Office, Town Hall, Salford. Tenders, endorsed "Street Paving," addressed to the Chairman of the Highway Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 10 a.m. on Nov. 20.

Nov. 21. Stanley, R.S.O.—*Erection of 12 dwelling houses* (stone) at Shield Row, Stanley, R.S.O., for S. D. Shafto, Esq., of Beamish Park, Beamish, R.S.O. Terms and specifications may be seen and particulars obtained on application to T. E. Crossling, architect and surveyor, Stanley, R.S.O., County Durham. Sealed tenders, endorsed "Twelve Houses, Shield Row," to be received not later than 6 p.m. on Nov. 21.

Nov. 22. Manchester.—*Painting and repairs* at various public underground lavatories and urinals. Specification and form of tender may be obtained on application at the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of £1 1s. All cheques or postal orders to be made payable to the order of "The Corporatton of Manchester." Tenders, enclosed in the official envelope and addressed to the Chairman of the Sanitary Committee, to be delivered at the City Surveyor's Office not later than 10 a.m. on Nov. 22.

Electrical Notes.

Birmingham's New Power Station.

Like the London County Council, Birmingham is in a spending humour just now in the matter of electrical energy. Having brought its water from Wales at a cost of several millions, it has lately been turning its attention to the provision of municipal tramways and the extension on a great scale of its electric power and lighting department. This has necessitated the erection in Summer Lane of one of the biggest power stations in the Kingdom: it has cost £200,000. The entire scheme has been designed by the city electrical manager and engineer, Mr. R. A. Chattock, M.I.E.E. The new generating station was opened recently, and everything must be in order for the supply of electricity on January 1st next, when the whole of the tramways come into possession of the city. The new generating station comprises three large buildings, each 275ft. long—namely, the engine-house, the boiler-house, and the economiser-house, the largest of these being the engine-house, which is 100ft. wide. There are two chimney stacks, the larger being 230ft. high, with an inside diameter of 15ft. The engines have been built by the local firm of Messrs. Bellis and Morcom: each engine is of 3,000 h.p., the total power being about 20,000 h.p. In the boiler-house there is accommodation for 24 boilers, though at present only 10 are installed. The architects of the building (which is built of bricks, with terra-cotta dressings) were Messrs. Ewen Harper & Brother, of Birmingham. The building contract was carried out by Messrs. William Sapcote & Sons, of Birmingham.

"Commercial Electrical Assistants."

There seems to be a growing opportunity for the "commercial engineer"—the man possessing a fair degree of technical training and experience, combined with plenty of business push and ability. We have reached that stage, says the "Standard," where it is becoming recognised by those in authority that the selling of electricity, whether for lighting or power purposes, must be pushed with greater energy. But this cannot be done efficiently by the ordinary cânvasser or commercial traveller, for in calling upon the consumer many points of a more or less technical nature are sure to arise for his attention. Hence the need for the canvasser with a certain amount of electrical training. Good presence, attractive speech and abundant energy seem to be the main qualifications, but they cannot stand without a fair electrical knowledge. Several corporations and light and power companies have within the past year been making appointments such as those indicated—"commercial electrical assistants" being the correct title—and there is no doubt a great deal will be done in this direction in the future.

Improvements in the Accumulator.

In the course of a paper on "Recent Storage Battery Improvements," which he read before the Society of Engineers last week, Mr. Sherard Cowper-Coles, A.M.I.C.E., M.I.M.E., M.I.E.E., gave an historical sketch of the accumulator. He divided the cells under the following four heads:—(1) The solid cell, in which access to electrolyte is not provided for; (2) cells of the "multiple-unit" pasted-plate type, in which an attempt is made to deal with the electrolyte difficulty; (3) cells without plates of the solid network type, in which the solidity of the cell and access of active matter to electrolyte are both dealt with; (4) cells without plates of the solid network type, in which the electrodes consist of non-conducting networks covered with a film only of active matter. His conclusion was that immediate future developments would be in the direction of electrodes which contain the electrolyte within themselves.

The Age Limit.

There has been an increasing tendency, when advertising for engineers for municipal undertakings, to impose an age limit, says the "Electrical Engineer." The usual age is 40. Many councillors are imbued with the belief that all work and industry should be municipally controlled. Our contemporary, however, has little hesitation in stating that the majority of committeemen are totally unable to judge as to the fitness of an engineer for his post. Testimonials play far too great a part in their decisions, and the testimonials to which they pay most attention are not those which testify to a candidate's technical experience or to his commercial ability, but those from mere aldermen, councillors, chairmen of committees, *et hoc genus omne*. Moreover, only too often municipal appointments are decided neither by merit and ability nor by testimonials from protecting councillors, but by influence exerted by the friends and connections of a favoured candidate.

THERE ARE THINGS ONE CANNOT FORGET!

One of them is this:—

"ROYAL EDISWAN"

ELECTRIC LAMPS

are the Best and Cheapest in the end.

NOTE.

THE FOLLOWING IS A RECENT EXTRACT FROM THE "ELECTRICAL REVIEW."

EDISWAN LAMPS.—In connection with the independent tests just concluded by the Westminster Electrical Testing Laboratory, York Street, Westminster, we understand that the "Royal Ediswan" Lamp comes out at the top of the list. The mean results of all the lamps tested show that this well-known lamp gives the best results under all headings, such as regularity of manufacture, life, and last, but not least, economy in watts per candle-power.

Tenders—continued from page xviii.

Surbiton.—For the construction of main drainage works, for the U.D.C. Mr. Nicholson Lailey, M.I.C.E., engineer, 53, Victoria Street, Westminster:—

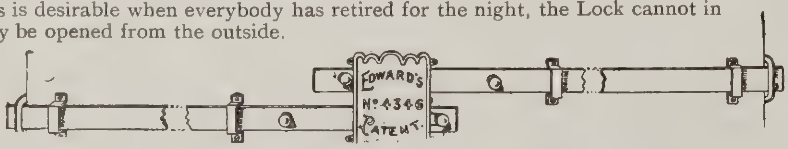
EDWARDS'
PATENT BOLT-LOCK
A Powerful Bolt for the Front Door that can be Locked from the Outside.
Burglars cannot force the door or obtain an entry by Picking the Lock or False Keys when this Lock is fitted.
It bolts on the inside, where either Bolt can be opened or locked by hand; from the outside by means of the key provided, which needs turning twice either to lock or unlock. The Bolt shoots into hasps inset in each door-post and cannot be forced. When only one Bolt is shot, and this is desirable when everybody has retired for the night, the Lock cannot in any way be opened from the outside.



Specially recommended for the **Front Doors of Flats, Houses, Offices, Store Rooms, etc., etc.** It is designed mainly to enable the **Bolting and Unbolting of a Door from the outside,** so necessary **where Houses, Flats, etc., are occasionally left unattended.** The Lock is made in four qualities, nicely finished, for any width of Door. Stocked for 36-in. Doors or narrower.
For full Particulars or to see Sample, write to
CHITTENDEN & CO., 110, Fenchurch Street, London, E.C.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.
November 14, 1906.
CONTRACTORS' SUPPLEMENT (MONTHLY).

CRANES FOR CONTRACTORS.

One of the London morning papers, reporting recently on the unemployment in some of the leading trades, mentioned an interview with a scaffolder, who attributed the want of employment to the "Scotchman." This did not refer to workmen from the north of the Tweed, but to the derrick cranes which are now so largely used in building operations, and which have so greatly saved the cost of scaffolding and reduced the amount of labour in the erection of high buildings.

These cranes are so largely employed now that they are a matter of general interest to contractors. In the earlier stages, when the size and height of buildings were more limited, these derrick cranes were at first mainly operated by

Hand Power

and the pioneers in this line of business were Messrs. Butters Bros., of Glasgow, which accounts for the name of "Scotchman" being given to this class of crane.

These cranes were cheaply constructed with post and back stays of timber and timber jib, and worked by spur wheel and pinion gearing, with a derricking motion by which the radius of the jib could be altered by raising the head of the jib, so that materials could be picked up with the jib at its full radius and lifted up on to the building, and deposited in the position in which they were required by reducing the radius of the jib. The construction of this type of crane made it very suitable for fixing on a scaffold and afforded an exceedingly cheap and simple method of raising the material, it being possible to fix the crane at any height to suit the character of the building.

They were made to take loads up to about 3 or 4 tons with jibs up to about 30ft. to 40ft.; when the length became increased steel jibs were added up to about 50ft.

As, however, the height and size of buildings increased and the quantity of material to be raised correspondingly increased, manual labour became too slow, and

Steam Power

was very largely used.

Steam derrick cranes were built to raise a load of 3 to 4 tons and the radius of the jib with this arrangement increased to 75ft. or even 100ft. long; the jibs in this case being strongly built of lattice steelwork, and the load being raised by means of winding gear with steam engine and boiler. An arrangement of this kind, of course, very greatly facilitated the handling of goods and saved a very great amount of time and labour.

These cranes are fixed on stagings consisting of three towers, the front supporting the weight of the crane itself and the two rear towers taking the stays to which the mast is tied back.

The disadvantage of this class of crane, of course, consists in the fact that with a steam boiler the whole of the machinery has to be hoisted up to the top of the structure, and the fuel for maintaining the steam also has to be hoisted up; and with a boiler working on a wooden structure there is always a certain amount of risk of fire.

The next step in the development was the employment of

Hydraulic Power

for operating cranes of this type, and large hydraulic cranes were fitted up which were worked from the mains of the London Hydraulic Power Company, to which connection was very easily made by means of iron piping; such cranes were built by the Hydraulic Engineering Company, of Chester, to raise a load of 25 cwts. or 3 tons with proportionate consumption of water. The jib was arranged to luff in or out between 50ft. maximum and 16ft. minimum rakes, and to slew through about three-quarters of a circle. The lifting and luffing cylinders were placed vertically in the structure below the crane mast and the slewing cylinders at the back of the mast. These cranes consume about 100 gallons per operation lifting the full load of 3 tons a height of 120ft.; 26 gallons for luffing in through the whole range, and 3½ gallons to slew three-quarters of a revolution. The controlling valves are placed in convenient position of the platform and operated by a separate lever, so that the motions can be made separately or together as may be required.

In the latest development, however, of this type of crane

Electric Power

is being very largely used, as the current is obtained very cheaply and the power can be laid with great convenience to the crane gear, which is all fixed on to the body of the crane itself. The great advantage of electrical power is that the power consumed is in proportion to the load actually lifted, and as these cranes, which are constructed to take heavy maximum loads, are very frequently used to raise quite light materials, the economy in working cost is very great.

An electric derrick-crane with a 75ft. steel jib would lift one ton 70ft. high 12 times for one unit of current.

An electric motor and gear are fixed at the foot of the mast; the motor is usually

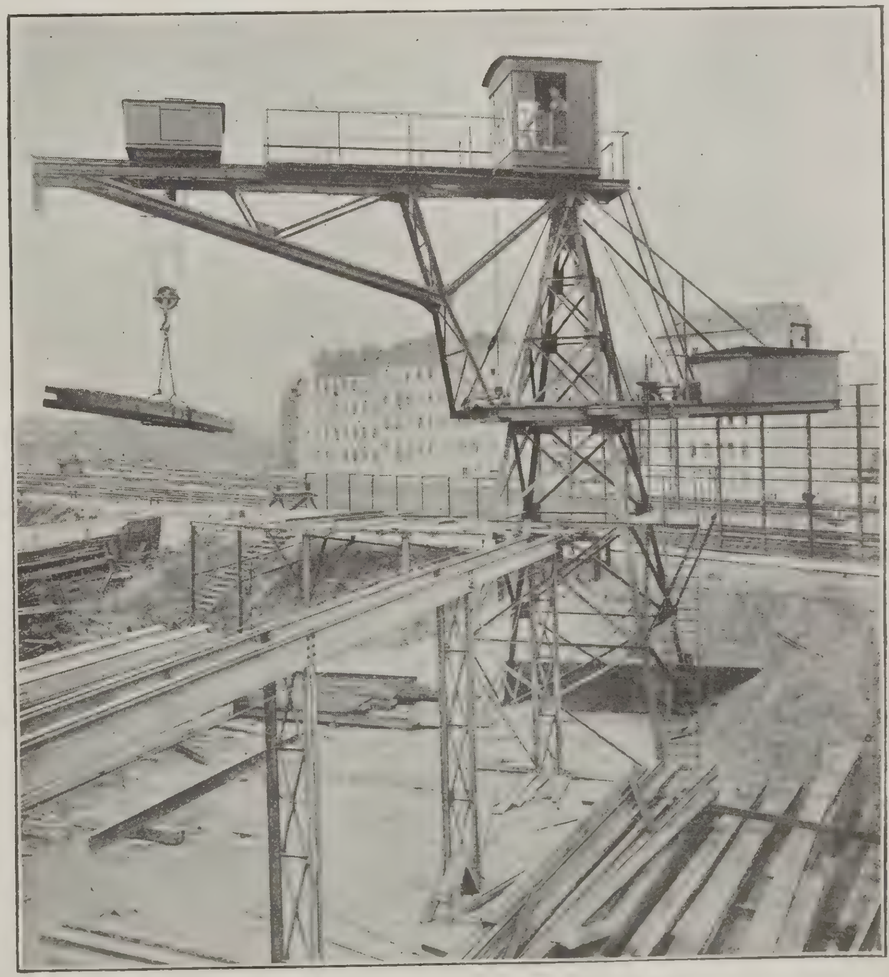

FIG. 1: A GERMAN ELECTRIC TURRET CRANE.

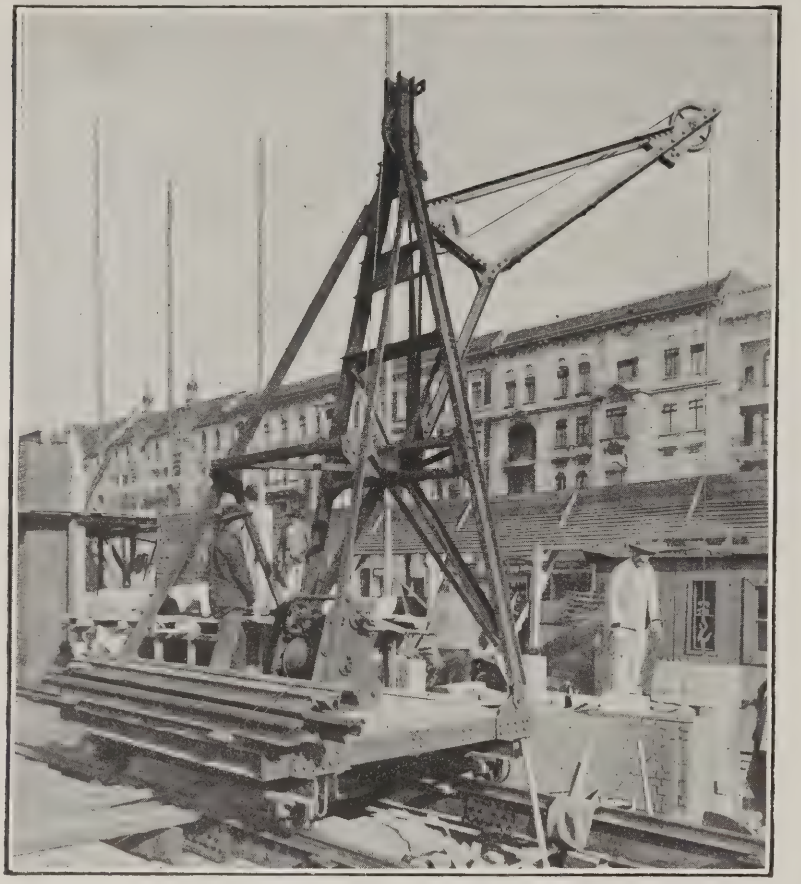

FIG. 2. GERMAN HAND-POWER CRANE.

series wound and completely enclosed, and drives through machine-cut spur gearing to lifting barrel, which is adapted for rope or chain, but wire rope is usually preferred as it runs more smoothly than a chain. Derricking gear is also attached to the mast and connected by steel wire rope to the head of jib. The crane can also be slewed to the right or left. The operation may be either by one motor for all movements or by separate motors for each movement, so that the lifting and slewing can be carried on simultaneously.

The crane is, of course, fitted with a powerful electric brake, and mechanical brake by which the load when lowering can be most exactly adjusted, so that blocks of stone or steel joists can be carefully placed in the exact position where required without shock or jerk.

Where required, electric cranes can easily be made to travel on rails, like those used in the widening of London Bridge. These cranes were designed to lift a maximum of 3 tons at a speed of 75ft. per minute, the radius of the jib being capable of luffing from 12ft. to 18ft. The cranes were also provided with travelling movement controlled by electric current. They could be slewed in either direction when stopping or reversing the motor.

The current is collected by shoes from copper conductors laid between the rails and conveyed to the motor through rubbing contacts.

For lighter work required on buildings, such as hoisting barrows of bricks and other materials,

electrically operated hoists

are also very conveniently arranged, and a very handy hoist of this description, Fig. 3, is constructed by Messrs. R. Waygood & Co., Ltd., of London, the hoist in this case being driven by motor connected through spur gearing to winding drum and controlled by reversing switch for driving in both directions. The lifting ropes can be led in any convenient direction by means of sheaves and the hoist can be moved to various positions as required, and may be mounted on wheeled carriage if desired. One of these hoists is in operation at the new London County Council Fire Station, which is being built in Watling Street.

In many large buildings cage hoists are now employed for raising bricks and other material (Fig. 4); these are frequently operated by

Friction Gear

as shown in Fig. 5. In this arrangement the load is raised by motor power and lowered by the brake, which is satisfactory for carrying goods, but if workmen are allowed to ride in the hoist, then a worm and wheel winding gear, as used for ordinary lifts, should be adopted, as with this form of gear the cage is driven down as well as up at a regulated speed, and cannot run down. With a lift of this kind carrying half a ton a height of 70ft., about twenty complete journeys up and down would be made with one unit of current, costing a penny or twopence, according to the local charges.

In many cases electrical power would hardly be economical in comparison with hand power for the hoisting of materials

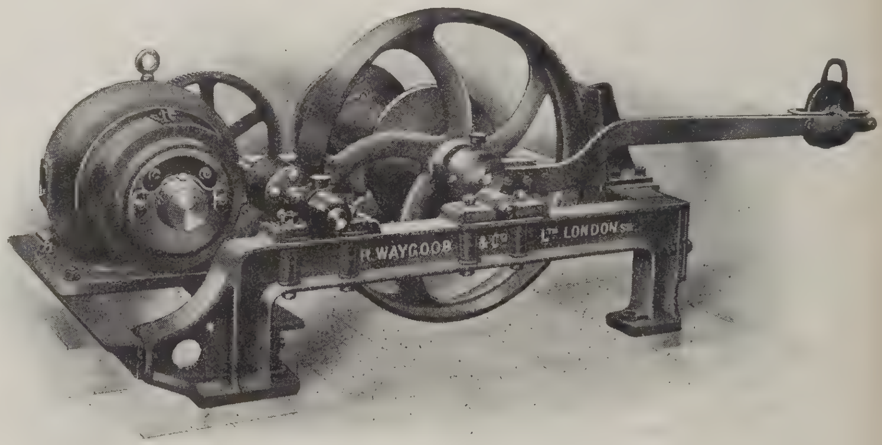

FIG. 5. FRICTION GEAR.

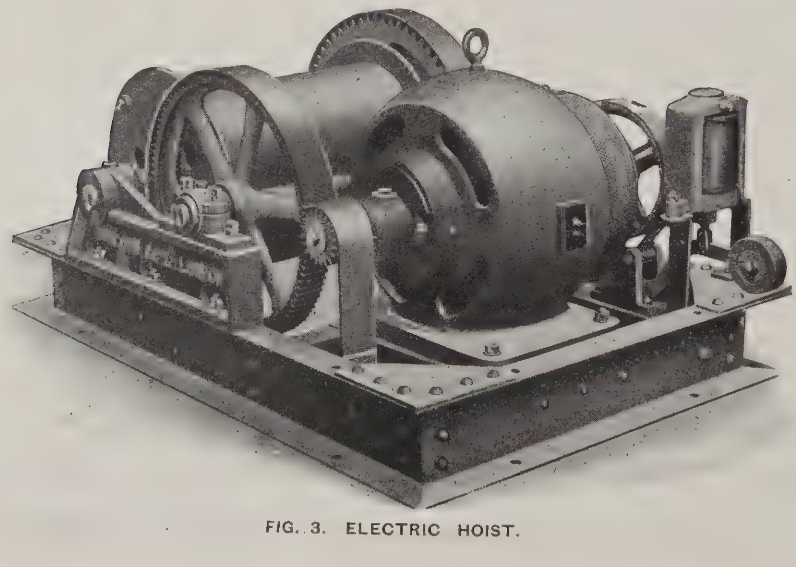

FIG. 3. ELECTRIC HOIST.

on jobs. We do not, however, refer to the old inefficient form of hand power consisting of hauling a rope over a pulley in order to raise a bucket or basket. The most up-to-date form is a patent winch, made by Messrs. G. Stacey & Co., of 66, Lorrimore Road, Walworth, London, S.E. This winch is fitted with two fenced and sprocketed wheels, and strong pitched chain, with 30in. heavy cast iron fly wheel and cased handle, and can be supplied with or without a brake, as required. The bearings of the driving spindle are made moveable, and can be adjusted by two set screw bolts, in the iron frame of the winch, for regulating the pitch chain. The winch only requires one man to work the gear attached to the drum, as shown in Fig. 6. This particular view relates to a job in Charles Street, Kensington, W.

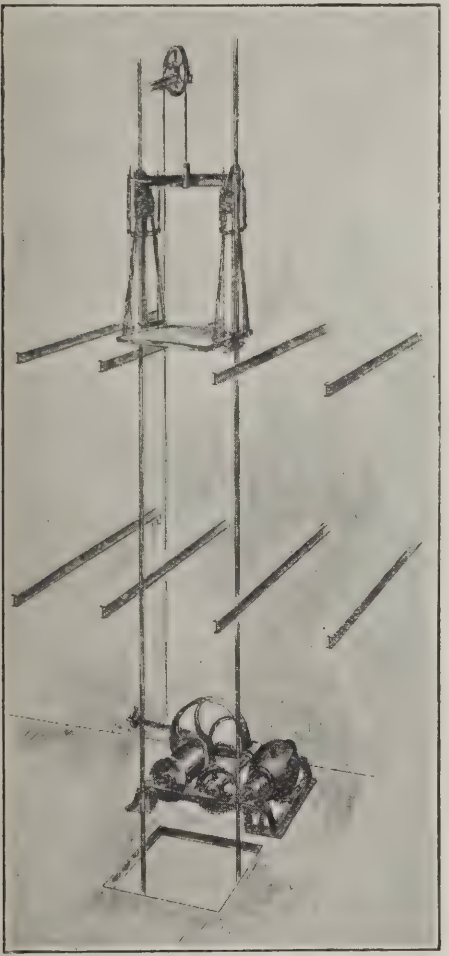

FIG. 4. AN ELECTRICALLY OPERATED CAGE HOIST FOR MATERIALS.

In our "Concrete and Steel" supplement for October 10th we published an article on a new printing works at Aylesbury, which was run up in a remarkably speedy way. The whole of the fireproof flooring and materials on that job were raised by Stacey's patent winch.

Overhead travellers are largely used in contractors' works and can be very economically operated by electric power, being made to lift and traverse by power, but these are not so convenient for use in building operations, and form a separate class by themselves.

In some cases endless hoists, consisting of a series of cages or platforms, suspended on pitch chains, are used for carrying materials from one level to another, where continuous delivery is required, and where a steam or other engine is running continuously on the building; but this arrangement is not economical unless in constant use, and as it can only deliver between fixed points loses many of the advantages of the electric hoist.

We also reproduce two illustrations (Figs. 1 and 2) showing contractors' cranes of two types which are frequently used in Germany. The hand-power crane can be moved along rails and the jib slewed round so as to place materials in a required position, but the jib is immovable vertically. The steel framework, it will be noticed, is designed simply so that it can be economically constructed. The electric crane can turn a complete circle and is provided with a travelling carriage, which runs along the jib, so that the loads can be easily and accurately deposited where required. The end of jib is supported from the staging by a powerful strut and is counterbalanced by a water tank. These cranes are made by Messrs. Carl Flohr, who have recently opened an office at 73a, Queen Victoria Street.

BRITISH TRADE WITH BELGIUM.

The following remarks with reference to the best methods of tendering for contracts and supplying British goods in Belgium, are extracted from the recent report of our Consul-General at Antwerp:—"I have on frequent occasions called attention to the absolute impartiality of the Belgian authorities in according the carrying out of public contracts to firms of any nationality, provided that the tender for the work or construction is sufficiently low to favourably compare with the offers of firms situated in this country. Of the considerable number of notices applying for tenders placed before the British manufacturing public by the Commercial Intelligence Branch of the Board of Trade, on only one occasion has it come to my knowledge that a British firm has competed for the work. . . . In view of the difficulties which have to be overcome in the carrying out of contracts in Belgium by British firms, it would be better, perhaps, for such firms to devote their attention to the companies of Belgian nationality who have been awarded the contract, and endeavour to supply them with the necessary material required in the execution of the works. For instance, most of the large towns in Belgium offer, from time to time, contracts for the supply and laying of paving stones for the streets and footpaths. There would, in such cases, appear to be an opening for British trade in the supplying of the stone or granite for the work, and the endeavour of British firms should be to get into touch with, and supply material to, local firms to which contracts have been awarded."

The New Edition of the "Canadian Trade Index" has just been issued by the Canadian Manufacturers' Association. This contains alphabetical and tabulated lists of many of the leading industrial enterprises in the Dominion. Copies can be obtained free from the Canadian Government, City Trade Branch, 73, Basinghall Street, London, E.C.

Manchester Plumbers' Lock-out. — The claim of the plumbers of Manchester and Salford for a reduction of working hours without a reduction of wages is being sternly resisted by the masters. The men have been practically "locked out" for some time, but as the winter has arrived the necessity for their being at work is emphasised. The masters' case is that the men are paid $8\frac{1}{2}$d. an hour, and that they cannot afford to pay more.

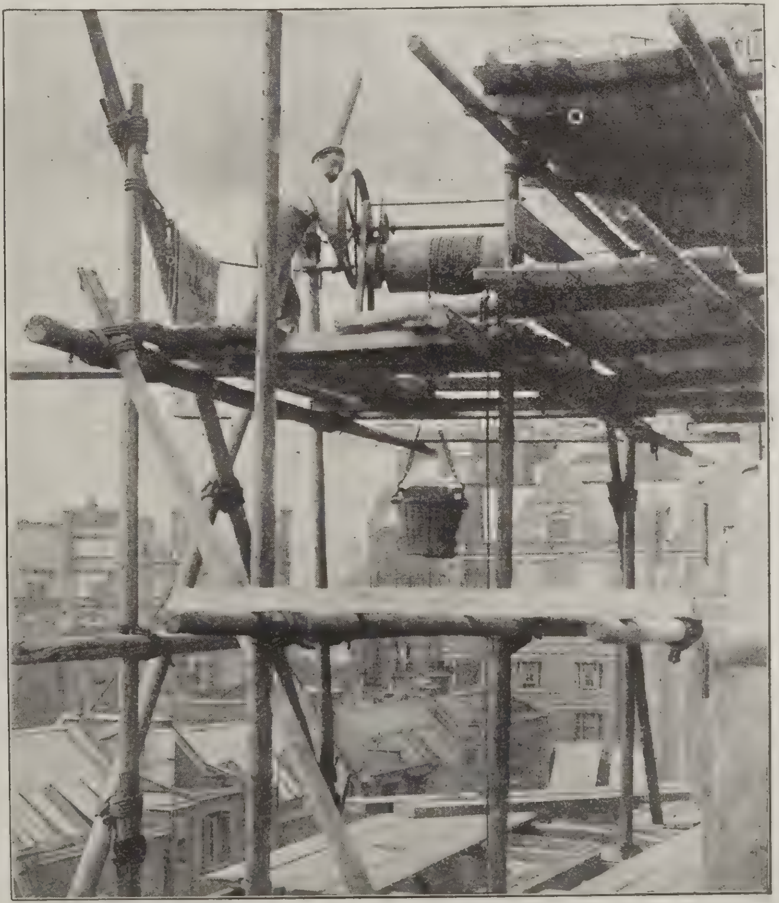

FIG. 6. STACEY'S HAND-POWER WINCH.

The Month's Trade

Reports by our Special Correspondents.

THE CLAYWORKING INDUSTRY.

In the brick and tile trades the improvement, we are glad to be able to report, continues. Some few places have fallen back, but not so materially when we consider the time of year; the retrograde movement will in all probability not continue for long. We are able to state that employment in the clayworking yards of Oldham and South Wales has continued good during the past month, and that it has been fairly good in Devonshire, Suffolk and Essex. This is, of course, only what would be expected in the general improvement of trade in these districts, which we have before referred to, and to this same reason may be traced the fact that the trade in this branch of the building industry has been fair in South Staffordshire, North Wales and the Tees district. At Bradford things have been somewhat slack, while, unfortunately, Nottingham and Peterborough have not yet awakened into life. Indeed, at both of these places trade is reported to have been worse than a month ago. Nothwithstanding the fact that large contracts have been secured in Birmingham, trade has continued bad there. However, the prospects are good, and early next year there should be a welcome revival.

THE STONE, GRANITE AND MARBLE TRADES.

Considering the time of year the state of trade in these branches is fair, and nothing has arisen to suggest that the improvement which has been noticeable in the past few months will not continue. The check is only a seasonable one, and, compared with a year ago, things are better.

In the limestone quarries in Cumberland, Weardale, and South Durham employment was good in the past month, and fair in North Wales and Buxton. Employment in the blue lias quarries in Somersetshire has been dull.

The sandstone quarries in North Wales have been fairly well employed. The Rowsley sandstone quarries have been moderately employed, with an improvement on previous months, and the Gateshead quarries have been moderately employed also. In the Bath stone quarries employment has continued dull, and in the Forest of Dean it was slack. The Pennant stone quarries in the Bristol district have been badly employed. At Barnsley the trade has been slack, and in Forfarshire it has continued bad.

Important stone quarry developments are being carried out at Springwell, a mining village some four miles south of Gateshead. A Northern stone firm has secured 900 acres of land, and much of it is said to contain a rich bed of stone. Five miles of railway are being laid in order to quarry the stone and convey it to the Pontop and Jarrow Railway, which is in close proximity. A powerful steam navvy has been erected, and will shortly be used to convey earth and clay from the surface of the rock. Some old houses, known as the Red Row, have been purchased, and will be pulled down in order that stone-dressing machines may be erected on the site. The whole of the machinery will be worked by an electric plant of 1,100 horse-power. The firm also intends to erect 300 dwelling houses on some waste land near the quarries.

As regards the granite trade, employment has been fair in Aberdeen, and an improvement has been shown on previous months, but trade is not so good as a year ago. In Leicestershire trade has been only fair. In North Wales it has continued good, and in Devon and Cornwall, although there is a slight improvement noticeable, employment has been very quiet.

In regard to settmaking, employment has been fair in Aberdeenshire, and good at Airdrie and Glasgow. At Aberdeenshire it has continued bad, and worse than a year ago. In North Wales employment was fairly good generally. The Cleehill road-making material quarries have been only fairly employed.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of October, as compared with the same month in 1904 and 1905, are as follows :—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
117,578	92,590	95,282	£121,425	£105,080	£100,629

THE SLATE TRADE.

We are not yet able to report any advance in this branch of the building trades, which does not seem to have shared in the general improvement. In the North Wales quarries on the whole the slate trade has been stagnant and has continued slack. Certain districts of Carnarvonshire have been fairly employed, and the only suggestion of any upward movement is that a slight improvement on a year ago is reported in the Festiniog district. The Ballachulish (Argyllshire) quarries still remain quiet.

We are informed that the minimum thickness, above which slabs of slate will be dutiable as roofing slates under No. 233 of the German Tariff at the rate of 65 pfg. per 100 kilogs., has been reduced from five to four millimetres, and that the same duty will be applicable to slabs of a thickness of four millimetres or less which are naturally of a blue-grey colour and are richly sprinkled with iron pyrites.

THE PORTLAND CEMENT TRADE

There has been but little change in the market position of Portland cement since our last report. With the advent of winter, manufacturers are expecting some falling off in the demand, although, so far, deliveries appear to be well up to output, stocks consequently remaining at a very low point for the time of year; in fact, we know of quite a number of concerns which are delivering their product into craft straight from the grinding mills. The course of business will be governed, to some extent, during the next few months by the export demand, but there is every indication that this will keep active throughout the winter months. Another factor for consideration is the position of manufacturers on the continent, and with regard to this our information leads us to form an opinion decidedly against any retrogression of price, for not only is the domestic demand better than it has been for a great many years past, but they appear to be extremely busy with export orders, and in many cases it is impossible to get quotations for delivery during the next few months. This state of things has naturally influenced the price of Portland cement on the continent, and for all the reputable brands of artificial cement good prices are being secured, and, indeed, the range of prices on the continent for genuine cement—apart from the natural product—is for the first time for many years past above the prices which are being secured by manufacturers in this country. The imports of natural cement to the United Kingdom continue to diminish, which is satisfactory from every point of view, while, as will be seen below, the exports from the United Kingdom last month again showed a substantial increase on the corresponding month of last year.

With regard to the home position, although the building trade continues dull, there are quite a number of substantial contracts on the point of being placed which will require large quantities of cement. With regard to London, the amended Building Act, which comes into operation on January 1st next, will result in a big demand for material, and we understand that in the first list of "thrust out" shops which have been scheduled for new concrete roofs no fewer than 14,000 shops have been included, and this is considered only a commencement of the shop schedules, while the total number already scheduled for alterations of various kinds reaches something like 100,000 buildings. On the whole, therefore, prices for the commodity are not likely to recede, and buyers should bear in mind that the advanced level now reached barely covers the manufacturer for his increased cost of manufacture.

The returns of imports and exports of cement for building and engineering purposes for October, as compared with the same month in 1904 and 1905, are as follows :—

IMPORTS.

	1904.	1905.	1906.
Tons	24,463	18,798	16,373
Value	£33,698	22,839	21,949

EXPORTS.

	1904.	1905.	1906.
Tons	31,438	41,436	60,225
Value	£52,541	64,255	96,664

Our Consul-general at San Francisco reports that after five months have elapsed since the earthquake there is very little sign of any permanent construction. Speculative trading after the disaster has caused further losses. It was at once seen, for instance, that cement would be required in large quantities. Several ships were chartered to bring it over, and the first arrivals were sold at good prices. But everybody ordered cement, and the market is overstocked, and there is no place to store it. The cash for these orders was, as a rule, advanced by the banks against the bills of lading. The banks lose, temporarily at any rate, the advance made, and the consignees are still more deeply burdened with debt.

The customs' tariff decision has been come to that Keene's and Parian cement imported into the South African Customs Union shall be classed as "goods unenumerated" and subjected to a duty of 15 per cent. *ad valorem*. A 3 per cent. rebate is allowed upon the produce of the United Kingdom and reciprocating colonies.

The Universal Portland Cement Company, a new subsidiary company of the United States Steel Corporation, has taken over the plants and business of the cement department of the Illinois Steel Company, Chicago, and will continue the manufacture of Universal Portland cement of the same high quality as heretofore.

The present output of 6,500 barrels a day of Portland cement at South Chicago, Ill., and Buffington, Ind., is being increased by a new plant at Buffington, with a capacity of 6,000 barrels a day, and a plant at Universal, Pa., near Pittsburgh, to have a capacity of 4,500 barrels a day. When the new plants are in operation in the summer of 1907 the total output will be 17,000 barrels a day. The cement manufactured in the new mills, as well as the old, will be made from slag and limestone by the same special process that has been employed by the Illinois Steel Company since May, 1900. In the manufacture of Universal Portland cement the two raw materials, crushed limestone and chilled blast furnace slag, are first dried, then thoroughly ground together in proper proportions, and burned to a clinker in rotary kilns. This clinker is afterwards finely ground.

This is a true Portland cement although made from slag, and should not be confused with so-called "slag cements," which are simply mechanical mixtures of slag and slaked lime ground together without burning, the latter being suitable only for use under ground and in moist situations. When the new mills are in operation the output of the Universal Portland Cement Company will exceed 10 per cent. of that of the entire country. Both the new plants will be driven entirely by electric power, from generators connected to gas engines using blast furnace gas. The power will be transmitted 10 miles to Buffington from the South Works of the Illinois Steel Company at South Chicago, from which point the supply of slag will be obtained. For the plant at Universal, Pa., near North Bessemer, the power will be transmitted 7 miles from the Carrie Furnaces, Homestead Works of the Carnegie Steel Company, which furnaces will also supply the slag. The cost of the two new plants will be $3,000,000. Contracts have been placed for 21 rotary kilns 7ft. 6ins. in diameter and 120ft. long, and 47 tube mills. The buildings at each of these cement plants, consisting of raw material bins, dryer building, raw material mill, burner building, finishing mill, stock houses and miscellaneous buildings, such as machine shop, transformer station, office and laboratory, are being built entirely of steel and concrete.

THE IRON AND STEEL TRADES.

The past month has shown no disquieting features. In the manufactured branches of the iron and steel trades prices have been maintained, notwithstanding the decrease in orders received by makers, for they are well supplied at present and have to work full time, while there is every prospect of the demand shortly looking up, so as to offer them a continuance of work as soon as they have fulfilled standing orders. In fact, it is already reported from several quarters that good orders have been received. The strike in the shipbuilding trades on the Clyde naturally restricts the demand for structural steelwork, and there are also fewer orders for ships being given out, probably because of the large amount of tonnage just, or nearly, completed, which is bound to lower freights shortly, but the cheaper rate at which yards are now prepared to accept orders has led new contracts to be placed. In any case it does not appear as if prices will fall, as the increased rates for raw material should prevent it—if anything, they are likely to rise.

In regard to the pig iron market, the shortage in supplies in the United States, as has been expected for some time, has at last resulted in considerable buying from this quarter. It was at first thought that the buying might be speculative, but it now appears to be legitimate, and cargoes have shipped. The result is that prices have advanced. The decrease in the stocks of the public stores is very considerable, and prospects are excellent. As regards Lancashire, though the demand for pig iron is somewhat slow, the market is firm, in view of the large shipments to America and Germany. In the manufactured iron branch makers are hardly able to cope with the demand.

In South Staffordshire pig iron prices have advanced, and manufactured iron and steel are also in strong demand.

As regards the North of England market, the American demand has been chiefly received, and raw material is strong. The manufactured iron and steel market in the Middlesbrough district is a little troubled by the shipbuilding labour troubles, but as yet the mills are kept in full swing.

In Scotland the labour troubles have restricted business somewhat.

As regards the Foreign market, America is unable to cope with the home trade. Germany and Belgium are both busy, although the international selling price of structural steel remains unchanged.

A decision has just been reached by the United States Steel Corporation to build three or four new blast furnaces in the Pittsburg district. The additions will be chiefly at the Duquesne plant, though it is probable that one furnace will be built at Dorona. The open hearth steel capacity of the corporation will be increased at the same time by the building of 30 50-ton furnaces. These latter additions will be made chiefly at Pittsburg district plants, but it is probable that some of the new open-hearth capacity will be erected in the Cleveland district at the works of the American Steel and Wire Company.

The returns for imports and exports in certain branches of manufactured iron and steel for the month of October, as compared with the same month in 1904 and 1905 are as follows :—

		Imports.			Exports.	
	1904.	1905.	1906.	1904.	1905.	1906.
Puddled Iron - tons	8,768	9,965	10,962	67,095	95,740	153,294
Wrought iron, in bars, angles, rods and sections	7,325	10,418	8,469	11,431	13,446	15,551
Rails	2,542	1,497	534	25,627	50,158	40,248
STEEL :—Girders, beams, joists and pillars from Belgium	6,929	8,280	4,998	3,601	5,255	8,033
" " " " other countries	2,008	2,055	4,435			
Ingots, blooms, billets, slabs, sheet bars, tin plate bars, or similar partly manufactured	41,744	57,431	32,834	413	314	1,741
Bars, angles, rods and shapes or sections	11,323	2 847	3,830	13,885	14,121	19,609
Galvanized sheets (flat or corrugated)	—	—	—	34,059	34,964	37,925

OTHER METALS.

The Copper market has managed to check the extraordinary speculative advance for the moment, but a famine in the metal still threatens, and the position is so strong intrinsically that prices are bound to be high and almost certain to advance.

Tin has been in almost as much demand as copper, but prices should now remain stationary, as the busiest season is now approaching its close.

Lead also continues strong, and the stock in the market is reduced.

THE IRONMONGERY TRADES.

Employment in the lock and latch trades at Wolverhampton has been bad, and worse than a month ago. With makers of hollow-ware trade has continued good, and with hurdle and fence makers it has been fair. Employment with hollow-ware stampers has continued slack at Sheffield.

Employment has continued quiet in the stove, grate, &c., trades at Rotherham. At Leeds it has continued slack, with short time; at Glasgow it has been bad, and worse than a month ago; and at Falkirk it has continued fair. At Bolton and Bury it has been good.

With nut and bolt makers at Winlaton employment has continued good; and at Dudley and Darlaston it has been good, and better than a month ago. At Birmingham it has been fair and improving with wire nail makers, fair with cut nail makers, and moderate with rivet makers. At Blackheath it has continued quiet with rivet makers, and fair with wrought nail makers.

Employment has continued good with wire makers, but at Glasgow it has been dull with wire weavers.

The returns for imports and exports for October, as compared with the same month in 1904 and 1905, are as follows :—

		Tons.			Value.	
Imports.	1904.	1905.	1906.	1904.	1905.	1906.
Wire nails	2,452	3,002	3,303	£25,092	30,618	37,489
Nails (other than wire nails), screws and rivets	950	1,439	780	15,952	21,554	12,680
Bolts and nuts	288	420	333	4,359	5,949	5,959
Exports.						
Nails, screws and rivets	1,938	2,317	2,068	39,747	43,345	37,870
Bolts and nuts	1,312	1,708	1,622	23,139	30,530	28,334

THE WALLPAPER TRADE.

The wallpaper trade shows little or no movement. The Board of Trade returns of exports and imports for the ten months of this year ending September 30th show that the importation of paper-hangings is nearly 21 per cent. greater than last year; the exports have improved less—namely, about 5·5 per cent. better than last year, and about 4 per cent. better than 1904.

The following is the return of paper-hangings for October, issued by the Board of Trade :—

	1904.	1905.	1906.
Imports.			
Cwts.	—	3,563	4,302
Value	—	£9,371	11,408
Exports.	1904.	1905.	1906.
Cwts.	5,200	4,951	4,768
Value	£13,725	12,514	11,362

THE PAINT TRADES.

The paint trades continue fair. As regards materials, the returns for imports and exports for October, 1906, as compared with the same month in 1904 and 1905, are as follows:—

		Quantity.			Value.		
IMPORTS.		1904.	1905.	1906.	1904.	1905.	1906.
White lead	Cwts.	24,028	27,976	22,073	£18,941	23,477	20,984
Zinc oxide		126,365	24,510	24,407	75,319	22,956	27,427
Other colours and pigments			109,154	135,559		55,493	70,242
Turpentine		11,701	52,303	45,452	21,495	121,446	99,135
Lac-dye, seedlac, shellac and sticklac		11,392	9,104	5,813	99,655	71,245	57,640
Linseed oil	Tons	171	589	972	3,791	9,434	18,226
EXPORTS.							
White lead	Cwts.	24,029	31,138	37,063	23,039	30,976	40,337
Zinc oxide		116,429	5,603	11,664	132,349	6,497	15,127
Other colours and pigments			130,393	126,143		155,897	155,982
Linseed oil	Tons	2,451	2,094	2,582	44,199	41,176	59,057

THE GLASS TRADE.

The glass trade continues fair. Employment with sheet glassmakers and flatteners in South Lancashire has been good in the past month. With glassblowers in London a slight decline was shown.

The returns for imports and exports of glass for the month of October, 1906, as compared with the same month in 1904 and 1905, are as follows:—

	Cwts.			Value.		
IMPORTS.	1904.	1905.	1906.	1904.	1905.	1906.

THE TIMBER TRADE.

London Market in October.

October has been a month of very large importation, of dear money, and of dropping prices on the London wood market. It has also been a month of considerable trade, as, although the dock deliveries are 1,100 standards short of those of the same month last year, the overside deliveries are 3,100 standards greater, leaving a credit balance of 2,000 standards in favour of the month just ended. Nevertheless, Messrs. Churchill & Sim point out that the dock stock has accumulated freely, and is now about 5,000 standards larger than it was last year. In the meantime Swedish shippers have paid no attention whatever to any weakness here, but have cleared off the balance of their available supplies at the fullest rates of the season to country and continental markets. Russian shippers have made concessions only for goods already chartered for to London, which have mostly been sold at very moderate cost freight and insurance prices. There is every indication that shippers will ask and obtain for next year the highest rates current this season and upwards, so that stock in London should be good holding in the meantime, although the great scarcity and the high price of money makes this difficult. The position is that, at the rates to which the London market has now fallen, wood can be bought at well under the cost of anything that is at all likely to be brought in either this year or next.

Messrs. Denny, Mott & Dickson's report is as follows:—Business during October has been quiet. The steadily improving tone of the previous two months doubtless received a check by the disturbance to ordinary business caused by the almost dramatic suddenness of the Bank Rate being put up to 6 per cent., causing a check in general business facilities and some apprehension as to "a squeeze in money" sufficient to threaten a disastrous strain on weak traders, and to clip the already keenly cut profits of the strongest. The legitimate trader has to largely bear the penalty of undue advances to mere speculators both at home and abroad. It is, however, to be hoped that "the squeeze" will pass and home trade not be handicapped by a higher Bank Rate than 5 per cent. after the turn of the year. Meantime caution is very necessary.

The abstract of dock stock, consumption, &c., for October, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on October 31st was:—

	Pieces.
Foreign deals and ends	2,355,000
Do. battens	3,280,000
Pine deals and battens	751,000
Spruce do. do.	932,000
Boards, rough	4,685,000
Do. prepared	6,931,000

totalling 18,934,000 pieces, as against 17,715,000 in 1905, 20,195,000 in 1904, and 22,280,000 in 1903.

In other kinds the stock was as follows:—

Foreign wainscot logs	268 pieces.
Do. oak timber	1,028 loads.
Do. fir timber	3,571 do.
Do. Oregon pine, &c., spars and masts	4,140 do.
Colonial oak timber	1,098 do.
Do. birch timber and planks	9,119 do.
Do. elm and ash timber	1,010 do.
Do. yellow pine	690 do.
Do. red pine	32 do.
United States pitch-pine timber	20,259 do.
Do. do. deals	69,000 pieces.
East India teak	7,247 loads.

Deliveries.

The deliveries have been—

	First ten months. Pieces.	October. Pieces.
Foreign deals and ends	2,606,000	283,000
Do. battens	4,014,000	353,000
Pine deals and battens	812,000	79,000
Spruce do. do.	902,000	92,000
Boards, rough	4,028,000	409,000
Do. prepared	11,150,000	1,124,000
Total	203,512,000	2,340,000

The deliveries direct from ship to craft have been—

	First ten months. P.s.h.	Cctober. P.s.h.
Deals and battens	108,812	14,436
Boards	20,451	2,234
Total	129,263	16,670

Soft Woods.

Swedish Deals, Battens and Boards.—Arrivals during October were very large, quite swamping all comparison with those of last year. The market has not been able to bear this strain, and prices for all three have fallen rather heavily from the level current in the summer. Prepared boards have perhaps suffered most, but they are showing signs of recovery. Battens are down from 5s. to 10s. per standard from the summer prices, while deals come nearest to holding their own, partly because they have never been very high in this market at any time of the year.

Norwegian Boards.—The arrivals of prepared boards from Norway were also large during October: nearly double those of October, 1905. Prices fell away steadily during the first three weeks of the month, but a lack of pressure to sell, and an improving demand, have brought about the beginning of a change for the better.

Russian Deals and Boards.—The supply of deals during October was about double, and of boards about three times that of October, 1905, while battens are also in excess. This supply has been brought in cheaply, the shippers bearing the brunt of the fall in prices, so that the importing merchants should reap a corresponding advantage.

Finnish Battens.—Even from Finland the arrivals of small battens during October were largely in excess of those of October last year, and, the market being unprepared for this, prices have dropped away freely. At the reduced rates, however, the demand is proving very satisfactory.

Prussian Timber.—The quantity of fir timber imported during October was only half that of October last year, and with a fairly good undertone to the market quotations for suitable wood have shown a tendency to improve. For oak also the demand has been much more satisfactory, and the dock stock is reducing quite rapidly at fairly remunerative prices.

Canadian Timber.—The importation of pine deals during October was quite small, and prices have begun to move ahead again. The demand is, of course,

ABSTRACT OF STOCK, CONSUMPTION, &C., IN LONDON DOCKS, FOR OCTOBER.

All Docks.	Deals (Fir).	Battens (Fir).	Pine.	Spruce.	Pitch-pine Deals.	Deals and Battens in Aggregate.	Rough Boards (All Countries).	Flooring.	Floated Timber.
	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Loads.
Public dock stock	1,998,041	3,568,592	752,455	932,601	68,753	7,320,442	4,685,263	6,931,495	29,000
Monthly public dock consumption	229,619	383,257	75,117	90,354	16,424	794,771	421,977	1,095,449	3,050
Overside stock	1,012,620	1,690,163	331,266	398,461	—	3,432,510	1,860,919	646,315	—
Overside consumption (estimated of dock):—									
98 per cent. Sawn 63 ,, Planed	225,027	375,592	73,615	88,547	—	762,781	413,537	690,133	—
Duration of supply at same rate of consumption	6.62 months.	6.93 months.	7.29months.	7.44 months.	4.19 months.	6.90 months.	7.83 months.	4.24 months.	9.51 months.

still very restricted, and must be so at the present level of cost. Spruce deals have arrived in about normal quantities from the St. Lawrence, but are short from New Brunswick. Of oak, elm and ash timber there is no superfluity on the London market, and retail business is possible at improving prices. There was a considerable importation of sawn timber during the month, which has brought up the dock stock again.

Hard Woods.

Teak.—The landings in the docks in London during October consisted of 284 loads of logs and 271 loads of planks and scantlings, or a total of 555 loads, as against 837 loads for the corresponding month of last year. The deliveries into consumption were 614 loads of logs and 389 loads of planks and scantlings—together 1,003 loads, as against 612 loads for October, 1905. The consumption shown for the month is fairly satisfactory, but the bareness of the stock of logs becomes very accentuated. Of 4,672 loads, a full third came from Java, and consumers have not yet learned to freely use this description of teak. Prices naturally continue to harden, more especially as no large supplies are in sight, and the reports from the shipping ports as to the new season's supplies continue to be of a discouraging nature.

Mahogany.—Business in this market has been restricted owing to the light supplies. Tobasco and African descriptions are very bare, and fresh supplies would be welcomed. The condition of the market does not tend to easier prices, but the demand for consumption is too quiet to cause any radical stiffening, and a steady market for some time to come is probable.

MISCELLANEOUS.

The Customs Tariff decision has been come to that asbestos sheets for roofing imported into the South African Customs Union from foreign countries will be classed as "substances for building purposes" and subjected to a duty of 3 per cent. *ad val.* If manufactured in the United Kingdom or Colonies they will be admitted free.

San Francisco.—Our Consul-General at San Francisco, reporting on September 13th last, says: Five months have now elapsed since the earthquake, and there is very little sign of any permanent construction. The mass of debris, millions of tons of it, remains more or less where it was. The amount removed is barely noticeable, although in the aggregate it is large. Some of the principal streets are cleared sufficiently to allow of the passage of electric cars and wheeled traffic, but except in some of the main streets the pavements are still more or less obstructed. Business is active, but the wholesale and retail trade is much hampered for want of warehouses and depôts for storing stocks. The volume of trade has probably not much decreased, but the nature of the goods sold is not what it was before the disaster. Everything is of a cheaper kind. Had things otherwise been normal, had the insurance money been paid up well, and had not labour troubles come in an acute form on top of a disordered commerce, things might have righted themselves more quickly. But insurances in many cases have not been paid. If the earthquake made outside capitalists cautious as to investments in San Francisco, the labour question, now so acute, has frightened them still more. Even before the earthquake and the advance in wages a building could be put up in Los Angeles, where Labour Unions are not supreme, for 30 per cent. less than in San Francisco. Now the cost of building is almost prohibitive, and a man will think carefully before he puts up, at enormous cost, a building which can hardly make any return on the capital invested.

Builders' Notes.

Messrs. Patman & Fotheringham, Ltd., of 100 and 102, Theobald's Road, W.C., have secured the contracts for Messrs. Hunter & Hyland's large new warehouse, offices and showrooms in High Holborn, W.C. (Mr. Henry Smith, architect), and the New Hospital, Vincent Square, Westminster (Messrs. Read & Macdonald, architects).

Evils of the Speculative Building Trade.—The Building Material Trades' Association of Liverpool and the Manchester and District Builders' Merchants' Association have issued a joint letter on the evils existing in the speculative building trade, together with a paper on the land-jobber and the speculative builder, read recently before a conference of the members of the two associations by Mr. W. H. Dowler. Mr. Dowler said: "It is all very well to suggest that the only way to deal with the so-called speculative jerry-builder is to stop giving him credit. But is this seriously meant, and does it in any case deal with the legal question? Besides, where is credit to begin, and where is it to end? What we want is something giving suppliers of materials, and creditors generally, an equal legal charge with the landowner on any assets, which no private contract entered into previously between a landowner and builder can make void." Mr. Dowler finds his remedy in what is known as the Mechanics' Law of Baltimore, which provides for liens upon buildings in progress or completed, but not paid for.

The Claims of Piece-Work.—In giving the toast of "The Federation" at the recent annual dinner of the Lancaster and District Master-Builders' Association, Mr. T. Till said it seemed that the building trade suffered more than others, because their work was chiefly contract time-work and they had to pay men a standard wage, whether they were worth it or not. On this account the building trade had become the most speculative trade in existence. Many of the associations were feeling that matters should be put on a new footing. It would be advantageous to the trade if they could adopt a system of piece-work, and have a guarantee that they were getting value for their money. The advantage would not be altogether on the masters' side, but very much on the side of the best men. The standard wage system was not fair to the best men. Some men were worth more and others less, and, therefore, the best men suffered at the expense of the inexperienced. He knew this was in antagonism to the views of trades-unionists, but he did not think the present system conduced to clever workmanship. They would not encourage men of ability until piece method was applied to the building trade. As to the condition of trade in Lancaster, he did not think there had ever been such a bad time experienced as during the last two or three years. They could not expect much improvement when the principal jobs were going out of the town.

The Labour Market

Board of Trade Returns for September.

Employment in the month of September continued dull, and was not so good as in August, but was slightly better than in September last year.

In London

employment showed, on the whole, a decline as compared with August last and September, 1905. Returns received by the Board of Trade from 51 London employers showed that in the last week of September 10,359 workpeople were paid wages, as compared with 10,525 in August, 1906, and 12,136 in September, 1905.

From Trade Union returns relating to carpenters and joiners it appears that the percentage of unemployed in London at the end of September was 6.5, as compared with 5.5 in August, and 7.1 in September, 1905. With plumbers the percentage for September was 9.2, for August 7.5, and for September, 1905, 9.9, the improvement shown in August not having been maintained. With painters and builders' labourers a considerable decline was shown. There was little change with bricklayers, but with plasterers and masons a slight improvement was shown.

The Provinces.

Returns received from 69 employers' associations in towns outside London show that in these towns employment continued slack generally, and showed little change compared with a year ago.

The Trade Unions report:—Employment with bricklayers continued to decline; with stonemasons it improved slightly. With carpenters and joiners it continued slack, showing a slight decline on August, but it was better than in September, 1905. With plasterers the improvement shown in August was maintained; with slaters, painters and with builders' labourers a slight decline was shown.

In the Northern Counties

employment was quiet generally, showing little change. In the Wear district it continued bad with plasterers.

In Yorkshire.

employment was quiet and not so good as in August.

In Lancashire and Cheshire

employment on the whole was fair, but showed a slight decline on August.

In the Midlands and Eastern Counties

employment in the Leicester district showed a slight improvement with masons and labourers. It was moderate, on the whole, in the Potteries. At Birmingham it was slack, at Coventry it was fairly good. In Norfolk it continued to decline.

As regards the Southern and South-Western Counties,

employment in the Plymouth district was moderate with bricklayers. In the South Wales district it was good with painters and fair with plumbers.

Scotland.

Employment in the West of Scotland was fair with bricklayers and slaters. At Edinburgh it was good with masons and fair with joiners; at Dundee it improved with masons and plasterers. At Aberdeen all branches are slack.

Ireland.

At Belfast it was fair with plasterers and moderate with bricklayers. At Dublin it continued dull.
